Contents

Preface	ix
Preface to the Second Edition	xii
Acknowledgments	xiii
 Part One Formalisms: Russian Formalism and New Criticism	
1 Introduction: Julie Rivkin and Michael Ryan, Formalisms	3
2 Boris Eichenbaum, The Formal Method	7
3 Viktor Shklovsky, Art as Technique	15
4 Cleanth Brooks, The Formalist Critics	22
5 Cleanth Brooks, The Language of Paradox	28
6 W. K. Wimsatt Jr., The Structure of the Concrete Universal	40
 Part Two Structuralism, Linguistics, Narratology	
1 Introduction: Julie Rivkin and Michael Ryan, The Implied Order: Structuralism	53
2 Jonathan Culler, The Linguistic Foundation	56
3 Ferdinand de Saussure, Course in General Linguistics	59
4 Vladimir Propp, Morphology of the Folk-tale	72
5 Roman Jakobson, Two Aspects of Language	76
6 Roland Barthes, Mythologies	81
7 Michel Foucault, The Archaeology of Knowledge	90
8 Seymour Chatman, The Structure of Narrative Transmission	97
 Part Three Rhetoric, Phenomenology, Reader Response	
1 Introduction: Julie Rivkin and Michael Ryan, Language and Action	127
2 Immanuel Kant, Transcendental Aesthetic	131
3 Edmund Husserl, Ideas	137
4 Edward P. J. Corbett, Classical Rhetoric	142
5 J. L. Austin, How To Do Things With Words	162
6 Richard Lanham, Tacit Persuasion Patterns and A Dictionary of Rhetorical Terms	177
7 Stanley Fish, Not so much a Teaching as an Intangling	195
8 Stanley Fish, Interpretive Communities	217
9 John Frow, Text and System	222
10 Pierre Bourdieu, Distinction	237

Part Four Post-structuralism, Deconstruction, Post-modernism

1	Introduction: Julie Rivkin and Michael Ryan, Introductory Deconstruction	257
2	Friedrich Nietzsche, On Truth and Lying in an Extra-moral Sense	262
3	Friedrich Nietzsche, The Will to Power	266
4	Martin Heidegger, Identity and Difference	271
5	Georges Bataille, Heterology	273
6	Jacques Derrida, Differance	278
7	Jacques Derrida, Of Grammatology	300
8	Jacques Derrida, Semiology and Grammatology	332
9	Barbara Johnson, Writing	340
10	Helene Cixous, The Newly Born Woman	348
11	Jean-Francois Lyotard, The Postmodern Condition	355
12	Jean Baudrillard, Simulacra and Simulations	365
13	Gilles Deleuze and Felix Guattari, A Thousand Plateaus	378

Part Five Psychoanalysis and Psychology

1	Introduction: Julie Rivkin and Michael Ryan, Strangers to Ourselves: Psychoanalysis	389
2	Sigmund Freud, The Interpretation of Dreams	397
3	Sigmund Freud, On Narcissism	415
4	Sigmund Freud, The Uncanny	418
5	Sigmund Freud, Beyond the Pleasure Principle	431
6	Sigmund Freud, Group Psychology and the Analysis of the Ego	438
7	Jacques Lacan, The Mirror Stage as Formative of the Function of the I	441
8	Jacques Lacan, The Instance of the Letter in the Unconscious	447
9	Frantz Fanon, The Negro and Psycho-pathology	462
10	Nancy Chodorow, Pre-Oedipal Gender Configurations	470
11	Bessel A. van der Kolk and Alexander C. McFarlane, The Black Hole of Trauma	487

Part Six Historicisms

1	Introduction: Julie Rivkin and Michael Ryan, Writing the Past	505
2	Raymond Williams, The Country and the City	508
3	E. P. Thompson, Witness Against the Beast	533
4	Michel Foucault, Discipline and Punish	549
5	Nancy Armstrong, Some Call it Fiction: On the Politics of Domesticity	567
6	Louis Montrose, Professing the Renaissance: The Poetics and Politics of Culture	584
7	Stephen Greenblatt, Shakespeare and the Exorcists	592
8	Eric Sundquist, Melville, Delany, and New World Slavery	621

**Part Seven Political Criticism: From Marxism to Cultural
Materialism**

1	Introduction: Julie Rivkin and Michael Ryan, Starting with Zero	643
2	G. W. F. Hegel, Dialectics	647
3	Karl Marx, Grundrisse	650

4	Karl Marx, The German Ideology	653
5	Karl Marx, Wage Labor and Capital	659
6	Karl Marx, Capital	665
7	Antonio Gramsci, Hegemony	673
8	Mikhail Bakhtin, Discourse in the Novel	674
9	Mikhail Bakhtin, Rabelais and his World	686
10	Louis Althusser, Ideology and Ideological State Apparatuses	693
11	Pierre Macherey, For a Theory of Literary Production	703
12	Slavoj Žižek, The Sublime Object of Ideology	712
13	Antonio Negri, Difference and the Future	725
14	Alan Sinfield, Cultural Materialism, <i>Othello</i> , and the Politics of Plausibility	743

Part Eight Feminism

1	Introduction: Julie Rivkin and Michael Ryan, Feminist Paradigms	765
2	Gayle Rubin, The Traffic in Women	770
3	Luce Irigaray, The Power of Discourse and the Subordination of the Feminine	795
4	Luce Irigaray, Women on the Market	799
5	Sandra Gilbert and Susan Gubar, The Madwoman in the Attic	812
6	Coppelia Kahn, The Hand That Rocks the Cradle	826
7	Gayatri Chakravorty Spivak, Three Women's Texts and a Critique of Imperialism	838
8	Audre Lorde, Age, Race, Class, and Sex: Women Redefining Difference	854
9	Geraldine Heng, "A Great Way to Fly": Nationalism, the State, and the Varieties of Third-World Feminism	861

Part Nine Gender Studies

1	Introduction: Julie Rivkin and Michael Ryan, Contingencies of Gender	885
2	Gayle Rubin, Sexual Transformations	889
3	Michel Foucault, The History of Sexuality	892
4	Judith Butler, Performative Acts and Gender Constitution	900
5	Eve Kosofsky Sedgwick, Epistemology of the Closet	912
6	Michael Moon, A Small Boy and Others: Sexual Disorientation in Henry James, Kenneth Anger, and David Lynch	922
7	Judith Halberstam, Female Masculinity	935

Part Ten Ethnic Literary and Cultural Studies, Critical Race Theory

1	Introduction: Julie Rivkin and Michael Ryan, Situating Race	959
2	Ian F. Haney Lopez, The Social Construction of Race	964
3	Shelley Fisher Fishkin, Interrogating "Whiteness"	975
4	Henry Louis Gates, The Blackness of Blackness: A Critique of the Sign and the Signifying Monkey	987
5	Toni Morrison, Playing in the Dark	1005
6	Gloria Anzaldúa, Borderlands/La Frontera	1017
7	Lisa Lowe, Heterogeneity, Hybridity, Multiplicity: Marking Asian American Differences	1031

8 Robert Dale Parker, Tradition, Invention, and Aesthetics in Native American Literature	1051
---	------

Part Eleven Colonial, Post-colonial, and Transnational Studies

1 Introduction: Julie Rivkin and Michael Ryan, English Without Shadows: Literature on a World Scale	1071
2 Dennis Walder, History	1075
3 C. C. Eldridge, The Revival of the Imperial Spirit	1090
4 Ania Loomba, Situating Colonial and Postcolonial Studies	1100
5 Edward Said, Jane Austen and Empire	1112
6 Ngugi wa Thiong'o, Decolonising the Mind	1126
7 Edward Kamau Brathwaite, English in the Caribbean	1151
8 Homi K. Bhabha, Signs Taken for Wonders	1167
9 Anne McClintock, The Angel of Progress: Pitfalls of the Term "Post-colonialism"	1185
10 Chidi Okonkwo, Casualties of Freedom	1197
11 Alan Lawson, The Anxious Proximities of Settler (Post)colonial Relations	1210
12 Jamaica Kincaid, A Small Place	1224

Part Twelve Cultural Studies

1 Introduction: Julie Rivkin and Michael Ryan, The Politics of Culture	1233
2 Walter Benjamin, The Work of Art in the Age of Mechanical Reproduction	1235
3 Max Horkheimer and Theodor Adorno, The Culture Industry as Mass Deception	1242
4 Michel de Certeau, The Practice of Everyday Life	1247
5 Dick Hebdige, Subculture: The Meaning of Style	1258
6 John Fiske, Culture, Ideology, Interpellation	1268
7 John Fiske, Television Culture	1274
8 Adam Krims, Rap Music and the Poetics of Identity	1285
Index	1311

Preface

This book began, as one might guess, in the classroom. We have been teaching courses in contemporary literary theory for the past two decades, and we have each had the familiar experience of not being able to match the design of our courses to any anthology currently available. The move from awkwardly assembled xerox packets to an actual anthology has been both a natural outgrowth of our teaching and an astonishingly complex process of research, selection, and projection. For although the germ of the book was our own classroom(s), its destination has always been many classrooms, courses no doubt much different than any we ourselves might teach, and yet ones that our selections would ideally work both to accommodate and to enrich.

The scale of the volume is one expression of its projected flexibility; we felt that an anthology of literary theory needed not only to cover the range of theoretical perspectives or approaches that characterize the era "after the New Criticism," the era that we take to be that of contemporary literary theory, but also to represent those perspectives with reasonable depth and range. The effect of such a decision, we hope, is that many kinds of courses will find a home in these selections, that a course that takes as its focus Structuralism, Post-structuralism, Post-colonialism, or Psychoanalysis and Gender Studies will find this anthology as useful as one that makes a more extensive survey of theoretical perspectives.

The anthology opens with formalisms - both Russian and American - in a gesture that marks its organization as partly chronological and partly heuristic. That is, we take formalism - at least in its American avatar of New Criticism - to mark the condition of students' theoretical awareness before beginning the journey into "theory." To the degree that they have been taught a form of "close reading" as the basic task of literary analysis, they are practicing formalists, though the practice may be, like that of the prose-speaking M. Jourdain in Moliere's *Bourgeois Gentilhomme*, an unself-conscious one. Exploring the theoretical premises of a New Critical practice, placing those in conjunction with a historically unrelated yet theoretically cognate predecessor, Russian Formalism, seems like an appropriate way to initiate an exposure to "theory" in its less familiar guises.

The parts themselves have undergone many evolutions; the issue of where to draw the lines, what denomination to use, and where to locate certain selections has been as theoretically complex as it has been practically consequential. While "Deconstruction," for example, enjoyed a separate life in literary critical history in the US in the 1970s and 1980s, we felt it more appropriate to place it within its historical and intellectual French context, and so you will find Derrida amongst Deleuze and Guattari, and Baudrillard under "Post-structuralism, Deconstruction,

and Post-modernism." The question of how to categorize some of the more recent kinds of theory, regarding gender and post-coloniality especially, was also difficult, and we opted for big tents in both instances: "Gender Studies," "Ethnic Literary and Cultural Studies," and "Post-colonial and Trans-national Studies." A separate section could easily have been devoted to any of these theoretical projects, each of which has already produced its own "classic" texts, and while attending to these developments has been one goal of the anthology, we wished as well to embrace both the heterodox and the newly canonical. Some of the names in our table of contents may not be readily recognizable for this reason, and our inclusion of these texts is less a sign of presumption regarding future canonicity than it is an indicator of our desire to locate the anthology as much in the contemporary realm as possible. That has meant guessing, and we based our guesses on what we felt would be exciting or helpful in the classroom.

In a desire both to be as inclusive as possible and to represent works not commonly anthologized, we have done a certain amount of excerpting. Our principle has been to represent the core of a given work, and if, to that end, we have sacrificed portions of texts that readers will deem necessary, we can only suggest that our selections constitute a useful beginning to a more extensive acquaintance. We apologize in advance for any such textual editing deemed brutal.

One anomaly of this anthology - though we feel a motivated one - comes in the form of introductions to the parts. Recognizing the pedagogical importance of introductions, we initially selected works that could serve this purpose from the wide range of what has been published. But in certain cases, we found that no one framed the theoretical project in quite the way that our own selections required, and thus found it necessary to write out, in a sense, the logic of our own selection. Thus, while our initial plan was always to let the editorial task be one of selection, to let the theorists speak for themselves, we found that in certain cases our work of selection would not be well served unless accompanied by an appropriate introduction. In some cases we were able to perform this task with relative brevity; in other cases we found a longer exposition required. So although the parts are variously introduced, our hope is that in each case the job is done in such a way that the selections that follow make sense to students encountering the material for the first time.

In making an anthology of this kind, one cannot help but be aware of one's location in the "canon wars," those struggles in recent years over who or what shall be taught in general literature or cultural history courses on the undergraduate level. To the degree that it at all self-consciously engages with those debates, this book is an effort to bring together from a variety of heterogeneous origins some of the literary theories that have helped inspire those debates, in as much as they are about new methods of literary, cultural, and social analysis.

A final word about our cover illustration. The words "No Radio" refer to a sign people put in their cars in New York City. It means "don't bother breaking into the body of this car; the radio has already been either stolen or else removed by the owner." We asked Blackwell to use this image because it speaks to the reservations many still feel about "theory" and about its association with the ideology of mastery through critical analysis that murders to dissect. It also speaks, of course, to our hesitations as editors engaged in the compilation and dissemination of such theories. We would not summon the image (and we would not engage in the work) if we did not feel that "theory" is itself filled with doubt regarding the objectivist ideal the

image so carefully mocks. Some theories do indeed fulfill the aspirations of the man with the heart in his hand, but we hope you will feel that there are many others in this book that adopt the perspective of the woman on the table.

Preface to the Second Edition

This second edition of *Literary Theory: An Anthology* records in its arrangement changes that have occurred since we did the first edition. Post-Colonial Studies has emerged as a distinct enough area from Ethnic Studies to merit a section of its own. And Ethnic Studies has been deepened and broadened by the emergence of new scholarly voices in Native American, Asian American, and Hispanic American literary studies. We have added a new section entitled "Rhetoric, Phenomenology, Reader Response" to make up for an absence in the first edition. We have also extended the reach of the sections on Psychoanalysis, History, Structuralism, Marxism, and Cultural Studies by including new selections. Our aim, as in the first edition, has been to combine a sense of the intellectual background of a critical or theoretical approach with a representative sampling of voices in the contemporary critical scene. We have designed this edition to be used on its own, but it can also be used in tandem with *Literary Theory: A Practical Introduction*, which conducts readings of a small selection of literary works from the theoretical perspectives represented in this anthology.

Acknowledgments

We have occasionally modified translations.

Without Asha Nadkarny and Chi Chan, this book would not exist. We thank them, and we thank all the students in our introductory criticism courses over the years who helped shape our perceptions of what literary theory is and of what *Literary Theory* would have to be.

And thank you, Gabriel and Nathaniel, for being so patient.

The editors and publisher gratefully acknowledge the permission granted to reproduce the copyright material in this book:

Formalisms: Russian Formalism and New Criticism

Introduction: Formalisms

Julie Rivkin and Michael Ryan

It has become a commonplace of literary study that to study literature is to study language, yet prior to the formalist movements of the early twentieth century -Russian Formalism and American New Criticism - the study of literature was concerned with everything about literature except language, from the historical context of a literary work to the biography of its author. How literary language worked was of less importance than what a literary work was about. Two movements in early twentieth-century thought helped move literary study away from this orientation. The first movement was the attempt on the part of philosophers of science like Edmund Husserl to isolate objects of knowledge in their unmixed purity. The Russian Formalists, a group of young scholars (Viktor Shklovsky, Roman Jakobson, Boris Tomashevsky, Boris Eichenbaum) who wrote in the teens and twenties, were influenced by this approach. For them, literature would be considered not as a window on the world but as something with specifically literary characteristics that make it literature as opposed to philosophy or sociology or biography. Literature is not a window for looking at sociological themes or philosophic ideas or biographical information; rather, it is a mural or wall painting, something with a palpability of its own which arrests the eye and merits study. The manipulation of representational devices may create a semblance of reality and allow one to have the impression of gazing through glass, but it is the devices alone that produce that impression, and they alone are what makes literature literary.

The second movement was the attempt on the part of idealist philosophers like Benedetto Croce to develop a new aesthetics, or philosophy of art, which would rebut the claim of science that all truth is grounded in empirical facts knowable through scientific methods. Art provides access to a different kind of truth than is available to science, a truth that is immune to scientific investigation because it is accessible only through connotative language (allusion, metaphor, symbolism, etc.) and cannot be rendered in the direct, denotative, fact-naming language of the sciences. The American New Critics (Cleanth Brooks, William K. Wimsatt, John Crowe Ransom, Allen Tate) were influenced by the new aesthetic philosophies. For them, literature should be studied for the way literary language differs from ordinary practical language and for the unique truths conveyed only through such literary language.

The Russian Formalists were interested both in describing the general characteristics of literary language and in analyzing the specific devices or modes of operation of such language. Perhaps their most famous general claim is that literary language consists of an act of defamiliarization, by which they mean that such literature

presents objects or experiences from such an unusual perspective or in such unconventional and self-conscious language that our habitual, ordinary, rote perceptions of those things are disturbed. We are forced to see things that had become automatic and overly familiar in new ways. Shklovsky cites the example of Tolstoy, who presents a meditation on property from the point of view of a horse, or who recounts the story of a flogging in such a blank manner that the then accepted practice seems strange and novel to the otherwise inured reader.

More specifically, the Formalists were interested in analyzing literature into its component parts and in describing its principal devices and modes of operation. This analysis took two main forms in the two major genres of prose narrative and poetry, concentrating in the first on the operations of narrative and in the second on sound in verse. The Formalists noticed that narrative literature consisted of two major components: the plot, by which they meant the story as narrated within the pages of the book (with all the attendant arrangements of chronological sequence, point of view, etc.), and the story, by which they meant the sequence of events in the order and the actual duration in which they ostensibly occurred. Once this simple distinction is made, one can begin to analyze all of the features of story-telling, the many devices such as point of view, delayed disclosure, narrative voice, and the like that go into the creation of the imaginary story through the manipulation of plot or story-telling devices. One can, for example, begin to study a novel like *The Scarlet Letter* for its narrative strategies instead of for the ways in which it depicts Puritanism.

In the analysis of poetry, the Formalist focus was on the qualities of poetic language that distinguish it from ordinary practical language, the distinction between the literary and the non-literary being more pronounced in this genre. Whereas ordinary language must subordinate its rules of operation (grammar) to the practical goal of communicating information, poetic language is distinguished by the foregrounding of such devices or motifs as euphony, rhythm, alliteration, consonance, repetition, and rhyme which obey a very different logic from that required to communicate information. A meteorologist might say that "precipitation in the Iberian peninsula is concentrated in the central plateau," and in light of that practical use of language, the internal rhyming of "the rain in Spain falls mainly on the plain" will seem impractical and unnecessary, but it is such devices that make poetry a distinct linguistic undertaking, a mode of language use with autonomous rules of operation which, unlike grammar, are not subordinated to a practical function. While practical speech facilitates access to information by making language as transparent as possible, poetic speech contorts and roughens up ordinary language and submits it to what Roman Jakobson called "organized violence," and it is this roughening up of ordinary language into tortuous "formed speech" that makes poetry poetry rather than a weather report.

While literature for the Formalists is characterized by invariant patterns, recurring devices, and law-like relations, it also changes over time and varies from one historical epoch to another. The Formalists account for such change in two ways. They claim that literary evolution is the result of the constant attempt to disrupt existing literary conventions and to generate new ones. And they argue that literary change is the result of the autonomous evolution of literary devices.

A more traditional concept of the content/form distinction might lead one to conclude that literature changes when the world changes because literature merely

gives form to ideas and realities that lie outside the literary realm and constitute its cause or motivation. But for the Formalists, literary devices owe no debt to such motivations; they evolve autonomously of them and are motivated entirely by literary origins. For literature to be literature, it must constantly defamiliarize the familiar, constantly evolve new procedures for story-telling or poetry-making. And such change is entirely autonomous of the social and historical world from which the materials of literature are taken. Cervantes' satiric novel *Don Quixote*, for example, makes fun of the popular romantic novels about knights and quests which constituted the dominant form of story-telling in his day. It emerged not because of changes in the world or in Cervantes' life but rather as a result of a specifically literary evolution. The new device of the problematic hero was made possible and necessary by the development of the novel form itself.

You will find a major Russian Formalist, Roman Jakobson, placed under Structuralism in this anthology because there is a strong historical as well as methodological link between the two intellectual movements. Many of the original Formalists were linguists, with Jakobson being the most influential. He left Russia in 1920 and traveled to Czechoslovakia, where he was part of the linguistic circles that inspired French Structuralism in the 1940s and 1950s. The Structuralists, whose work was particularly influential in France through the 1960s, share a methodological interest with Formalist linguistics in that they saw culture in general as constituted by the same rules of operation that one finds in language. Although the Russian Formalists were suppressed by the Stalinist government in Russia in the 1920s, news of their work was borne West by East European emigres such as Rene Wellek, Julia Kristeva, and Tzvetan Todorov, where it helped shape French Structuralism as well as such literary critical schools as poetics, stylistics, and narratology.

The impulse toward formal analysis was not limited in Russia to the group of thinkers usually clustered under the rubric Russian Formalists. Vladimir Propp was a scholar of folktales who wrote at the same time as the Formalists and who analyzed the component features of folktale narratives. A wide range of tales could be shown to share the same sequence of narrative motifs, from "the hero leaves home" to "the hero receives a magic token" to "the hero is tested in battle." The work of Mikhail Bakhtin, while it is historically at odds with the Formalists in its emphasis on the social and ideological features of literature, shares their concern with describing those formal elements that make a literary genre such as the novel distinct from other literary forms. His work also represents an expansion of the original Formalist undertaking to include not only genres but also extra-literary uses of language such as that of the carnival, which Bakhtin saw influencing the work of certain writers such as Francois Rabelais.

While the Russian Formalist movement was scientific and rational, the other major formalist school - American New Criticism - was anti-scientific and interested in the nonrational dimension of art. Both critical movements nevertheless shared an interest in what it is about literary language that makes it different from the ordinary use of language, and both considered the proper object of literary study to be literary texts and how they worked rather than authors' lives or the social and historical worlds to which literature refers. Two well-known terms that are part of a New Critical legacy - the intentional fallacy and the affective fallacy - name this act of delimiting the object of literary study and separating it from biography or sociology. According to the intentional fallacy, meaning resides in the verbal design of a literary work, not in

statements regarding his or her intention that the author might make. According to the affective fallacy, the subjective effects or emotional reactions a work provokes in readers are irrelevant to the study of the verbal object itself, since its objective structure alone contains the meaning of the work.

While the Russian Formalists were concerned with elucidating the modes of operation of entire genres such as the novel, the New Critics concentrated their energies on individual literary works, especially poems. "Close reading" is the term most often used to describe their method. The purpose of such close reading was not, however, the analysis of literary devices or motifs considered as an end in itself. It was instead the elucidation of the way literature embodies or concretely enacts universal truth, what the New Critics called "concrete universals."

Poetry, they argued, differs from ordinary practical speech, which uses language denotatively (one word for one thing), in that poetry uses language connotatively or in a way that evokes secondary meanings. Such language use allows poetry to be both concrete and specific as well as universal and general. An urn can be both an ordinary object *and* a metaphor for the eternal durability of art. Poetic language thus reconciles the ordinarily opposed elements of the concrete and the universal, the specific word and general meaning, body and spirit. Such reconciliation is possible in connotative poetic tropes such as paradox, irony, and metaphor, tropes which either join ordinary objects to universal meanings (metaphor, symbol) or reconcile seemingly opposed elements (irony, paradox). Cleanth Brooks, for example, notices in a famous close reading that Keats' poem "Ode on a Grecian Urn" is full of paradoxes such as "Cold pastoral" and "unheard melodies" which imply both life and death at once, the paradoxical cohabitation of what is vivid and moving with what is frozen and still. This is so, Brooks argues, because the poem is about how art, figured in the urn, is more vivid than life itself, even though it seems lifeless. Although dead, it possesses eternal life.

The practical denotative language of science cannot name such truth because such language is limited to the naming of positive empirical facts that can be grasped by the senses. The realm of universal meaning, however, is beyond sensory experience and cannot be analyzed using scientific methods. It can only be alluded to indirectly in poetic language and cannot be paraphrased in literal, denotative speech. For the American New Critics, therefore, the description of literary devices such as metaphor, irony, and paradox was inseparable from a theory of universal meaning that was a polemical response to modern positivist science. While the Russian Formalists sought a value-free mode of critical description, one that would scientifically specify what it is about literature that is literary, the New Critics informed the study of literature with a concern for traditional religious and aesthetic values of a kind being displaced by science, in this case, the values of Christian theology and idealist aesthetics (that is, an aesthetics rooted in the idea that universal truth is available through art of a kind that is not determined by material social and historical circumstances). Those values have receded in importance with time, and the legacy of the New Criticism that has remained most abiding is the concern with the close reading of texts and with the analysis of the operation of literary language in all its complexity.

The Formal Method

Boris Eichenbaum

In this recapitulation of the early work of the Russian Formalist critics, first published in 1926, Eichenbaum, an original member of the Society for the Study of Poetic Language (or *Opoyaz*), which was founded in 1916, sums up the group's major achievements. Polemicizing against the Symbolists, who believed literary form was the clothing of spiritual meaning, the formal critics countered that the primary motivating factor in literature is form itself, the techniques and devices an artist uses.

The organization of the Formal method was governed by the principle that the study of literature should be made specific and concrete ...

[The Formalists'] basic point was, and still is, that the object of literary science, as literary science, ought to be the investigation of the specific properties of literary material, of the properties that distinguish such material from material of any other kind, notwithstanding the fact that its secondary and oblique features make that material properly and legitimately exploitable, as auxiliary material, by other disciplines. The point was consummately formulated by Roman Jakobson:

The object of study in literary science is not literature but "literariness," that is, what makes a given work a literary work. Meanwhile, the situation has been that historians of literature act like nothing so much as policemen, who, out to arrest a certain culprit, take into custody (just in case) everything and everyone they find at the scene as well as any passers-by for good measure. The historians of literature have helped themselves to everything - environment, psychology, politics, philosophy. Instead of a science of literature they have worked up a concoction of homemade disciplines. They seem to have forgotten that those subjects pertain to their own fields of study - to the history of philosophy, the history of culture, psychology, and so on, and that those fields of study certainly may utilize literary monuments as documents of a defective and second-class variety among other materials.

To establish this principle of specificity without resorting to speculative aesthetics required the juxtaposing of the literary order of facts with another such order. For this purpose one order had to be selected from among existent orders, which, while contiguous with the literary order, would contrast with it in terms of functions. It was just such a methodological procedure that produced the opposition between "poetic" language and "practical" language. This opposition was set forth in the first *Opoyaz* publications (L. Jakubinskij articles), and it served as the activating principle for the Formalists' treatment of the fundamental problems of poetics. Thus, instead of an orientation toward a history of culture or of social life, toward psychology, or

aesthetics, and so on, as had been customary for literary scholars, the Formalists came up with their own characteristic orientation toward linguistics, a discipline contiguous with poetics in regard to the material under investigation, but one approaching that material from a different angle and with different kinds of problems to solve. ...

The comparison of poetic language with practical language was made in general terms by Lev Jakubinskij in his first article, "On Sounds in Verse Language." The formulation of the difference between the two language systems ran as follows:

The phenomena of language ought to be classified according to the purpose for which the speaker uses his language resources in any given instance. If the speaker uses them for the purely practical purpose of communication, then we are dealing with the system of *practical language* (discursive thought), in which language resources (sounds, morphological segments, and so forth) have no autonomous value and are merely a *means* of communication. But it is possible to conceive and in fact to find language systems in which the practical aim retreats to the background (it does not necessarily disappear altogether), and language resources acquire autonomous value.

It was important to establish this difference as a foundation for building a poetics.

The natural conclusion from all these observations and principles was that poetic language is not just a language of "images," and that sounds in verse are not at all mere elements of external euphony serving only to "accompany" meaning, but that they do have autonomous value. The stage was set for a reexamination of Potebnja's general theory with its basic assertion that poetry is "thinking in images." This conception, which was the one accepted by the theorists of Symbolism, made it requisite to regard the sounds of verse as the "expression" of something standing behind a poem and to interpret them either as onomatopoeia or as "painting with sounds." Andrej Belyj's studies are especially illustrative of this. Belyj found in two lines of Pushkin the complete "picture in sounds" of champagne being poured from a bottle into a glass and in Blok's repetition of cluster *rdt* the "tragedy of turning sober."³ Such attempts, verging on parody, to "explain" alliterations were bound to provoke on our part energetic opposition in terms of basic theory and our endeavors to demonstrate concretely that sounds in verse exist outside any connection with imagery and have an independent speech function.

L. Jakubinskij's articles linguistically substantiated the autonomous value of sounds in verse. Osip Brik's article "Sound Repetitions" brought actual material to the fore (excerpts from Pushkin and Lermontov) and arranged it in various typological classes. After disputing the popular notion of poetic language as the language of "images," Brik came to the following conclusion:

However the interrelationship of sound and image may be regarded, one thing is certain: sounds and sound harmonies are not merely a euphonic extra but are the result of an autonomous poetic endeavor. The orchestration of poetic speech is not fully accounted for by a repertoire of overt euphonic devices, but represents in its entirety the complex production of the interaction of the general laws of euphony. Rhythm, alliteration, and so forth are only the obvious manifestation of particular instances of basic euphonic laws.

In contrast to Belyj's works, Brik's article contained no interpretations of what particular cases of alliteration were supposed to mean; the article limited itself to the

supposition that repetition in verse is analogous to tautology in folklore, that is, that repetition in these instances plays some aesthetic role in its own right. "It is likely that we are dealing here with various manifestations of the same general poetic principle'- the principle of simple combination, the material being either the sounds of the words, or their meaning, or both." This sort of predication of one device applied to a wide range of material was very characteristic of the early period of the Formalists' work ____

The Formalists simultaneously freed themselves from the traditional correlation of "form-content" and from the conception of form as an outer cover or as a vessel into which a liquid (the content) is poured. The facts testified that the specificity of art is expressed not in the elements that go to make up a work but in *the special way they are used*. By the same token, the concept of "form" took on a different meaning; it no longer had to be paired with any other concept, it no longer needed correlation.

In 1914, before the *Opojaz* alliance and during the days of the Futurists' public demonstrations, Sklovskij published a pamphlet, *The Resurrection of the Word*.⁵ Relying in part on Potebnja and Veselovskij (the question of imagery had then not yet acquired crucial meaning), he advanced the principle of the palpableness (*oscutimost*) of form as the specific criterion of perception in art:

We do not experience the familiar, we do not see it, we recognize it. We do not see the walls of our rooms. We find it very difficult to catch mistakes when reading proof (especially if it is in a language we are very used to), the reason being that we cannot force ourselves to see, to read, and not just "recognize," a familiar word. If it is a definition of "poetic" perception or of "artistic" perception in general we are after, then we must surely hit upon this definition: "artistic" perception is a perception that entails awareness of form (perhaps not only form, but invariably form).

It should be evident that *perception* figures here not as a simple psychological concept (the perception of the individual human beings) but as an element of art in itself, since it is impossible for art to exist without being perceived. A concept of form in a new meaning had now come into play - not just the outer covering but the whole entity, something concrete and dynamic, substantive in itself, and unqualified by any correlation. This signaled a decisive departure from the principles of Symbolism, which had held that something already "substantive" was supposed to emanate "through form." It also meant that "aestheticism" - a delectation with certain elements of form consciously divorced from "content" - had likewise been overcome.

This, however, did not yet constitute an adequate basis for concrete work: To supplement the points established by the recognition of a difference between poetic language and practical language and by the recognition that the specificity of art is expressed in a special usage of material, the principle of the palpableness of form had to be made concrete enough to foster the analysis of form itself- form understood as content. It had to be shown that the palpableness of form results from special artistic procedures acting on perceivers so as to force them to experience form. Sklovskij's "Art as Procedure,"⁷ a kind of manifesto of the Formal method, set the stage for the concrete analysis of form. Here the removal from Potebnja and Potebnjaism and by the same token from the principles of Symbolism was made perfectly explicit. The article opens with objections to Potebnja's basic stand on imagery and on the relationship of the image with what it is meant to explain. Sklovskij points out among other things that images are almost always static.

The more light you shed on a literary period, the more you become convinced that the images you had considered to be the creation of a certain particular poet had been borrowed by him from other poets, virtually unchanged. All that the work of poetic schools amounts to is the acquisition and demonstration of new procedures for deploying and elaborating verbal materials; in particular, it amounts much more to deploying images than creating them. Images are handed down; and poetry involves far more reminiscence of images than thinking in them. In any case, imagistic thinking is not that factor whose change constitutes the essence of the momentum of poetry.

Further on, the difference between the poetic and the prosaic image is pointed out. The poetic image is defined as one of the means of poetic language - a procedure equal in the task it fulfills to other procedures of poetic language: parallelism (simple and negative), comparison, repetition, symmetry, hyperbole, etc. The concept of the image was relegated to a position within the general system of poetic procedures, and so it had lost its overriding importance for theory. Concomitantly, the principle of artistic economy, a principle deeply embedded in the theory of art, had been refuted. Sklovskij countered by advancing the procedure of "making it strange" (*ostranenie*) and the procedure of impeded form, "which augments the difficulty and the duration of perception, since the process of perception in art is an end in itself and is supposed to be prolonged." Art is conceived as a way of breaking down automatism in perception, and the aim of the image is held to be, not making a meaning more accessible for our comprehension, but bringing about a special perception of a thing, bringing about the "seeing," and not just the "recognizing," of it. Hence the usual connection between the image and the procedure of "making strange."

The break with Potebnjaism was definitely formulated in Sklovskij's "Potebnja."⁸ He repeats once again that the use of images and symbols does not constitute the distinguishing feature of poetic language as against prosaic (practical) language.

Poetic language is distinguished from prosaic language by the palpableness of its construction. The palpableness may be brought about by the acoustical aspect or the articulatory aspect or the semiological aspect. Sometimes what is palpable is not the structure of the words but the use of words in a construction, their arrangement. One of the means of creating a palpable construction, the very fabric of which is experienced, is the poetic image, but it is only one of the means... If scientific poetics is to be brought about, it must start with the factual assertion, founded on massive evidence, that there are such things as "poetic" and "prosaic" languages, each with their different laws, and it must proceed from an analysis of those differences.

These articles may be considered the summation of the initial period in the Formalists' work. The main accomplishment of that period consisted in establishing a number of theoretical principles to serve as working hypotheses for a further concrete investigation of facts; it also surmounted popularly held theories derived from Potebnjaism. As is evident from the articles cited, the basic efforts of the Formalists were directed neither toward the study of so-called "form" nor toward the construction of a special "method," but toward substantiating the claim that verbal art must be studied in its specific features, that it is essential for that purpose to take the different functions of poetic and practical languages as the starting point. As for "form," all that concerned the Formalists was to shift the meaning of that badly confused term in such a way as to obviate its persistent association with the concept of "content," a term even more badly confused than form and totally unscientific. It

was important to do away with the traditional correlation and by so doing to enrich the concept of form with new meanings. As matters further evolved, it was the concept of "procedure" that had a far greater significance, because it stemmed directly from the recognition of the difference between poetic and practical languages.

Before I turn to the Formalists' endeavors in literary history, I want to bring to a conclusion my survey of the theoretical principles and problems contained in the *Opo-jaz* works of the earliest period. In that article by Sklovskij already discussed, there is another concept that played a major role in the subsequent study of the novel: the concept of "motivation" (*motivirovka*). The determination of various procedures of plot formation (serial construction, parallelism, framing, concatenation, and others) established the distinction between the elements of a work's construction and the elements comprising the material it uses (the story stuff, the choice of motifs, of protagonists, of themes, etc.). This distinction was then stressed especially heavily, because the main task was to establish the unity of any chosen structural procedure within the greatest possible diversity of material. Older scholarship had operated exclusively with material conceived as the "content" and had relegated everything else to "outer form," which it regarded as a matter of interest only to fanciers of form, or even as a matter of no interest at all. That is the derivation of the naive and touching "aestheticisms" by which our older critics and historians of literature discovered the "neglect of form" in Tjutcov's poetry and simply "poor form" in writers like Nekrasov or Dostoevskij.

What saved the situation was the fact that form was forgiven these writers out of deference to the profundity of their ideas or attitudes. It was only natural that the Formalists, during their years of struggle and polemics against traditions of that sort, should have directed all their efforts toward promoting the significance of structural procedures and subordinating everything else as *motivation*.

The concept of motivation enabled the Formalists to approach literary works (in particular, novels and short stories) at even closer range and to observe the details of their construction. And that is just what Sklovskij did in his next two studies, *Plot Unfolding* and *Sterne's Tristram Shandy and the Theory of the Novel*. In both of these works he scrutinized the relationship between procedure and motivation, using Cervantes's *Don Quixote* and Sterne's *Tristram Shandy* as material for a study of the construction of story and novel outside the context of literary historical problems. *Don Quixote* is viewed as a point of transition from story collections (like the *Decameron*) to the single-hero novel, structured on the procedure of concatenation, with a journey serving as motivation.

That *Don Quixote* was the novel singled out for special attention had to do with the fact that procedure and motivation are not so integrated in it as to produce a fully motivated novel with all parts fused together. The material is often merely interpolated and not infused; the procedures of plot formation and the techniques of manipulating material to further the plot stand out sharply, whereas the later development of novel construction goes "the way of ever more tightly wedging fragments of material into the very body of the novel." In the course of analyzing "how *Don Quixote* is made," Sklovskij, among other things, points out the hero's pliability and infers that this very "type" of hero came about "under the impact of devising the construction of the novel." Thus, the predominance of the construction, of the plot over material, was stressed.

The most suitable material for illustrating theoretical problems of this sort is, understandably enough, art which is not fully motivated or which deliberately tears

away motivation and bares its construction. The very existence of works with an intentionally bared construction necessarily stands these problems in good stead as confirmation of the importance of their treatment and the real fact of their pertinence. Moreover, it is precisely the light shed by these problems and principles that elucidates the works themselves. And that was exactly the case with Sterne's *Tristram Shandy*. Thanks to Sklovskij's study, this novel not only contributed illustrations for theoretical postulations but also acquired a new meaning of its own so that it attracted fresh attention. Against the background of a new-found interest in its construction, Sterne's novel became a piece of contemporary writing, and Sterne became a topic of discussion for people who, until then, had seen nothing in his novel except tedious chatter or curios, or who had viewed it from the angle of its much-made-of "sentimentalism," a "sentimentalism" for which Sterne was as little responsible as Gogol was for "realism."

Observing in Sterne a deliberate baring of constructional procedures, Sklovskij argues that the very design of construction is emphasized in Sterne's novel: Sterne's awareness of form, brought out by way of his violation of form, is what in fact constitutes the content of the novel. At the end of his study, Sklovskij formulates the distinction between plot (*sjuzet*) and story-stuff (*fabula*):

The concept of *plot* is too often confused with the depiction of events - with what I tentatively propose terming "story-stuff." The story-stuff actually is only material for filling in the plot. Therefore, the plot of *Evgenij Onegin* is not the hero's romance with Tat'jana but the plot-processing of this story-stuff worked out by introducing intermittent digressions The forms of art are to be explained by their artistic immanence, not by real-life motivation. When an artist holds back the action of a novel, not by employing intruders, for example, but simply by transposing the order of the parts, he makes us aware of the aesthetic laws underlying both procedures of composition.

It was in connection with the construction of the short story that my article "How Gogol's 'Overcoat' Is Made"¹⁰ was written. The article couples the problem of plot with the problem of *skaz*, that is, the problem of a construction based on a narrator's manner of narrating. I tried to show that Gogol's text "is composed of animated locutions and verbalized emotions," that "words and sentences were chosen and linked together in Gogol on the principle of expressive *skaz*, in which a special role belongs to articulation, miming, sound gestures, etc." From that point of view the composition of *The Overcoat* proved on analysis to be built on a successive alternation of comic *skaz* (with its anecdotes, play on words, etc.) and sentimental-melodramatic declamation, thus imparting to the story the character of a grotesque. In this connection, the ending of *The Overcoat* was interpreted as an apotheosis of the grotesque - something like the mute scene in *The Inspector General*. Traditional arguments about Gogol's "romanticism" or "realism" proved to be unnecessary and irrelevant.

The problem of the study of prose fiction was therefore moved off dead center. A distinction had been established between the concept of plot, as that of construction, and the concept of story-stuff, as that of material; the typical procedures of plot formation had been clarified thanks to which the stage was now set for work on the history and theory of the novel; concomitantly, *skaz* had been advanced as the constructional principle of the plotless story. These studies exercised an influence detectable in a whole series of investigations produced in later years by persons not directly connected with *Opojaz* ...

Things were somewhat different in the case of poetry. Vast numbers of works by Western and Russian theorists, the Symbolists' practical and theoretical experiments, debates over the concepts of rhythm and meter, and the whole corpus of specialized literature to which those debates gave rise between 1910 and 1917, and finally, the appearance of the Futurists' new verse forms - all this did not so much facilitate as complicate the study of verse and even the formulation of the problems involved. Instead of addressing themselves to the basic issues, many investigators devoted their efforts to special problems in metrics or to the task of sorting out the systems and views already amassed. Meanwhile, no theory of verse, in the broad sense of the word, was to be had; there was no theoretical illumination of the problem of verse rhythm or of the connection between rhythm and syntax or of sounds in verse (the Formalists had only identified a certain linguistic groundwork), or of verse vocabulary and semantics, and so on. In other words, the problem of verse, as such, remained essentially up in the air. An approach was needed which would steer away from particular problems of metrics and would engage verse from some more fundamental point of view. What was needed, first of all, was a restatement of the problem of rhythm in such a way that the problem would not hinge on metrics and would encompass the more substantive aspects of verse language ...

The start was made by Osip Brik's "On Rhythmic-Syntactic Figures."¹¹ Brik's report demonstrated the actual existence in verse of constant syntactic formations inseparably bound with rhythm. Therefore the concept of rhythm relinquished its abstract character and touched on the very fabric of verse - *the phrase unit*. Metrics retreated to the background, retaining a significance as the rudiments, the alphabet, of verse. This step was as important for the study of verse as the coupling of plot with construction had been for the study of prose fiction. The discovery of rhythmic-syntactic figures conclusively discredited the notion that rhythm is an external increment, something confined to the surface of speech. The theory of verse was led down a line of inquiry which treated rhythm as the structural base from which all elements of verse - nonacoustical as well as acoustical - derived definition _____

According to Tomatsevskij,

Verse speech is speech *organized* in its sound aspect. But inasmuch as sound aspect is a complex phenomenon, only some one particular element of sound is canonized. Thus in classical metrics the canonized element is the word stress, which classical metrics proceeded to subject to codification as a norm under its rules... But once the authority of traditional forms is even slightly shaken, the compelling thought arises that these primary features do not exhaust the nature of verse, that verse is viable also in its secondary features of sound, that there is such a thing as a recognizable rhythm along with meter, that verse can be written with only its secondary features observed, that *speech can sound like verse even without its observing a meter*.

The importance of "rhythmic impulse," a concept which had already figured in Brik's work, is affirmed by Tomatsevskij as the general rhythmic operational mode:

Rhythmic procedures can participate in various degrees in the creation of a rhythmic impression of artistic value: in individual works some one procedure or another may predominate; some one procedure or another may be the *dominant*. Focus on one rhythmic procedure or another determines the character of the work's concrete rhythm, and, with this in mind, verse may be classified as tonic-metrical verse (e.g., the

description of the battle in *Poltava*), intonational-melodic verse (Zukovskij's poetry), and harmonic verse (typical of Russian Symbolism in its later years).

Verse form, so understood, is not in opposition to any "content" extrinsic to it; it is not forced to fit inside this "form" but is conceived of as the genuine content of verse speech. Thus the very concept of form, as in our previous works, emerges with a new sense of sufficiency.

Art as Technique

Viktor Shklovsky

One of the founders of the Formalist study group in Petrograd in the early twentieth century, Shklovsky was also one of its most innovative thinkers. In seeking to move literary study out of the realm of religion and into that of science, Shklovsky and his colleagues argued against the Symbolists who conceived of poetry in spiritualist terms. In continuing the effort to exactly delineate the "literary" quality of those devices and techniques that separates them from ordinary prose, Shklovsky argues in this essay (1916) that such devices impede normal perceptions. This essay demonstrates the similarity between the formal scholarly undertaking and the innovations in poetry that were occurring at the same time in Europe, such as Dada. Concerned with writing that would be brutally honest and shockingly new, these writers rejected traditional culture and traditional artistic forms that had for them become both boring and overly conventional. Shklovsky, thinking along similar lines, saw all poetry as producing a shock effect that disrupted habitual ways of seeing and thinking.

If we start to examine the general laws of perception, we see that as perception becomes habitual, it becomes automatic. Thus, for example, all of our habits retreat into the area of the unconsciously automatic; if one remembers the sensations of holding a pen or of speaking in a foreign language for the first time and compares that with his feeling at performing the action for the ten thousandth time, he will agree with us. Such habituation explains the principles by which, in ordinary speech, we leave phrases unfinished and words half expressed. In this process, ideally realized in algebra, things are replaced by symbols. Complete words are not expressed in rapid speech; their initial sounds are barely perceived. Alexander Pogodin offers the example of a boy considering the sentence "The Swiss mountains are beautiful" in the form of a series of letters: *T, S, m, a, b.*

This characteristic of thought not only suggests the method of algebra, but even prompts the choice of symbols (letters, especially initial letters). By this "algebraic" method of thought we apprehend objects only as shapes with imprecise extensions; we do not see them in their entirety but rather recognize them by their main characteristics. We see the object as though it were enveloped in a sack. We know what it is by its configuration, but we see only its silhouette. The object, perceived thus in the manner of prose perception, fades and does not leave even a first impression; ultimately even the essence of what it was is forgotten. Such perception explains why we fail to hear the prose word in its entirety (see Leo Jakubinsky's article) and, hence, why (along with other slips of the tongue) we fail to pronounce it. The process of "algebrization," the over-automatization of an object, permits the greatest economy of perceptive effort. Either objects are assigned only one proper feature - a number,

for example — or else they function as though by formula and do not even appear in cognition:

I was cleaning and, meandering about, approached the divan and couldn't remember whether or not I had dusted it. Since these movements are habitual and unconscious I could not remember and felt that it was impossible to remember - so that if I had dusted it and forgot — that is, had acted unconsciously, then it was the same as if I had not. If some conscious person had been watching, then the fact could be established. If, however, no one was looking, or looking on unconsciously, if the whole complex lives of many people go on unconsciously, then such lives are as if they had never been.³

And so life is reckoned as nothing. Habitualization devours work, clothes, furniture, one's wife, and the fear of war. "If the whole complex lives of many people go on unconsciously, then such lives are as if they had never been." And art exists that one may recover the sensation of life; it exists to make one feel things, to make the stone *stony*. The purpose of art is to impart the sensation of things as they are perceived and not as they are known. The technique of art is to make objects "unfamiliar," to make forms difficult, to increase the difficulty and length of perception because the process of perception is an aesthetic end in itself and must be prolonged. *Art is a way of experiencing the artfulness of an object: the object is not important...*

After we see an object several times, we begin to recognize it. The object is in front of us and we know about it, but we do not see it - hence we cannot say anything significant about it. Art removes objects from the automatism of perception in several ways. Here I want to illustrate a way used repeatedly by Leo Tolstoy, that writer who, for Merezhkovsky at least, seems to present things as if he himself saw them, saw them in their entirety, and did not alter them.

Tolstoy makes the familiar seem strange by not naming the familiar object. He describes an object as if he were seeing it for the first time, an event as if it were happening for the first time. In describing something he avoids the accepted names of its parts and instead names corresponding parts of other objects. For example, in "Shame" Tolstoy "defamiliarizes" the idea of flogging in this way: "to strip people who have broken the law, to hurl them to the floor, and to rap on their bottoms with switches," and, after a few lines, "to lash about on the naked buttocks." Then he remarks:

Just why precisely this stupid, savage means of causing pain and not any other - why not prick the shoulders or any part of the body with needles, squeeze the hands or the feet in a vise, or anything like that?

I apologize for this harsh example, but it is typical of Tolstoy's way of pricking the conscience. The familiar act of flogging is made unfamiliar both by the description and by the proposal to change its form without changing its nature. Tolstoy uses this technique of "defamiliarization" constantly. The narrator of "Kholstomer," for example, is a horse, and it is the horse's point of view (rather than a person's) that makes the content of the story seem unfamiliar. Here is how the horse regards the institution of private property:

I understood well what they said about whipping and Christianity. But then I was absolutely in the dark. What's the meaning of "his own," "his colt"? From these

phrases I saw that people thought there was some sort of connection between me and the stable. At the time I simply could not understand the connection. Only much later, when they separated me from the other horses, did I begin to understand. But even then I simply could not see what it meant when they called me "man's property." The words "my horse" referred to me, a living horse, and seemed as strange to me as the words "my land," "my air," "my water."

But the words made a strong impression on me. I thought about them constantly, and only after the most diverse experiences with people did I understand, finally, what they meant. They meant this: In life people are guided by words, not by deeds. It's not so much that they love the possibility of doing or not doing something as it is the possibility of speaking with words, agreed on among themselves, about various topics. Such are the words "my" and "mine," which they apply to different things, creatures, objects, and even to land, people, and horses. They agree that only one may say "mine" about this, that or the other thing. And the one who says "mine" about the greatest number of things is, according to the game which they've agreed to among themselves, the one they consider the most happy. I don't know the point of all this, but it's true. For a long time I tried to explain it to myself in terms of some kind of real gain, but I had to reject that explanation because it was wrong.

Many of those, for instance, who called me their own never rode on me - although others did. And so with those who fed me. Then again, the coachman, the veterinarians, and the outsiders in general treated me kindly, yet those who called me their own did not. In due time, having widened the scope of my observations, I satisfied myself that the notion "my," not only has relation to us horses, has no other basis than a narrow human instinct which is called a sense of or right to private property. A man says "this house is mine" and never lives in it; he only worries about its construction and upkeep. A merchant says "my shop," or "my dry goods shop," for instance, and does not even wear clothes made from the better cloth he keeps in his own shop.

There are people who call a tract of land their own, but they never set eyes on it and never take a stroll on it. There are people who call others their own, yet never see them. And the whole relationship between them is that the so-called "owners" treat the others unjustly.

There are people who call women their own, or their "wives," but their women live with other men. And people strive not for the good in life, but for goods they can call their own.

I am now convinced that this is the essential difference between people and ourselves. And therefore, not even considering the other ways in which we are superior, but considering just this one virtue, we can bravely claim to stand higher than men on the ladder of living creatures. The actions of men, at least those with whom I have had dealings, are guided by *words* - ours by deeds.

The horse is killed before the end of the story, but the manner of the narrative, its technique, does not change:

Much later they put Serpukhovsky's body, which had experienced the world, which had eaten and drunk, into the ground. They could profitably send neither his hide, nor his flesh, nor his bones anywhere.

But since his dead body, which had gone about in the world for twenty years, was a great burden to everyone, its burial was only a superfluous embarrassment for the people. For a long time no one had needed him; for a long time he had been a burden on all. But nevertheless, the dead who buried the dead found it necessary to dress this bloated body, which immediately began to rot, in a good uniform and good boots; to lay it in a good new coffin with new tassels at the four corners, then to place this new

coffin in another of lead and ship it to Moscow; there to exhume ancient bones and at just that spot, to hide this putrefying body, swarming with maggots, in its new uniform and clean boots, and to cover it over completely with dirt.

Thus we see that at the end of the story Tolstoy continues to use the technique even though the motivation for it (the reason for its use) is gone.

In *War and Peace* Tolstoy uses the same technique in describing whole battles as if battles were something new. These descriptions are too long to quote; it would be necessary to extract a considerable part of the four-volume novel. But Tolstoy uses the same method in describing the drawing room and the theater:

The middle of the stage consisted of flat boards; by the sides stood painted pictures representing trees, and at the back a linen cloth was stretched down to the floor boards. Maidens in red bodices and white skirts sat on the middle of the stage. One, very fat, in a white silk dress, sat apart on a narrow bench to which a green pasteboard box was glued from behind. They were all singing something. When they had finished, the maiden in white approached the prompter's box. A man in silk with tight-fitting pants on his fat legs approached her with a plume and began to sing and spread his arms in dismay. The man in the tight pants finished his song alone; then the girl sang. After that both remained silent as the music resounded; and the man, obviously waiting to begin singing his part with her again, began to run his fingers over the hand of the girl in the white dress. They finished their song together, and everyone in the theater began to clap and shout. But the men and women on stage, who represented lovers, started to bow, smiling and raising their hands.

In the second act were pictures representing monuments and openings in the linen cloth representing the moonlight, and they raised lamp shades on a frame. As the musicians started to play the bass horn and counter-bass, a large number of people in black mantels poured onto the stage from right and left. The people, with something like daggers in their hands, started to wave their arms. Then still more people came running out and began to drag away the maiden who had been wearing a white dress but who now wore one of sky blue. They did not drag her off immediately, but sang with her for a long time before dragging her away. Three times they struck on something metallic behind the side scenes, and everyone got down on his knees and began to chant a prayer. Several times all of this activity was interrupted by enthusiastic shouts from the spectators...

Anyone who knows Tolstoy can find several hundred such passages in his work. His method of seeing things out of their normal context is also apparent in his last works. Tolstoy described the dogmas and rituals he attacked as if they were unfamiliar, substituting everyday meanings for the customarily religious meanings of the words common in church ritual. Many persons were painfully wounded; they considered it blasphemy to present as strange and monstrous what they accepted as sacred. Their reaction was due chiefly to the technique through which Tolstoy perceived and reported his environment. And after turning to what he had long avoided, Tolstoy found that his perceptions had unsettled his faith.

The technique of defamiliarization is not Tolstoy's alone. I cited Tolstoy because his work is generally known.

Now, having explained the nature of this technique, let us try to determine the approximate limits of its application. I personally feel that defamiliarization is found almost everywhere form is found... An image is not a permanent referent for those mutable complexities of life which are revealed through it, its purpose is not to make

us perceive meaning, but to create a special perception of the object - *it creates a vision of the object instead of serving as a means for knowing it*

Such constructions as "the pestle and the mortar," or "Old Nick and the infernal regions" (*Decameron*) are also examples of the technique of defamiliarization. And in my article on plot construction I write about defamiliarization in psychological parallelism. Here, then, I repeat that the perception of disharmony in a harmonious context is important in parallelism. The purpose of parallelism, like the general purpose of imagery, is to transfer the usual perception of an object into the sphere of new perception - that is, to make a unique semantic modification.

In studying poetic speech in its phonetic and lexical structure as well as in its characteristic distribution of words and in the characteristic thought structures compounded from the words, we find everywhere the artistic trademark - that is, we find material obviously created to remove the automatism or perception; the author's purpose is to create the vision which results from that deautomatized perception. A work is created "artistically" so that its perception is impeded and the greatest possible effect is produced through the slowness of the perception. As a result of this lingering, the object is perceived not in its extension in space, but, so to speak, in its continuity. Thus "poetic language" gives satisfaction. According to Aristotle, poetic language must appear strange and wonderful; and, in fact, it is often actually foreign: the Sumerian used by the Assyrians, the Latin of Europe during the Middle Ages, the Arabisms of the Persians, the Old Bulgarian of Russian literature, or the elevated, almost literary language of folk songs. The common archaisms of poetic language, the intricacy of the sweet new style [*dolce stil nuovo*], the obscure style of the language of Arnaut Daniel with the "roughened" [*harte*] forms *which make pronunciation difficult* - these are used in much the same way. Leo Jakubinsky has demonstrated the principle of phonetic "roughening" of poetic language in the particular case of the repetition of identical sounds. The language of poetry is, then, a difficult, roughened, impeded language. In a few special instances the language of poetry approximates the language of prose, but this does not violate the principle of "roughened" form.

Her sister was called Tatyana For
the first time we shall Willfully
brighten the delicate Pages of a
novel with such a name

wrote Pushkin. The usual poetic language for Pushkin's contemporaries was the elegant style of Derzhavin; but Pushkin's style, because it seemed trivial then, was unexpectedly difficult for them. We should remember the consternation of Pushkin's contemporaries over the vulgarity of his expressions. He used the popular language as a special device for prolonging attention, just as his contemporaries generally used Russian words in their usually French speech (see Tolstoy's examples in *War and Peace*).

Just now a still more characteristic phenomenon is under way. Russian literary language, which was originally foreign to Russia, has so permeated the language of the people that it has blended with their conversation. On the other hand, literature has now begun to show a tendency towards the use of dialects (Remizov, Klyuyev, Essenin, and others, so unequal in talent and so alike in language, are intentionally provincial) and/or barbarisms (which gave rise to the Severyanin group). And

currently Maxim Gorky is changing his diction from the old literary language to the new literary colloquialism of Leskov. Ordinary speech and literary language have thereby changed places (see the work of Vyacheslav Ivanov and many others). And finally, a strong tendency, led by Khlebnikov, to create a new and properly poetic language has emerged. In the light of these developments we can define poetry as *attenuated, tortuous speech*. Poetic speech *informed speech*. Prose is ordinary speech -economical, easy, proper, the goddess of prose [*dea prosae*] is a goddess of the accurate, facile type, of the "direct" expression of a child. I shall discuss roughened form and retardation as the general *lam* of art at greater length in an article on plot construction.⁹

Nevertheless, the position of those who urge the idea of the economy of artistic energy as something which exists in and even distinguishes poetic language seems, at first glance, tenable for the problem rhythm. Spencer's description of rhythm would seem to be absolutely incontestable:

Just as the body in receiving a series of varying concussions, must keep the muscles ready to meet the most violent of them, as not knowing when such may come: so, the mind in receiving unarranged articulations, must keep its perspectives active enough to recognize the least easily caught sounds. And as, if the concussions recur in definite order, the body may husband its forces by adjusting the resistance needful for each concussion; so, if the syllables be rhythmically arranged, the mind may economize its energies by anticipating the attention required for each syllable.

This apparent observation suffers from the common fallacy, the confusion of the laws of poetic and prosaic language. In *The Philosophy of Style* Spencer failed utterly to distinguish between them. But rhythm may have two functions. The rhythm of prose, or a work song like "Dubinushka," permits the members of the work crew to do their necessary "groaning together" and also eases the work by making it automatic. And, in fact, it is easier to march with music than without it, and to march during an animated conversation is even easier, for the walking is done unconsciously. Thus the rhythm of prose is an important automatizing element; the rhythm of poetry is not. There is "order" in art, yet not a single column of a Greek temple stands exactly in its proper order; poetic rhythm is similarly disordered rhythm. Attempts to systematize the irregularities have been made, and such attempts are part of the current problem in the theory of rhythm. It is obvious that the systematization will not work, for in reality the problem is not one of complicating the rhythm but of disordering the rhythm - a disordering which cannot be predicted. Should the disordering of rhythm become a convention, it would be ineffective as a procedure for the roughening of language. But I will not discuss rhythm in more detail since I intend to write a book about it.

Notes

The Formalist Critics

Cleanth Brooks

Published (1951) in *The Raritan Review*, this polemic in favor of the New Criticism was written by one of the major practitioners and promoters of the new approach to literature - Cleanth Brooks. Brooks had studied in Cambridge with I. A. Richards, who first laid the foundation for the New Criticism in his *Principles of Literary Criticism* (1924). Upon his return to the United States, Brooks began writing a series of books, from *An Approach to Literature* (1936) to *The Well-Wrought Urn: Studies in the Structure of Poetry* (1947), that helped establish "close reading" as the dominant form of literary study in the American academy from the 1940s through the late 1960s.

Here are some articles of faith I could subscribe to:

That literary criticism is a description and an evaluation of its object.

That the primary concern of criticism is with the problem of unity - the kind of whole which the literary work forms or fails to form, and the relation of the various parts to each other in building up this whole. That the formal relations in a work of literature may include, but certainly exceed,

those of logic. That in a successful work, form and content cannot be separated. That form is meaning.

That literature is ultimately metaphorical and symbolic. That the general and the universal are not seized upon by abstraction, but got at

through the concrete and the particular. That literature is not a surrogate for religion. That, as Allen Tate says, "specific moral problems" are the subject matter of literature,

but that the purpose of literature is not to point a moral. That the principles of criticism define the area relevant to literary criticism; they do not constitute a method for carrying out the criticism.

Such statements as these would not, however, even though greatly elaborated, serve any useful purpose here. The interested reader already knows the general nature of the critical position adumbrated - or, if he does not, he can find it set forth in writings of mine or of other critics of like sympathy. Moreover, a condensed restatement of the position here would probably beget as many misunderstandings as have past attempts to set it forth. It seems much more profitable to use the present occasion for dealing with some persistent misunderstandings and objections.

In the first place, to make the poem or the novel the central concern of criticism has appeared to mean cutting it loose from its author and from his life as a man, with his own particular hopes, fears, interests, conflicts, etc. A criticism so limited may seem bloodless and hollow. It will seem so to the typical professor of literature in the graduate school, where the study of literature is still primarily a study of the ideas and personality of the author as revealed in his letters, his diaries, and the recorded conversations of his friends. It will certainly seem so to literary gossip columnists who purvey literary chitchat. It may also seem so to the young poet or novelist, beset with his own problems of composition and with his struggles to find a subject and a style and to get a hearing for himself.

In the second place, to emphasize the work seems to involve severing it from those who actually read it, and this severance may seem drastic and therefore disastrous. After all, literature is written to be read. Wordsworth's poet was a man speaking to men. In each *Sunday Times*, Mx J. Donald Adams points out that the hungry sheep look up and are not fed; and less strenuous moralists than Mr Adams are bound to feel a proper revulsion against "mere aestheticism." Moreover, if we neglect the audience which reads the work, including that for which it was presumably written, the literary historian is prompt to point out that the kind of audience that Pope had did condition the kind of poetry that he wrote. The poem has its roots in history, past or present. Its place in the historical context simply cannot be ignored.

I have stated these objections as sharply as I can because I am sympathetic with the state of mind which is prone to voice them. Man's experience is indeed a seamless garment, no part of which can be separated from the rest. Yet if we urge this fact, of inseparability against the drawing of distinctions, then there is no point in talking about criticism at all. I am assuming that distinctions are necessary and useful and indeed inevitable.

The formalist critic knows as well as anyone that poems and plays and novels are written by men - that they do not somehow happen - and that they are written as expressions of particular personalities and are written from all sorts of motives - for money, from a desire to express oneself, for the sake of a cause, etc. Moreover, the formalist critic knows as well as anyone that literary works are mere potential until they are read - that is, that they are recreated in the minds of actual readers, who vary enormously in their capabilities, their interests, their prejudices, their ideas. But the formalist critic is concerned primarily with the work itself. Speculation on the mental processes of the author takes the critic away from the work into biography and psychology. There is no reason, of course, why he should not turn away into biography and psychology. Such explorations are very much worth making. But they should not be confused with an account of the work. Such studies describe the process of composition, not the structure of the thing composed, and they may be performed quite as validly for the poor work as for the good one. They may be validly performed for any kind of expression - nonliterary as well as literary.

On the other hand, exploration of the various readings which the work has received also takes the critic away from the work into psychology and the history of taste. The various imports of a given work may well be worth studying. I. A. Richards has put us all in his debt by demonstrating what different experiences may be derived from the same poem by an apparently homogeneous group of readers; and the scholars have pointed out, all along, how different Shakespeare appeared to an eighteenth-century as compared with a nineteenth-century audience; or how sharply

divergent are the estimates of John Donne's lyrics from historical period to historical period. But such work, valuable and necessary as it may be, is to be distinguished from a criticism of the work itself. The formalist critic, because he wants to criticize the work itself, makes two assumptions: (1) he assumes that the relevant part of the author's intention is what he got actually into his work; that is, he assumes that the author's intention as realized is the "intention" that counts, not necessarily what he was conscious of trying to do, or what he now remembers he was then trying to do. And (2) the formalist critic assumes an ideal reader: that is, instead of focusing on the varying spectrum of possible readings, he attempts to find a central point of reference from which he can focus upon the structure of the poem or novel.

But there *is* no ideal reader, someone is prompt to point out, and he will probably add that it is sheer arrogance that allows the critic, with his own blindides and prejudice, to put himself in the position of that ideal reader. There is no ideal reader, of course, and I suppose that the practicing critic can never be too often reminded of the gap between his reading and the "true" reading of the poem. But for the purpose of focusing upon the poem rather than upon his own reactions, it is a defensible strategy. Finally, of course, it is the strategy that all critics of whatever persuasion are forced to adopt. (The alternatives are desperate: either we say that one person's reading is as good as another's and equate those readings on a basis of absolute equality and thus deny the possibility of any standard reading. Or else we take a lowest common denominator of the various readings that have been made; that is, we frankly move from literary criticism into socio-psychology. To propose taking a consensus of the opinions of "qualified" readers is simply to split the ideal reader into a group of ideal readers.) As consequences of the distinction just referred to, the formalist critic rejects two popular tests for literary value. The first proves the value of the work from the author's "sincerity" (or the intensity of the author's feelings as he composed it). If we heard that Mr Guest testified that he put his heart and soul into his poems, we would not be very much impressed, though I should see no reason to doubt such a statement from Mr Guest. It would simply be critically irrelevant. Ernest Hemingway's statement in a recent issue of *Time* magazine that he counts his last novel his best is of interest for Hemingway's biography, but most readers of *Across the River and Into the Trees* would agree that it proves nothing at all about the value of the novel - that in this case the judgment is simply pathetically inept. We discount also such tests for poetry as that proposed by A. E. Housman - the bristling of his beard at the reading of a good poem. The intensity of his reaction has critical significance only in proportion as we have already learned to trust him as a reader. Even so, what it tells us is something about Housman - nothing decisive about the poem.

It is unfortunate if this playing down of such responses seems to deny humanity to either writer or reader. The critic may enjoy certain works very much and may be indeed intensely moved by them. I am, and I have no embarrassment in admitting the fact; but a detailed description of my emotional state on reading certain works has little to do with indicating to an interested reader what the work is and how the parts of it are related.

Should all criticism, then, be self-effacing and analytic? I hope that the answer is implicit in what I have already written, but I shall go on to spell it out. Of course not. That will depend upon the occasion and the audience. In practice, the critic's job is rarely a purely critical one. He is much more likely to be involved in dozens of

more or less related tasks, some of them trivial, some of them important. He may be trying to get a hearing for a new author, or to get the attention of the freshman sitting in the back row. He may be comparing two authors, or editing a text; writing a brief newspaper review or reading a paper before the Modern Language Association. He may even be simply talking with a friend, talking about literature for the hell of it. Parable, anecdote, epigram, metaphor - these and a hundred other devices may be thoroughly legitimate for his varying purposes. He is certainly not to be asked to suppress his personal enthusiasms or his interest in social history or in politics. Least of all is he being asked to *present* his criticisms as the close reading of a text. Tact, common sense, and uncommon sense if he has it, are all requisite if the practicing critic is to do his various jobs well.

But it will do the critic no harm to have a clear idea of what his specific job as a critic is. I can sympathize with writers who are tired of reading rather drab "critical analyses," and who recommend brighter, more amateur, and more "human" criticism. As ideals, these are excellent; as recipes for improving criticism, I have my doubts. Appropriate vulgarizations of these ideals are already flourishing, and have long flourished - in the class room presided over by the college lecturer of infectious enthusiasm, in the gossipy Book-of-the-Month Club bulletins, and in the columns of the *Saturday Review of Literature*.

I have assigned the critic a modest, though I think an important, role. With reference to the help which the critic can give to the practicing artist, the role is even more modest. As critic, he can give only negative help. Literature is not written by formula: he can have no formula to offer. Perhaps he can do little more than indicate whether in his opinion the work has succeeded or failed. Healthy criticism and healthy creation do tend to go hand in hand. Everything else being equal, the creative artist is better off for being in touch with a vigorous criticism. But the other considerations are never equal, the case is always special, and in a given case the proper advice could be: quit reading criticism altogether, or read political science or history or philosophy - or join the army, or join the church.

There is certainly no doubt that the kind of specific and positive help that someone like Ezra Pound was able to give to several writers of our time is in one sense the most important kind of criticism that there can be. I think that it is not unrelated to the kind of criticism that I have described: there is the same intense concern with the text which is being built up, the same concern with "technical problems." But many other things are involved - matters which lie outside the specific ambit of criticism altogether; among them a knowledge of the personality of the particular writer, the ability to stimulate, to make positive suggestions.

A literary work is a document and as a document can be analyzed in terms of the forces that have produced it, or it may be manipulated as a force in its own right. It mirrors the past, it may influence the future. These facts it would be futile to deny, and I know of no critic who does deny them. But the reduction of a work of literature to its causes does not constitute literary criticism; nor does an estimate of its effects. Good literature is more than effective rhetoric applied to true ideas - even if we could agree upon a philosophical yardstick for measuring the truth of ideas and even if we could find some way that transcended nose-counting for determining the effectiveness of the rhetoric.

A recent essay by Lionel Trilling bears very emphatically upon this point. (I refer to him the more readily because Trilling has registered some of his objections to the

critical position that I maintain.) In the essay entitled "The Meaning of a Literary Idea," Trilling discusses the debt to Freud and Spengler of four American writers, O'Neill, Dos Passos, Wolfe, and Faulkner. Very justly, as it seems to me, he chooses Faulkner as the contemporary writer who, along with Ernest Hemingway, best illustrates the power and importance of ideas in literature. Trilling is thoroughly aware that his choice will seem shocking and perhaps perverse, "because," as he writes, "Hemingway and Faulkner have insisted on their indifference to the conscious intellectual tradition of our time and have acquired the reputation of achieving their effects by means that have the least possible connection with any sort of intellectuality or even with intelligence."

Here Trilling shows not only acute discernment but an admirable honesty in electing to deal with the hard cases - with the writers who do not clearly and easily make the case for the importance of ideas. I applaud the discernment and the honesty, but I wonder whether the whole discussion in his essay does not indicate that Trilling is really much closer to the so-called "new critics" than perhaps he is aware. For Trilling, one notices, rejects any simple one-to-one relation between the truth of the idea and the value of the literary work in which it is embodied. Moreover, he does not claim that "recognizable ideas of a force or weight are 'used' in the work," or "new ideas of a certain force and weight are 'produced' by the work." He praises rather the fact that we feel that Hemingway and Faulkner are "intensely at work upon the recalcitrant stuff of life." The last point is made the matter of real importance. Whereas Dos Passos, O'Neill, and Wolfe make us "feel that they feel that they have said the last word," "we seldom have the sense that [Hemingway and Faulkner] ... have misrepresented to themselves the nature and the difficulty of the matter they work on."

Trilling has chosen to state the situation in terms of the writer's activity (Faulkner is intensely at work, etc.). But this judgment is plainly an inference from the quality of Faulkner's novels - Trilling has not simply heard Faulkner say that he has had to struggle with his work. (I take it Mr Hemingway's declaration about the effort he put into the last novel impresses Trilling as little as it impresses the rest of us.)

Suppose, then, that we tried to state Mr Trilling's point, not in terms of the effort of the artist, but in terms of the structure of the work itself. Should we not get something very like the terms used by the formalist critics? A description in terms of "tensions," of symbolic development, of ironies and their resolution? In short, is not the formalist critic trying to describe in terms of the dynamic form of the work itself how the recalcitrancy of the material is acknowledged and dealt with?

Trilling's definition of "ideas" makes it still easier to accommodate my position to his. I have already quoted a passage in which he repudiates the notion that one has to show how recognizable ideas are "used" in the work, or new ideas are "produced" by the work. He goes on to write: "All that we need to do is account for a certain aesthetic effect as being in some important part achieved by a mental process which is not" "different from the process by which discursive ideas are conceived, and which is to be judged by some of the criteria by which an idea is judged." One would have to look far to find a critic "formal" enough to object to this. What some of us have been at pains to insist upon is that literature does not simply "exemplify" ideas or "produce" ideas - as Trilling acknowledges. But no one claims that the writer is an inspired idiot. He uses his mind and his reader ought to use his, in processes "not different from the process by which discursive ideas are conceived." Literature is not

inimical to ideas. It thrives upon ideas but it does not present ideas patly and neatly. It involves them with the "recalcitrant stuff of life." The literary critic's job is to deal with that involvement.

The mention of Faulkner invites a closing comment upon the critic's specific job. As I have described it, it may seem so modest that one could take its performance for granted. But consider the misreadings of Faulkner now current, some of them the work of the most brilliant critics that we have, some of them quite wrong-headed, and demonstrably so. What is true of Faulkner is only less true of many another author, including many writers of the past. Literature has many "uses" - and critics propose new uses, some of them exciting and spectacular. But all the multiform uses to which literature can be put rest finally upon our knowing what a given work "means." That knowledge is basic.

The Language of Paradox

Cleanth Brooks

In this essay from *The Well-Wrought Urn* (1947), Brooks defines the New Critical conception of poetry. Brooks' essay makes clear the debt the New Critics owed to Romanticism and especially to the idealist poetic theories of Wordsworth and Coleridge. Romanticism, in their work, represented an attempt to reassert the claims of religion in the face of the rationalist skeptical critique of religion that emerged in the eighteenth century. The New Criticism is in some respects a latter-day Romantic school of thought that also seeks to reintroduce religious meaning into literary study.

Few of us are prepared to accept the statement that the language of poetry is the language of paradox. Paradox is the language of sophistry, hard, bright, witty; it is hardly the language of the soul. We are willing to allow that paradox is a permissible weapon which a Chesterton may on occasion exploit. We may permit it in epigram, a special sub variety of poetry; and in satire, which though useful, we are hardly willing to allow to be poetry at all. Our prejudices force us to regard paradox as intellectual rather than emotional, clever rather than profound, rational rather than divinely irrational.

Yet there is a sense in which paradox is the language appropriate and inevitable to poetry. It is the scientist whose truth requires a language purged of every trace of paradox; apparently the truth which the poet utters can be approached only in terms of paradox. I overstate the case, to be sure; it is possible that the title of this chapter is itself to be treated as merely a paradox. But there are reasons for thinking that the overstatement which I propose may light up some elements in the nature of poetry which tend to be overlooked.

The case of William Wordsworth, for instance, is instructive on this point. His poetry would not appear to promise many examples of the language of paradox. He usually prefers the direct attack. He insists on simplicity; he distrusts whatever seems sophistical. And yet the typical Wordsworth poem is based upon a paradoxical situation. Consider his celebrated

It is a beauteous evening, calm and free,
The holy time is quiet as a Nun,
Breathless with adoration. ...

The poet is filled with worship, but the girl who walks beside him is not worshipping. The implication is that she should respond to the holy time, and become like the evening itself, nunlike; but she seems less worshipful than inanimate nature itself. Yet

If thou appear untouched by solemn thought,
Thy nature is not therefore less divine: Thou
liest in Abraham's bosom all the year; And
worship'st at the Temple's inner shrine, God
being with thee when we know it not

The underlying paradox (of which the enthusiastic reader may well be unconscious) is nevertheless thoroughly necessary, even for that reader. Why does the innocent girl worship more deeply than the self-conscious poet who walks beside her? Because she is filled with an unconscious sympathy for all of nature, not merely the grandiose and solemn. One remembers the lines from Wordsworth's friend, Coleridge:

He prayeth best, who loveth best
All things both great and small.

Her unconscious sympathy is the unconscious worship. She is in communion with nature "all the year," and her devotion is continual whereas that of the poet is sporadic and momentary. But we have not done with the paradox yet. It not only underlies the poem, but something of the paradox informs the poem, though, since this is Wordsworth, rather timidly. The comparison of the evening to the nun actually has more than one dimension. The calm of the evening obviously means "worship," even to the dull-witted and insensitive. It corresponds to the trappings of the nun, visible to everyone. Thus, it suggests not merely holiness, but, in the total poem, even a hint of Pharisaical holiness, with which the girl's careless innocence, itself a symbol of her continual secret worship, stands in contrast.

Or consider Wordsworth's sonnet, "Composed upon Westminster Bridge." I believe that most readers will agree that it is one of Wordsworth's most successful poems; yet most students have the greatest difficulty in accounting for its goodness. The attempt to account for it on the grounds of nobility of sentiment soon breaks down. On this level, the poem merely says: that the city in the morning light presents a picture which is majestic and touching to all but the most dull of soul; but the poem says very little more about the sight: the city is beautiful in the morning light and it is awfully still. The attempt to make a case for the poem in terms of the brilliance of its images also quickly breaks down: the student searches for graphic details in vain; there are next to no realistic touches. In fact, the poet simply huddles the details together:

silent, bare,
Ships, towers, domes, theatres, and temples lie
Open unto the fields...

We get a blurred impression - points of roofs and pinnacles along the skyline, all twinkling in the morning light. More than that, the sonnet as a whole contains some very flat writing and some well-worn comparisons.

The reader may ask: Where, then, does the poem get its power? It gets it, it seems to me, from the paradoxical situation out of which the poem arises. The speaker is honestly surprised, and he manages some sense of awed surprise into the poem. It is odd to the poet that the city should be able to "wear the beauty of the morning" at all. Mount Snowdon, Skiddaw, Mont Blanc - these wear it by natural right, but

surely not grimy, feverish London. This is the point of the almost shocked exclamation:

Never did sun more beautifully steep
In his first splendour, valley, rock, or hill...

The "smokeless air" reveals a city which the poet did not know existed: man-made London is a part of nature too, is lighted by the sun of nature, and lighted to as beautiful effect.

The river glideth at his own sweet will ...

A river is the most "natural" thing that one can imagine; it has the elasticity, the curved line of nature itself. The poet had never been able to regard this one as a real river - now, uncluttered by barges, the river reveals itself as a natural thing, not at all disciplined into a rigid and mechanical pattern: it is like the daffodils, or the mountain brooks, artless, and whimsical, and "natural" as they. The poem closes, you will remember, as follows:

Dear God! the very houses seem asleep;
And all that mighty heart is lying still!

The city, in the poet's insight of the morning, has earned its right to be considered organic, not merely mechanical. That is why the stale metaphor of the sleeping houses is strangely renewed. The most exciting thing that the poet can say about the houses is that they are *asleep*. He has been in the habit of counting them dead -as just mechanical and inanimate; to say they are "asleep" is to say that they are alive, that they participate in the life of nature. In the same way, the tired old metaphor which sees a great city as a pulsating heart of empire becomes revived. It is only when the poet sees the city under the semblance of death that he can see it as actually alive - quick with the only life which he can accept, the organic life of "nature."

It is not my intention to exaggerate Wordsworth's own consciousness of the paradox involved. In this poem, he prefers, as is Usual with him, the frontal attack. But the situation is paradoxical here as in so many of his poems. In his preface to the second edition of the *Lyrical Ballads* Wordsworth stated that his general purpose was "to choose incidents and situations from common life" but so to treat them that "ordinary things should be presented to the mind in an unusual aspect." Coleridge was to state the purpose for him later, in terms which make even more evident Wordsworth's exploitation of the paradoxical: "Mr Wordsworth... was to propose to himself as his object, to give the charm of novelty to things of every day, and to excite a feeling analogous to the supernatural, by awakening the mind's attention from the lethargy of custom, and directing it to the loveliness and the wonders of the world before us ..." Wordsworth, in short, was consciously attempting to show his audience that the common was really uncommon, the prosaic was really poetic.

Coleridge's terms, "the charm of novelty to things of every day," "awakening the mind," suggest the Romantic preoccupation with wonder - the surprise, the revelation which puts the tarnished familiar world in a new light. This may well be the

raison d'être of most Romantic paradoxes; and yet the neo-classic poets use paradox for much the same reason. Consider Pope's lines from "The Essay on Man":

In doubt his Mind or Body to prefer; Born
but to die, and reas'ning but to err; Alike in
ignorance, his Reason such, Whether he
thinks too little, or too much ...

Created half to rise, and half to fall; Great
Lord of all things, yet a Prey to all; Sole
Judge of Truth, in endless Error hurl'd; The
Glory, Jest, and Riddle of the world!

Here, it is true, the paradoxes insist on the irony, rather than the wonder. But Pope too might have claimed that he was treating the things of everyday, man himself, and awakening his mind so that he would view himself in a new and blinding light. Thus, there is a certain awed wonder in Pope just as there is a certain trace of irony implicit in the Wordsworth sonnets. There is, of course, no reason why they should not occur together, and they do. Wonder and irony merge in many of the lyrics of Blake; they merge in Coleridge's *Ancient Mariner*. The variations in emphasis are numerous. Gray's "Elegy" uses a typical Wordsworth "situation" with the rural scene and with peasants contemplated in the light of their "betters." But in the "Elegy" the balance is heavily tilted in the direction of irony, the revelation an ironic rather than a startling one:

Can storied urn or animated bust Back to its
mansion call the fleeting breath? Can
Honour's voice provoke the silent dust? Or
Flatt'ry sooth the dull cold ear of Death?

But I am not here interested in enumerating the possible variations; I am interested rather in our seeing that the paradoxes spring from the very nature of the poet's language: it is a language in which the connotations play as great a part as the denotations. And I do not mean that the connotations are important as supplying some sort of frill or trimming, something external to the real matter in hand. I mean that the poet does not use a notation at all - as the scientist may properly be said to do so. The poet, within limits, has to make up his language as he goes.

T. S. Eliot has commented upon "that perpetual slight alteration of language, words perpetually juxtaposed in new and sudden combinations," which occurs in poetry. It is perpetual; it cannot be kept out of the poem; it can only be directed and controlled. The tendency of science is necessarily to stabilize terms, to freeze them into strict denotations; the poet's tendency is by contrast disruptive. The terms are continually modifying each other, and thus violating their dictionary meanings. To take a very simple example, consider the adjectives in the first lines of Wordsworth's evening sonnet: *beauteous, calm, free, holy, quiet, breathless*. The juxtapositions are hardly startling; and yet notice this: the evening is like a nun breathless with adoration. The adjective "breathless" suggests tremendous excitement; and yet the evening is not only quiet but *calm*. There is no final contradiction, to be sure: it is *that* kind of calm and *that* kind of excitement, and the two states may well occur together. But the poet has no one term. Even if he had a polysyllabic technical term,

the term would not provide the solution for his problem. He must work by contradiction and qualification.

We may approach the problem in this way: the poet has to work by analogies. All of the subtler states of emotion, as I. A. Richards has pointed out, necessarily demand metaphor for their expression. The poet must work by analogies, but the metaphors do not lie in the same plane or fit neatly edge to edge. There is a continual tilting of the planes; necessary overlappings, discrepancies, contradictions. Even the most direct and simple poet is forced into paradoxes far more often than we think, if we are sufficiently alive to what he is doing.

But in dilating on the difficulties of the poet's task, I do not want to leave the impression that it is a task which necessarily defeats him, or even that with his method he may not win to a fine precision. To use Shakespeare's figure, he can

with assays of bias
By indirections find directions out.

Shakespeare had in mind the game of lawn bowls in which the bowl is distorted, a distortion which allows the skillful player to bowl a curve. To elaborate the figure, science makes use of the perfect sphere and its attack can be direct. The method of art can, I believe, never be direct - is always indirect. But that does not mean that the master of the game cannot place the bowl where he wants it. The serious difficulties will only occur when he confuses his game with that of science and mistakes the nature of his appropriate instrument. Mr Stuart Chase a few years ago, with a touching naivete, urged us to take the distortion out of the bowl - to treat language like notation.

I have said that even the apparently simple and straightforward poet is forced into paradoxes by the nature of his instrument. Seeing this, we should not be surprised to find poets who consciously employ it to gain a compression and precision otherwise unobtainable. Such a method, like any other, carries with it its own perils. But the dangers are not overpowering; the poem is not predetermined to a shallow and glittering sophistry. The method is an extension of the normal language of poetry, not a perversion of it.

I should like to refer the reader to a concrete case.

Donne's "Canonization" ought to provide a sufficiently extreme instance. The basic metaphor which underlies the poem (and which is reflected in the title) involves a sort of paradox. For the poet daringly treats profane love as if it were divine love. The canonization is not that of a pair of holy anchorites who have renounced the world and the flesh. The hermitage of each is the other's body; but they do renounce the world, and so their title to sainthood is cunningly argued. The poem then is a parody of Christian sainthood; but it is an intensely serious parody of a sort that modern man, habituated as he is to an easy yes or no, can hardly understand. He refuses to accept the paradox as a serious rhetorical device; and since he is able to accept it only as a cheap trick, he is forced into this dilemma. Either: Donne does not take love seriously; here he is merely sharpening his wit as a sort of mechanical exercise. Or: Donne does not take sainthood seriously; here he is merely indulging in a cynical and bawdy parody.

Neither account is true; a reading of the poem will show that Donne takes both love and religion seriously; it will show, further, that the paradox is here his inevit-

able instrument. But to see this plainly will require a closer reading than most of us give to poetry.

The poem opens dramatically on a note of exasperation. The "you" whom the speaker addresses is not identified. We can imagine that it is a person, perhaps a friend, who is objecting to the speaker's love affair. At any rate, the person represents the practical world which regards love as a silly affectation. To use the metaphor on which the poem is built, the friend represents the secular world which the lovers have renounced.

Donne begins to suggest this metaphor in the first stanza by the contemptuous alternatives which he suggests to the friend:

... chide my palsie, or my gout,
My five gray haire, or ruin'd fortune flout...

The implications are: (1) All right, consider my love as an infirmity, as a disease, if you will, but confine yourself to my other infirmities, my palsy, my approaching old age, my ruined fortune. You stand a better chance of curing those; in chiding me for this one, you are simply wasting your time as well as mine. (2) Why don't you pay attention to your own welfare - go on and get wealth and honor for yourself. What should you care if I do give these up in pursuing my love?

The two main categories of secular success are neatly, and contemptuously epitomized in the line

Or the Kings reall, or his stamped face...

Cultivate the court and gaze at the king's face there, or, if you prefer, get into business and look at his face stamped on coins. But let me alone.

This conflict between the "real" world and the lover absorbed in the world of love runs through the poem; it dominates the second stanza in which the torments of love, so vivid to the lover, affect the real world not at all -

What merchants ships have my sighs drown'd?

It is touched on in the fourth stanza in the contrast between the word "Chronicle" which suggests secular history with its pomp and magnificence, the history of kings and princes, and the word "sonnets" with its suggestions of trivial and precious intricacy. The conflict appears again in the last stanza, only to be resolved when the unworldly lovers, love's saints who have given up the world, paradoxically achieve a more intense world. But here the paradox is still contained in, and supported by, the dominant metaphor: so does the holy anchorite win a better world by giving up this one.

But before going on to discuss this development of the theme, it is important to see what else the second stanza does. For it is in this second stanza and the third, that the poet shifts the tone of the poem, modulating from the note of irritation with which the poem opens into the quite different tone with which it closes.

Donne accomplishes the modulation of tone by what may be called an analysis of love-metaphor. Here, as in many of his poems, he shows that he is thoroughly self-conscious about what he is doing. This second stanza, he fills with the conventionalized figures of the Petrarchan tradition: the wind of lovers' sighs, the floods of lovers'

tears, etc. - extravagant figures with which the contemptuous secular friend might be expected to tease the lover. The implication is that the poet himself recognizes the absurdity of the Petrarchan love-metaphors. But what of it? The very absurdity of the jargon which lovers are expected to talk makes for his argument: their love, however absurd it may appear to the world, does no harm to the world. The practical friend need have no fears: there will still be wars to fight and lawsuits to argue.

The opening of the third stanza suggests that this vein of irony is to be maintained. The poet points out to his friend the infinite fund of such absurdities which can be applied to lovers:

Call her one, mee another flye,
We're Tapers too, and at our owne cost die...

For that matter, the lovers can conjure up for themselves plenty of such fantastic comparisons: they know what the world thinks of them. But these figures of the third stanza are no longer the threadbare Petrarchan conventionalities; they have sharpness and bite. The last one, the likening of the lovers to the phoenix, is fully serious, and with it, the tone has shifted from ironic banter into a defiant but controlled tenderness.

The effect of the poet's implied awareness of the lovers' apparent madness is to cleanse and revivify metaphor; to indicate the sense in which the poet accepts it, and thus to prepare us for accepting seriously the fine and seriously intended metaphors which dominate the last two stanzas of the poem.

The opening line of the fourth stanza,

Wee can dye by it, if not live by love,

achieves an effect of tenderness and deliberate resolution. The lovers are ready to die to the world; they are committed; they are not callow but confident. (The basic metaphor of the saint, one notices, is being carried on; the lovers in their renunciation of the world have something of the confident resolution of the saint. By the bye, the word "legend"

... if unfit for tombes and hearse
Our legend bee -

in Donne's time meant "the life of a saint.") The lovers are willing to forego the ponderous and stately chronicle and to accept the trifling and insubstantial "sonnet" instead; but then if the urn be well wrought it provides a finer memorial for one's ashes than does the pompous and grotesque monument. With the finely contemptuous, yet quiet phrase, "halfe-acre tombes," the world which the lovers reject expands into something gross and vulgar. But the figure works further; the pretty sonnets will not merely hold their ashes as a decent earthly memorial. Their legend, their story, will gain them canonization; and approved as love's saints, other lovers will invoke them.

In this last stanza, the theme receives a final complication. The lovers in rejecting life actually win to the most intense life. This paradox has been hinted at earlier in the phoenix metaphor. Here it receives a powerful dramatization. The lovers in becoming hermits, find that they have not lost the world, but have gained the world

in each other, now a more intense, more meaningful world. Donne is not content to treat the lovers' discovery as something which comes to them passively, but rather as something which they actively achieve. They are like the saint, God's athlete:

Who did the whole worlds soule contract, and drove
Into the glasses of your eyes. ...

The image is that of a violent squeezing as of a powerful hand. And what do the lovers "drive" into each other's eyes? The "Countries, Townes," and "Courts," which they renounced in the first stanza of the poem. The unworldly lovers thus become the most "worldly" of all.

The tone with which the poem closes is one of triumphant achievement, but the tone is a development contributed to by various earlier elements. One of the more important elements which works toward our acceptance of the final paradox is the figure of the phoenix, which will bear a little further analysis.

The comparison of the lovers to the phoenix is very skillfully related to the two earlier comparisons, that in which the lovers are like burning tapers, and that in which they are like the eagle and the dove. The phoenix comparison gathers up both: the phoenix is a bird, and like the tapers, it burns. We have a selected series of items: the phoenix figure seems to come in a natural stream of association. "Call us what you will," the lover says, and rattles off in his desperation the first comparisons that occur to him. The comparison to the phoenix seems thus merely another outlandish one, the most outrageous of all. But it is this most fantastic one, stumbled over apparently in his haste, that the poet goes on to develop. It really describes the lovers best and justifies their renunciation. For the phoenix is not two but one, "we two being one, are it"; and it burns, not like the taper at its own cost, but to live again. Its death is life: "Wee dye and rise the same ..." The poet literally justifies the fantastic assertion. In the sixteenth and seventeenth centuries to "die" means to experience the consummation of the act of love. The lovers after the act are the same. Their love is not exhausted in mere lust. This is their title to canonization. Their love is like the phoenix.

I hope that I do not seem to juggle the meaning of die. The meaning that I have cited can be abundantly justified in the literature of the period; Shakespeare uses "die" in this sense; so does Dryden. Moreover, I do not think that I give it undue emphasis. The word is in a crucial position. On it is pivoted the transition to the next stanza,

Wee can dye by it, if not live by love,
And if unfit for tombes ...

Most important of all, the sexual submeaning of "die" does not contradict the other meanings: the poet is saying: "Our death is really a more intense life"; "We can afford to trade life (the world) for death (love), for that death is the consummation of life"; "After all, one does not expect to live by love, one expects, and wants, to die by it." But in the total passage he is also saying: "Because our love is not mundane, we can give up the world"; "Because our love is not merely lust, we can give up the other lusts, the lust for wealth and power"; "because," and this is said with an inflection of irony as by one who knows the world too well, "because our love can outlast its consummation, we are a minor miracle, we are love's saints." This passage

with its ironical tenderness and its realism feeds and supports the brilliant paradox with which the poem closes.

There is one more factor in developing and sustaining the final effect. The poem is an instance of the doctrine which it asserts; it is both the assertion and the realization of the assertion. The poet has actually before our eyes built within the song the "pretty room" with which he says the lovers can be content. The poem itself is the well-wrought urn which can hold the lovers' ashes and which will not suffer in comparison with the prince's "halfe-acre tomb."

And how necessary are the paradoxes? Donne might have said directly, "Love in a cottage is enough." "The Canonization" contains this admirable thesis, but it contains a great deal more. He might have been as forthright as a later lyricist who wrote, "We'll build a sweet little nest, / Somewhere out in the West, / And let the rest of the world go by." He might even have imitated that more metaphysical lyric, which maintains[^] "You're the cream in my coffee." "The Canonization" touches on all these observations, but it goes beyond them, not merely in dignity, but in precision.

I submit that the only way by which the poet could say what "The Canonization" says is by paradox. More direct methods may be tempting, but all of them enfeeble and distort what is to be said. This statement may seem the less surprising when we reflect on how many of the important things which the poet has to say have to be said by means of paradox: most of the language of lovers is such - "The Canonization" is a good example; so is most of the language of religion - "He who would save his life, must lose it"; "The last shall be first." Indeed, almost any insight important enough to warrant a great poem apparently has to be stated in such terms. Deprived of the character of paradox with its twin concomitants of irony and wonder, the matter of Donne's poem unravels into "facts," biological, sociological, and economic. What happens to Donne's lovers if we consider them "scientifically," without benefit of the supernaturalism which the poet confers upon them? Well, what happens to Shakespeare's lovers, for Shakespeare uses the basic metaphor of "The Canonization" in his *Romeo and Juliet*? In their first conversation, the lovers play with the analogy between the lover and the pilgrim to the Holy Land. Juliet says:

For saints have hands that pilgrims' hands do touch and palm to palm is holy palmers' kiss.

Considered scientifically, the lovers become Mr Aldous Huxley's animals, "quietly sweating, palm to palm."

For us today, Donne's imagination seems obsessed with the problem of unity; the sense in which the soul is united with God. Frequently, as we have seen, one type of union becomes a metaphor for the other. It may not be too far-fetched to see both as instances of, and metaphors for, the union which the creative imagination itself effects. Coleridge has of course given us the classic description of its nature and power. It "reveals itself in the balance or reconciliation of opposite or discordant qualities: of sameness, with difference; of the general, with the concrete; the idea, with the image; the individual, with the representative; the sense of novelty and freshness, with old and familiar objects; a more than usual state of emotion, with more than usual order ..." It is a great and illuminating statement, but is a series of paradoxes. Apparently Coleridge could describe the effect of the imagination in no other way.

Shakespeare, in one of his poems, has given a description that oddly parallels that of Coleridge.

Reason in it selfe confounded, Saw
Division grow together, To
themselves yet either neither,
Simple were so well compounded.

I do not know what his "The Phoenix and the Turtle" celebrates. Perhaps it *was* written to honor the marriage of Sir John Salisbury and Ursula Stanley; or perhaps the Phoenix is Lucy, Countess of Bedford; or perhaps the poem is merely an essay on Platonic love. But the scholars themselves are so uncertain, that I think we will do little violence to established habits of thinking, if we boldly pre-empt the poem for our own purposes. Certainly the poem is an instance of that magic power which Coleridge sought to describe. I propose that we take it for a moment as a poem about that power;

So they loved as love in twaine, Had
the essence but in one, Two distincts,
Division none, Number there in love
was slaine.

Hearts remote, yet not asunder;
Distance and no space was seene,
Twixt this Turtle and his Queene; But
in them it were a wonder ...

Propertie was thus appalled, That was the
selfe was not the same; Single Natures
double name, Neither two no one was
called.

Precisely! The nature is single, one, unified. But the name is double, and today with our multiplication of sciences, it is multiple. If the poet is to be true to his poetry, he must call it neither two nor one: the paradox is his only solution. The difficulty has intensified since Shakespeare's day: the timid poet, when confronted with the problem of "Single Natures double name," has too often flunked it. A history of poetry from Dryden's time to our own might bear as its subtitle "The Half-Hearted Phoenix."

In Shakespeare's poem, Reason is "in it selfe confounded" at the union of the Phoenix and the Turtle; but it recovers to admit its own bankruptcy:

Love hath Reason, Reason none,
If what parts, can so remaine...

and it is Reason which goes on to utter the beautiful threnos with which the poem concludes:

Beautie, Truth, and Raritie,
Grace in all simplicitie, Here
enclosed, in cinders lie.

Death is now the Phoenix nest, And
the Turtles loyall brest, To eternitie
doth rest...

Truth may seeme, but cannot be,
 Beautie bragge, but tis not she, Truth
 and Beautie buried be.

To this urne let those repaire,
 That are either true or faire,
 For these dead Birds, sigh a prayer.

Having pre-empted the poem for our own purposes, it may not be too outrageous to go on to make one further observation. The urn to which we are summoned, the urn which holds the ashes of the phoenix, is like the well-wrought urn of Donne's "Canonization" which holds the phoenix-lovers' ashes: it is the poem itself. One is reminded of still another urn, Keats's Grecian urn, which contained for Keats, Truth and Beauty, as Shakespeare's urn encloses "Beautie, Truth, and Raritie." But there is a sense in which all such well-wrought urns contain the ashes of a Phoenix. The urns are not meant for memorial purposes only, though that often seems to be their chief significance to the professors of literature. The phoenix rises from its ashes; or ought to rise; but it will not arise for all our mere sifting and measuring the ashes, or testing them for their chemical content. We must be prepared to accept the paradox of the imagination itself; else "Beautie, Truth, and Raritie" remain enclosed in their cinders and we shall end with essential cinders, for all our pains.

Appendix

"THE CANONIZATION" John
 Donne

For Godsake hold your tongue, and let me love,
 Or chide my palsie, or my gout, My five
 gray haire, or ruin'd fortune flout,
 With wealth your state, your minde with Arts improve, Take you
 a course, get you a place, Observe his honour, or his grace, Or
 the Kings reall, or his stamped face, Contemplate, what you will,
 approve, So you will let me love.

Alas, alas, who's injur'd by my love?
 What merchants ships have my sighs drown'd? Who
 saies my teares have overflow'd his ground? When did
 my colds a forward spring remove? When did the heats
 which my veines fill Adde one more to the plague
 Bill? Soldiers finde warres, and Lawyers finde out still
 Litigious men, which quarrels move, Though she and I
 do love.

Call us what you will, wee are made such by love; Call
 her one, mee another flye,

We're Tapers too, and at our owne cost die, And
wee in us finde the'Eagle and the Dove. The Phoenix
ridle hath more wit By us, we two being one, are it.
So to one neutrall thing both sexes fit, Wee dye and
rise the same, and prove Mysterious by this love.

Wee can dye by it, if not live by love, And if
unfit for tombes and hearse Our legend bee, it
will be fit for verse; And if no peece of
Chronicle wee prove, We'll build in sonnets
pretty roomes; As well a well wrought urne
becomes The greatest ashes, as halfe-acre
tombes, And by these hymnes, all shall approve
Us *Canoniz'd* for Love:

And thus invoke us; You whom reverend love
Made one anothers hermitage; You, to whom love
was peace, that now is rage;
Who did the whole worlds soule contract, and drove Into
the glasses of your eyes (So made such mirrors, and such
spies, That they did all to you epitomize.)
Countries, Townes, Courts: Beg from above A
patterne of your love!

The Structure of the Concrete Universal

W..K. Wimsatt, jr..

In this selection from *The Verbal Icon* (1954), a major statement of New Critical theory, W. K. Wimsatt argues that great literature embodies universal in concrete form. All great literature, therefore, is essentially metaphoric. It makes the general concrete and lends specific form to disembodied ideas. He concludes polemically that criticism should aim for the objective description of form - perhaps the central tenet of the New Criticism.

The central argument of this essay, concerning what I shall call the "concrete universal," proceeds from the observation that literary theorists have from early times to the present persisted in making statements which in their contexts seem to mean that a work of literary art is in some peculiar sense a very individual thing or a very universal thing or both. What that paradox can mean, or what important fact behind the paradox has been discerned by such various critics as Aristotle, Plotinus, Hegel, and Ransom, it will be the purpose of the essay to inquire, and by the inquiry to discuss not only a significant feature of metaphysical poetics from Aristotle to the present day but the relation between metaphysical poetics and more practical and specific rhetorical analysis. In the brief historical survey which forms one part of this essay it will not be my purpose to suggest that any of these writers meant exactly what I shall mean in later parts where I describe the structure of poetry. Yet throughout the essay I shall proceed on the theory not only that men have at different times used the same terms and have meant differently, but that they have sometimes used different terms and have meant the same or somewhat the same. In other words, I assume that there is continuity in the problems of criticism, and that a person who studies poetry today has a legitimate interest in what Plato said about poetry.

The view of common terms and their relations to classes of things from which I shall start is roughly that which one may read in the logic of J. S. Mill, a view which is not much different from the semantic view of today and for most purposes not much different from the Aristotelian and scholastic view. Mill speaks of the word and its denotation and connotation (the term, referent and reference, the sign, denotatum and designatum of more recent terminologies). The denotation is the *it*, the individual thing or the aggregate of things to which the term may refer; the connotation is the *what*, the quality or classification inferred for the *it*, or implicitly predi-

cated by the application of the term or the giving of the name.* One main difference between all modern positivistic, nominalistic, and semantic systems and the scholastic and classical systems is that the older ones stress the similarity of the individuals denoted by the common term and hence the real universality of meaning, while the modern systems stress the differences in the individuals, the constant flux even of each individual in time and space and its kinetic structure, and hence infer only an approximate or nominal universality of meaning and a convenience rather than a truth in the use of general terms. A further difference lies in the view of how the individual is related to the various connotations of terms which may be applied to it. That is, to the question: What is it? the older writers seem to hold there is but one (essentially right) answer, while the moderns accept as many answers as there are classes to which the individual may be assigned (an indefinite number). The older writers speak of a proper essence or whatness of the individual, a quality which in some cases at least is that designated by the class name most commonly applied to the individual: a bench is a bench, essentially a bench, accidentally a heavy wooden object or something covered with green paint. "When we say *what* it is," observes Aristotle, "we do not say 'white,' or 'hot,' or 'three cubits long,' but 'a man' or 'a sod.'"² And this view is also a habit scarcely avoidable in our own daily thinking, especially when we think of living things or of artifacts, things made by us or our fellows for a purpose. What is it? Bench, we think, is an adequate answer. An assemblage of sticks painted green, we consider freakish.

II

Whether or not one believes in universals, one may see the persistence in literary criticism of a theory that poetry presents the concrete and the universal, or the individual and the universal, or an object which in a mysterious and special way is both highly general and highly particular. The doctrine is implicit in Aristotle's two statements that poetry imitates action and that poetry tends to express the universal. It is implicit again at the end of the classic period in the mystic doctrine of Plotinus, who in his later writing on beauty reverses the Platonic objection that art does not know the ultimate reality of the forms. Plotinus arrives at the view that the artist by a kind of bypass of the inferior natural productions of the world soul reaches straight to the forms that lie behind in the divine intelligence. Another version of the classic theory, with affinities for Plotinus, lies in the scholastic phrase *resplendentia formae*.

Cicero's account of how Zeuxis painted an ideal Helen from the five most beautiful virgins of Crotona is a typical development of Aristotelian theory, in effect the familiar neoclassic theory found in Du Fresnoy's *Art of Painting*, in the writings of Johnson, especially in the tulip passage in *Rasselas*, and in the *Discourses* and *Idlers* of Reynolds. The business of the poet is not to number the streaks of the tulip; it is to give us not the individual, but the species. The same thing is stated in a more complicated way by Kant in telling how the imagination constructs the "aesthetical normal Idea":

* The terms "denotation" and "connotation" are commonly and loosely used by literary critics to distinguish the dictionary meaning of a term (denotation) from the vaguer aura of suggestion (connotation). Both these are parts of the connotation in the logical sense.

It is the image for the whole race, which floats among all the variously different intuitions of individuals, which nature takes as archetype in her productions of the same species, but which seems not to be fully reached in any individual case.

And Hegel's account is as follows:

The work of art is not only for the sensuous apprehension as sensuous object, but its position is of such a kind that as sensuous it is at the same time essentially addressed to the *mind*.⁵

In comparison with the show or semblance of immediate sensuous existence or of historical narrative, the artistic semblance has the advantage that in itself it points beyond self, and refers us away from itself to something spiritual which it is meant to bring before the mind's eye — The hard rind of nature and the common world give the mind more trouble in breaking through to the idea than do the products of art.⁶

The excellence of Shakespeare, says Coleridge, consists in a "union and interpenetration of the universal and particular." In one terminology or another this idea of a concrete universal is found in most metaphysical aesthetic of the eighteenth and nineteenth centuries.

A modern literary critic, John Crowe Ransom, speaks of the argument of a poem (the universal) and a local texture or tissue of concrete irrelevance. Another literary critic, Allen Tate, manipulating the logical terms "extension" and "intension," has arrived at the concept of "tension" in poetry. "Extension," as logicians use the word, is the range of individuals denoted by a term (denotation); "intension" is the total of qualities connoted (connotation). In the ordinary or logical use of the terms, extension and intension are of inverse relationship - the wider the one, the shallower the other. A poem, says Tate, as I interpret him, is a verbal structure which in some peculiar way has both a wide extension and a deep intension.

Not all these theories of the concrete universal lay equal stress on the two sides of the paradox, and it seems indicative of the vitality of the theory and of the truth implicit in it that the two sides have been capable of exaggeration into antithetic schools and theories of poetry. For Du Fresnoy, Johnson, and Reynolds poetry and painting give the universal; the less said about the particulars the better. This is the neoclassic theory, the illustrations of which we seek in Pope's *Essay on Man* or in Johnson's *Ramblers*, where the ideas are moral and general and concerned with "nature," "one clear, unchanged, and universal light." The opposite theory had notable expression in England, a few years before Johnson wrote *Rasselas*, in Joseph Warton's *Essay on Pope*:

A minute and particular enumeration of circumstances judiciously selected, is what chiefly discriminates poetry from history, and renders the former, for that reason, a more close and faithful representation of nature than the latter.

And Blake's marginal criticism of Reynolds was: "THIS Man was Hired to Depress art." "To Generalize is to be an Idiot. To Particularize is the Alone Distinction of Merit. General Knowledges are those Knowledges that Idiots possess." "Sacrifice the Parts: What becomes of the whole?" The line from Warton's *Essay* to Grace's *Aesthetic* seems a straight and obvious one, from Thomson's specific descriptions of

flowers to the individual act of intuition-expression which is art - its opposite and enemy being the concept or generality.⁷ The two views of art (two that can be held by different theorists about the same works of art) may be startlingly contrasted in the following passages about fictitious character - one a well known statement by Johnson, the other by the philosopher of the *elan vital*.

[Shakespeare's] characters are not modified by the customs of particular places, unpractised by the rest of the world; by the peculiarities of studies or professions, which can operate but upon small numbers; or by the accidents of transient fashions or temporary opinions: they are the genuine progeny of common humanity, such as the world will always supply, and observation will always find. His persons act and speak by the influence of those general passions and principles by which all minds are agitated, and the whole system of life is continued in motion. In the writings of other poets a character is too often an individual; in those of Shakespeare it is commonly a species.

Hence it follows that art always aims at what is *individual*. What the artist fixes on his canvas is something he has seen at a certain spot, on a certain day, at a certain hour, with a colouring that will never be seen again. What the poet sings of is a certain mood which was his, and his alone, and which will never return___ Nothing could be more unique than the character of Hamlet. Though he may resemble other men in some respects, it is clearly not on that account that he interests us most.

Other critics, notably the most ancient and the most modern, have tried to hold the extremes together. Neither of the extremes gives a good account of art and each leads out of art. The theory of particularity leads to individuality and originality (Edward Young was another eighteenth century Crocean), then to the idiosyncratic and the unintelligible and to the psychology of the author, which is not in the work of art and is not a standard for judgment. The theory of universality as it appears in Johnson and Reynolds leads to platitude and to a standard of material objectivity, the average tulip, the average human form, some sort of average.

III

"Just representations of general nature," said Johnson, and it ought to be noted, though it perhaps rarely is, that two kinds of generality are involved, as indeed they are in the whole neoclassic theory of generality. There is the generality of logic or classification, of the more general as opposed to the more specific, "essential" generality, one might say. And there is the generality of literal truth to nature, "existential" generality. The assumption of neoclassic theory seems to be that these two must coincide. As a matter of fact they may and often do, but need not. Thus: "purple cow" is a more general (less specific) term and concept than "tan cow with a broken horn," yet the latter is more general or true to nature. We have, in short, realism or fantasy, and in either there may be various degrees of the specific or the general. We have *A Journal of the Plague Year* and *The Rambler*, *Gulliver's Travels* and *Rasselas*. The fact that there are a greater number of "vicissitudes" and "miscarriages" (favorite *Rambler* events) in human experience than plagues at London, that there are more tan cows than tan cows with broken horns, makes it true in a sense that a greater degree of essential generality involves a greater degree of existential. But in this sense the most generally reliable concept is simply that of "being."

The question is how a work of literature can be either more individual (unique) or more universal than other kinds of writing, or how it can combine the individual and the universal more than other kinds. Every description in words, so far as it is a direct description ("The barn is red and square") is a generalization. That is the nature of words. There are no individuals conveyed in words but only more or less specific generalizations, so that Johnson is right, though we have to ask him what degree of verbal generality makes art, and whether "tulip" is a better or more important generality than "tulip with ten streaks," or whether "beauty" is not in fact a much more impressive generality than "tulip." On the other hand, one cannot deny that in some sense there are more tulips in poetry than pure abstracted beauty. So that Bergson is right too; only we shall have to ask him what degree of specificity in verbal description makes art. And he can never claim complete verbal specificity or individuality, even for Hamlet.

If he could, if a work of literary art could be looked on as an artifact or concrete physical work, the paradox for the student of universals would return from the opposite direction even more forcibly - as it does in fact for theorists of graphic art. If Reynolds' picture "The Age of Innocence" presents a species or universal, what species does it present? Not an Aristotelian essence - "a man," or "humanity," nor even a more specific kind of being such as "womanhood." For then the picture would present the same universal as Reynolds' portrait of Mrs. Siddons as "The Tragic Muse," and all differences between "The Age of Innocence" and "The Tragic Muse" would be aesthetically irrelevant. Does the picture then present girlhood, or barefoot girlhood, or barefoot girlhood in a white dress against a gloomy background? All three are equally valid universals (despite the fact that makeshift phrases are required to express two of them), and all three are presented by the picture. Or is it the title which tells us what universal is presented, "The Age of Innocence," and without the title should we not know the universal? The question will be: What in the individual work of art demands that we attribute to it one universal rather than another?

We may answer that for poetry it is the generalizing power of words already mentioned, and go on to decide that what distinguishes poetry from scientific or logical discourse is a degree of irrelevant concreteness in descriptive details. This is in effect what Ransom says in his doctrine of argument and local irrelevance, but it seems doubtful if the doctrine is not a version of the theory of ornamental metaphor. The argument, says Ransom, is the prose or scientific meaning, what the poem has in common with other kinds of writing. The irrelevance is a texture of concreteness which does not contribute anything to the argument but is somehow enjoyable or valuable for its own sake, the vehicle of a metaphor which one boards heedless of where it runs, whether crosstown or downtown - just for the ride. So Ransom nurses and refines the argument, and on one page he makes the remark that the poet searches for "suitability" in his particular phrases, and by suitability Ransom means "the propriety which consists in their denoting the particularity which really belongs to the logical object." But the difference between "propriety" and relevance in such a context is not easy to see. And relevance is logic. The fact is that all concrete illustration has about it something of the irrelevant. An apple falling from a tree illustrates gravity, but apple and tree are irrelevant to the pure theory of gravity. It may be that what happens in a poem is that the apple and the tree are somehow made more than usually relevant.

Such a theory, not that of Johnson and Reynolds, not that of Warton and Bergson, not quite that of Ransom, is what I would suggest - yet less as a novelty than as something already widely implicit in recent poetical analyses and exegeses, in those of Empson, for instance, Tate, Blackmur, or Brooks. If a work of literature is not in a simple sense either more individual or more universal than other kinds of writing, it may yet be such an individual or such a complex of meaning that it has a special relation to the world of universals. Some acute remarks on this subject were made by Ruskin in a chapter of *Modern Painters* neglected today perhaps because of its distasteful ingredient of "noble emotion." Poetry, says Ruskin in criticizing Reynolds' *Idlers*, is not distinguished from history by the omission of details, nor for that matter by the mere addition of details. "There must be something either in the nature of the details themselves, or the method of using them, which invests them with poetical power." Their nature, one may add, as assumed through their relation to one another, a relation which may also be called the method of using them. The poetic character of details consists not in what they say directly and explicitly (as if roses and moonlight were poetic) but in what by their arrangement they *show* implicitly.

IV

"One," observes Ben Jonson, thinking of literature, "is considerable two waies: either, as it is only separate, and by it self: or as being compos'd of many parts it beginnes to be one as those parts grow or are wrought together." A literary work of art is a complex of detail (an artifact, if we may be allowed that metaphor for what is only a verbal object), a composition so complicated of human values that its interpretation is dictated by the understanding of it, and so complicated as to seem in the highest degree individual - a concrete universal. We are accustomed to being told, for example, that what makes a character in fiction or drama vital is a certain fullness or rotundity: that the character has many sides. Thus E. M. Forster:

We may divide characters into flat and round. Flat characters were called "humours" in the seventeenth century, and are sometimes called types, and sometimes caricatures. In their purest form, they are constructed round a single idea or quality: when there is more than one factor in them, we get the beginning of the curve towards the round. The really flat character can be expressed in one sentence such as "I never will desert Mr. Micawber."

It remains to be said, however, that the many traits of the round character (if indeed it is one character and not a hodgepodge) are harmonized or unified, and that if this is so, then all the traits are chosen by a principle, just as are the traits of the flat character. Yet it cannot be that the difference between the round and flat character is simply numerical; the difference cannot be merely that the presiding principle is illustrated by more examples in the round character. Something further must be supposed - a special interrelation in the traits of the round character. Bobadil is an example of the *miles gloriosus*, a flat humour. He swears by "The foot of Pharaoh," takes tobacco, borrows money from his landlady, is found lying on a bench fully dressed with a hangover, brags about his feats at the siege of Strigonium, beats Cob, a poor water carrier, and so on. It is possible that he has numerically as many traits as Falstaff, one

of the most vital of all characters. But one of the differences between Falstaff and Bobadil is that the things Falstaff says are funny; the things Bobadil says are not. Compared to Falstaff, Bobadil is unconscious, an opaque butt. There is the vitality of consciousness in Falstaff. And further there is the crowning complexity of self-consciousness. The fact that Morgann could devote a book to arguing that Falstaff is not a coward, that lately Professor Wilson has argued that at Gadshill Falstaff may exhibit, " 'all the common symptoms of the malady' of cowardice" and at the same time persuade the audience that he has " 'never once lost his self-possession,' " the fact that one can conceive that Falstaff in the Gadshill running-away scene really knows that his assailants are the Prince and Poins - all this shows that in Falstaff there is a kind of interrelation among his attributes, his cowardice, his wit, his debauchery, his presumption, that makes them in a special way an organic harmony. He is a rounded character not only in the sense that he is gross (a fact which may have tempted critics to speak of a rounded character) or in the sense that he is a bigger bundle of attributes, stuffed more full, than Bobadil or Ralph Roister Doister; but in the sense that his attributes make a circuit and connection. A kind of awareness of self (a high and human characteristic), with a pleasure in the fact, is perhaps the central principle which instead of simplifying the attributes gives each one a special function in the whole, a double or reflex value. Falstaff or such a character of self-conscious "infinite variety" as Cleopatra are concrete universals because they have no class names, only their own proper ones, yet are structures of such precise variety and centrality that each demands a special interpretation in the realm of human values.

Character is one type of concrete universal; there are other types, as many perhaps as the central terms of criticism; but most can be learned I believe by examination of metaphor - the structure most characteristic of concentrated poetry. The language of poets, said Shelley, "is vitally metaphorical: that is, it marks the before unapprehended relations of things and perpetuates their apprehension." Wordsworth spoke of the abstracting and modifying powers of the imagination. Aristotle said that the greatest thing was the use of metaphor, because it meant an eye for resemblances. Even the simplest form of metaphor or simile ("My love is like a red, red rose") presents us with a special and creative, in fact a concrete, kind of abstraction different from that of science. For behind a metaphor lies a resemblance between two classes, and hence a more general third class. This class is unnamed and most likely remains unnamed and is apprehended only through the metaphor. It is a new conception for which there is no other expression. Keats discovering Homer is like a traveler in the realms of gold, like an astronomer who discovers a planet, like Cortez gazing at the Pacific. The title of the sonnet, "On First Looking into Chapman's Homer," seems to furnish not so much the subject of the poem as a fourth member of a central metaphor, the real subject of the poem being an abstraction, a certain kind of thrill in discovering, for which there is no name and no other description, only the four members of the metaphor pointing, as to the center of their pattern. The point of the poem seems to lie outside both vehicle and tenor.

To take a more complicated instance, Wordsworth's "Solitary Reaper" has the same basic metaphorical structure, the girl alone reaping and singing, and the two bird images, the nightingale in Arabian sands and the cuckoo among the Hebrides,

I do not mean that self-consciousness is the only principle of complexity in character, yet a considerable degree of it would appear to be a requisite for poetic interest.

the three figures serving the parallel or metaphorical function of bringing out the abstraction of loneliness, remoteness, mysterious charm in the singing. But there is also a kind of third-dimensional significance, in the fact that one bird is far out in the northern sea, the other far off in southern sands, a fact which is not part of the comparison between the birds and the girl. By an implication cutting across the plane of logic of the metaphor, the girl and the two birds suggest extension in space, universality, and world communication - an effect supported by other details of the poem such as the overflowing of the vale profound, the mystery of the Erse song, the bearing of the song away in the witness' heart, the past and future themes which the girl may be singing. Thus a central abstraction is created, of communication, telepathy in solitude, the prophetic soul of the wide world dreaming on things to come - an abstraction which is the effect not wholly of the metaphor elaborated logically (in a metaphysical way) but of a working on two axes, by association rather than by logic, by a three-dimensional complexity of structure.

To take yet a third instance, metaphoric structure may appear where we are less likely to realize it explicitly - in poetic narratives, for example, elliptically concealed in the more obvious narrative outlines. "I can bring you," writes Max Eastman, "examples of diction that is metrical but not metaphoric - a great part of the popular ballads, for example - and you can hardly deny that they too are poetic." But the best story poems may be analyzed, I believe, as metaphors without expressed tenors, as symbols which speak for themselves. "La Belle Dame Sans Merci," for example (if a literary ballad may be taken), is about a knight, by profession a man of action, but sensitive, like the lily and the rose, and about a faery lady with wild, wild eyes. At a more abstract level, it is about the loss of self in the mysterious lure of beauty - whether woman, poetry, or poppy. It sings the irretrievable departure from practical normality (the squirrel's granary is full), the wan isolation after ecstasy. Each reader will experience the poem at his own level of experience or at several. A good story poem is like a stone thrown into a pond, into our minds, where ever widening concentric circles of meaning go out - and this because of the structure of the story.

"A poem should not mean but be." It is an epigram worth quoting in every essay on poetry. And the poet "nothing affirmeth, and therefore never lieth." "Sit quid-vis," said Horace, "simplex dumtaxat et unum." It seems almost the reverse of the truth. "Complex dumtaxat et unum" would be better: Every real poem is a complex poem, and only in virtue of its complexity does it have artistic unity. A newspaper poem by Edgar Guest* does not have this kind of unity, but only the unity of an abstractly stated sentiment.

The principle is expressed by Aristotle when he says that beauty is based on unity in variety, and by Coleridge when he says that "The Beautiful, contemplated in its

A reader whose judgment I esteem tells me that such a name appears in a serious discussion of poetics anomalously and in bad taste. I have allowed it to remain (in preference to some more dignified name of mediocrity) precisely because I wish to insist on the existence of badness in poetry and so to establish an antithetic point of reference for the discussion of goodness. Relativistic argument often creates an illusion in its own favor by moving steadily in a realm of great and nearly great art. See, for example, George Boas, *A Primer for Critics* (Baltimore, 1937), where a cartoon by Daumier appears toward the end as a startling approach to the vulgar. The purpose of my essay is not judicial but theoretical, that is, not to exhibit original discoveries in taste, but to show the relationship between examples acknowledged to lie in the realms of the good and the bad.

essentials, that is, in *kind* and not in *degree*, is that in which the *many*, still seen as many becomes one," and that a work of art is "rich in proportion to the variety of parts which it holds in unity."

V

It is usually easier to show how poetry works than to show why anyone should want it to work in a, given way. Rhetorical analysis of poetry has always tended to separate from evaluation, technique from worth. The structure of poems as concrete and universal is the principle by which the critic can try to keep the two together. If it be granted that the "subject matter" of poetry is in a broad sense the moral realm, human actions as good or bad, with all their associated feelings, all the thought and imagination that goes with happiness and suffering (if poetry submits "the shews of things to the desires of the Mind"), then the rhetorical structure of the concrete universal, the complexity and unity of the poem, is also its maturity or sophistication or richness or depth, and hence its value. Complexity of form is sophistication of content. The unity and maturity of good poems are two sides of the same thing. The kind of unity which we look for and find in poetry is attained only through a degree of complexity in design which itself involves maturity and richness. For a visual diagram of the metaphysics of poetry one might write vertically the word complexity, a column, and give it a head with Janus faces, one looking in the rhetorical direction, unity, and the other in the axiological, maturity.

A final point to be made is that a criticism of structure and of value is an objective criticism. It rests on facts of human psychology (as that a man may love a woman so well as to give up empires), facts, which though psychological, yet are so well acknowledged as to lie in the realm of what may be called public psychology - a realm which one should distinguish from the private realm of the author's psychology and from the equally private realm of the individual reader's psychology (the vivid pictures which poetry or stories are supposed to create in the imagination, or the venerable action of catharsis - all that poetry is said to *do* rather than to *be*). Such a criticism, again, is objective and absolute, as distinguished from the relative criticism of idiom and period. I mean that this criticism will notice that Pope is different from Shakespeare, but will notice even more attentively that Shakespeare is different from Taylor the Water Poet and Pope different from Sir Richard Blackmore. Such a criticism will be interested to analyze the latter two differences and see what these differences have in common and what Shakespeare and Pope have in common, and it will not despair of describing that similarity (that formula or character of great poetry) even though the terms be abstract and difficult. Or, if we are told that there is no universal agreement about what is good - that Pope has not been steadily held in esteem, that Shakespeare has been considered a barbarian, the objective analyst of structures can at least say (and it seems much to say) that he is describing a class of poems, those which through a peculiar complexity possess unity and maturity and in a special way can be called both individual and universal. Among all recorded "poems," this class is of a relative rarity, and further this class will be found in an impressive way to coincide with those poems which have by some body of critics, some age of educated readers, been called great.

The function of the objective critic is by approximate descriptions of poems, or multiple restatements of their meaning, to aid other readers to come to an intuitive

and full realization of poems themselves and hence to know good poems and distinguish them from bad ones. It is of course impossible to tell all about a poem in other words. Croce tells us, as we should expect him to, of the "impossibility of ever rendering in logical terms the full effect of any poetry or of other artistic work." "Criticism, nevertheless," he tells us, "performs its own office, which is to discern and to point out exactly where lies the poetical motive and to formulate the divisions which aid in distinguishing what is proper to every work." The situation is something like this: In each poem there is something (an individual intuition - or a concept) which can never be expressed in other terms. It is like the square root of two or like pi, which cannot be expressed by rational numbers, but only as their *limit*. Criticism of poetry is like 1.414... or 3.1416 ..., not all it would be, yet all that can be had and very useful.

Structuralism, Linguistics, Narratology

Introduction: The Implied Order: Structuralism

Julie Rivkin and Michael Ryan

Structuralism begins with the work of Ferdinand de Saussure, an early twentieth-century Swiss linguist who argued that language should be studied as if it were frozen in time and cut transversely like a leaf. What results is a vision of the entire language system as it exists in implied or unconscious fashion in any spoken utterance. Utterances are merely the manifestation of the rules of the system that lend order to the heterogeneity of language. This notion of an implied order is central to the Structuralist undertaking, as it spreads out from linguistics to anthropology and philosophy and to literary criticism through the course of the twentieth century.

Structuralism derives both historically and logically from Formalism. Roman Jakobson, one of the original Formalists, was also, by virtue of emigration, one of the first major influences on French Structuralism, which flourished from the 1950s through the 1960s. The scientific impulse evident in Formalism also finds its fulfillment in the Structuralist emphasis on the task of adducing the internal system or order of linguistic, cultural, and literary phenomena.

From Jakobson, early Structuralists such as anthropologist Claude Levi-Strauss learned of Saussure's ideas about language. Levi-Strauss began to see that culture, like language, is a system characterized by an internal order of interconnected parts that obey certain rules of operation. A structure is both like a skeleton and like a genetic code in that it is the principle of stability and coherence in any cultural system, while also being the principle of action that allows the culture to exist in time as a living thing. After meeting Jakobson in New York during their mutual exile during World War II, Levi-Strauss began to think about culture as a form of communication like language. What was communicated between cultural participants were tokens, like words, that enacted and reproduced the basic assumptions and rules of the culture. In his analysis of kinship systems, *Elementary Structures of Kinship* (1949), Levi-Strauss argued that primitive cultures maintain peace between social groups by using women as tokens in marriage. Such inter-familial and intertribal marriages function as a form of communication and create personal or family relations that work to diminish the possibility of conflict. Levi-Strauss went on to conduct famous studies of myths that noticed, in the same manner as Russian critic Vladimir Propp's path-breaking work on folk tales, that such myths, despite their heterogeneity and multiplicity, told the same kernel narratives. Those narratives tended to work to resolve contradictions in the culture, such as that between a conception of humans as plant-growing and peaceful and humans as hunters and

warriors. The many versions of the Oedipus myth, for example, all tell a story about the conflict between the idea that humans emerge from the earth ("Oedipus" means lame in the foot) and the idea that they are born from other humans (hence the sanctity of the incest taboo). The tale's function is to provide a mediation to the contradiction between nature (sexuality) and culture (rule against incest) by forbidding natural sex between family members.

The second major contribution that Saussure made to Structuralism was his conception of the linguistic sign. Words, he noted, are signs, and linguistics rightly belongs to another discipline called semiology, which would study the way signs, including words, operate. Words are signs in that they consist of two faces or sides -the signifier, which is the phonic component, and the signified, which is the ideational component. A word is both a sound and an idea or image of its referent. Alongside and often in conjunction with the Structural anthropology of Levi-Strauss, there developed in France in the 1950s, especially in the work of Roland Barthes, a concern with the study of the semiological dimension of literature and culture. A work of literature, Barthes noted, is, after all, nothing but an assemblage of signs that function in certain ways to create meaning. In studying culture, Barthes noticed that films, commodities, events, and images are lent meaning by their association with certain signs. Barthes went on in the 1960s to become one of the major practitioners of semiological analysis in literature. His most important books are *Writing Degree Zero* (1953), *Mythologies* (1957), *On Racine* (1963), *Critical Essays* (1964), *Elements of Semiology* (1965), and *S/Z* (1970).

A direct link between French Structuralism and Russian Formalism was established in 1965 with the publication of Tzvetan Todorov's collected translations of the Formalists' *Theory of Literature*. Todorov's work is associated most often with the study of narrative, and he helped formulate the Structuralist conception of narrative as the common element of organization among diverse examples. In his study of Henry James's tales, for example ("The Structural Analysis of Narrative" in *Poetics of Prose* [1971]), he contends that they all revolve around a missing center, a point of desire that is sought but that never appears. The study of narrative (or narratology, as it is also called) is one of the most abiding strands of Structuralist thinking.

By the mid-1960s, Structuralism was the dominant school of thought in French intellectual life, and its influence is evident in the work of historian Michel Foucault, psychoanalyst Jacques Lacan, literary critic Julia Kristeva, and philosopher Louis Althusser. Foucault's work at that time included *The Order of Things: An Archeology of the Human Sciences* (*Les Mots et les choses*, 1966), *The Archeology of Knowledge* (1969), and *The Order of Discourse* (1970). Foucault is important for drawing attention to the role of language in the conceptual frameworks or "epistemes" that are used in different epochs for understanding the world. Words provide us with maps for assigning order to nature and to society. Foucault notices that what counts as knowledge changes with time, and with each change, the place of language in knowledge is also modified. In one era, the world is considered to be a site of analogies between levels, but in a later epoch, the world is broken down into discrete parts that are then organized into taxonomies.

Foucault is important as well for developing the idea of discourse and of discourse formation. A discursive formation is a coherent group of assumptions and language practices that applies to one region of knowledge, or expresses the beliefs of a social group, or articulates rules and ideals regarding kinds of behavior. Modern science is

a discursive formation in that it is characterized both by a list of discoveries and a body of knowledge, but also by recognized and widely accepted linguistic forms for describing the methods and findings of science. When we get to feminism, you will encounter feminists who speak of the "discourse of patriarchy," the set of ways of thinking and of practicing language that lend coherence to male rule in society. They also describe the discourse of advice books that educated women prior to the modern era in how to behave "properly" as women, that is, in how to be "chaste, silent, and obedient."

Foucault's work draws attention to the fact that many assumptions in a culture are maintained by language practices that comprise a common tool both for knowing the world and for constructing it. By construction here, we mean the translation of physical realities into discursive realities. The "dominant discourse" of the US, for example, is one that lends great privilege to the "freedom" of the individual. The physical reality of modern life is hemmed in and constrained in many complex ways, from laws that allow police to search automobiles without cause to an economic system that requires enormous amounts of time spent at the workplace under someone else's control. Nevertheless, this physical and institutional reality is rendered discursively in the American lexicon as "freedom." Just as all women were far from being chaste, silent, and obedient, despite what the dominant discourse of the advice or courtesy books mandated, so also most Americans have limited access to the kind of pure freedom the dominant term seems to imply. What Foucault noted was that the world we live in is shaped as much by language as by knowledge or perception. Indeed, according to him, knowledge and perception always occur through the mediation of language. We would not be able to know anything if we were not able to order the world linguistically in certain ways.

In his later work, Foucault explores the way sexuality is characterized over history in different discourses of the body (*History of Sexuality* [1976]). And he examines the change in regimes of social discipline from medieval times to modern times (*Discipline and Punish* [1975]).

[j" ll u i' M: U (.: The Linguistic Foundation

Jonathan Culler

Jonathan Culler's *Structuralist Poetics* (1975) was one of the first complete introductions in English to the French structuralist movement in literary criticism. In this selection, he proposes an analogy between the structuralist description of how language operates and the rules and conventions that make up human culture.

The notion that linguistics might be useful in studying other cultural phenomena is based on two fundamental insights: first, that social and cultural phenomena are not simply material objects or events but objects or events with meaning, and hence signs; and second, that they do not have essences but are defined by a network of relations, both internal and external. Stress may fall on one or the other of these propositions - it would be in these terms, for example, that one might try to distinguish semiology and structuralism - but in fact the two are inseparable, for in studying signs one must investigate the system of relations that enables meaning to be produced and, reciprocally, one can only determine what are the pertinent relations among items by considering them as signs.

Structuralism is thus based, in the first instance, on the realization that if human actions or productions have a meaning there must be an underlying system of distinctions and conventions which makes this meaning possible. Confronted with a marriage ceremony or a game of football, for example, an observer from a culture where these did not exist could present an objective description of the actions which took place, but he would be unable to grasp their meaning and so would not be treating them as social or cultural phenomena. The actions are meaningful only with respect to a set of institutional conventions. Wherever there are two posts one can kick a ball between them but one can score a goal only within a certain institutionalized framework. As Levi-Strauss says in his "Introduction a l'oeuvre de Marcel Mauss," "particular actions of individuals are never symbolic in themselves; they are the elements out of which is constructed a symbolic system, which must be collective" (p. xvi). The cultural meaning of any particular act or object is determined by a whole system of constitutive rules: rules which do not regulate behavior so much as create the possibility of particular forms of behavior. The rules of English enable sequences of sound to have meaning; they make it possible to utter grammatical or ungrammatical sentences. And analogously, various social rules make it possible to marry, to score a goal, to write a poem, to be impolite. It is in this sense that a culture is composed of a set of symbolic systems ____

To claim that cultural systems may with profit be treated as "languages" is to suggest that one will understand them better if one discusses them in terms provided

by linguistics and analyzes them according to procedures used by linguists. In fact, the range of concepts and methods which structuralists have found useful is fairly restricted and only some half-dozen linguists could qualify as seminal influences. The first, of course, is Ferdinand de Saussure, who waded into the heterogeneous mass of linguistic phenomena and, recognizing that progress would be possible only if one isolated a suitable object for study, distinguished between speech acts (*la parole*) and the system of a language (*la langue*). The latter is the proper object of linguistics. Following Saussure's example and concentrating on the system which underlies speech sounds, members of the Prague linguistic circle - particularly Jakobson and Trubetzkoy - effected what Levi-Strauss called the "phonological revolution" and provided what was to later structuralists the clearest model of linguistic method. Distinguishing between the study of actual speech sounds (phonetics) and the investigation of those aspects of sound that are functional in a particular language (phonology), Trubetzkoy argued that "phonology should investigate which phonic differences are linked, in the language under consideration, with differences of meaning, how these differentiating elements or marks are related to one another, and according to what rules they combine to form words and phrases" (*Principes de phonologie*, pp. 11-12). Phonology was important for structuralists because it showed the systematic nature of the most familiar phenomena, distinguished between the system and its realization and concentrated not on the substantive characteristics of individual phenomena but on abstract differential features which could be defined in relational terms....

The basic distinction on which modern linguistics rests, and which is equally crucial to the structuralist enterprise in other fields, is Saussure's isolation of *langue* from *parole*. The former is a system, an institution, a set of interpersonal rules and norms, while the latter comprises the actual manifestations of the system in speech and writing. It is, of course, easy to confuse the system with its manifestations, to think of English as the set of English utterances. But to learn English is not to memorize a set of utterances; it is to master a system of rules and norms which make it possible to produce and understand utterances. To know English is to have assimilated the system of the language. And the linguist's task is not to study utterances for their own sake; they are of interest to him only in so far as they provide evidence about the nature of the underlying system, the English language.

Within linguistics itself there are disagreements about what precisely belongs to *langue* and what to *parole*: whether, for example, an account of the linguistic system should specify the acoustic and articulatory features that distinguish one phoneme from another (/p/ is "voiceless" and /b/ "voiced"), or whether such features as "voiced" and "voiceless" should be thought of as the manifestations in *parole* of what, in *la langue* itself, is a purely formal and abstract distinction. Such debates need not concern the structuralist, except in so far as they indicate that structure can be defined at various levels of abstraction. What does concern him is a pair of distinctions which the differentiation of *langue* from *parole* is designed to cover between rule and behavior and between the functional and the nonfunctional.

The distinction between rule and behavior is crucial to any study concerned with the production or communication of meaning. In investigating physical events one may formulate laws which are nothing other than direct summaries of behavior, but in the case of social and cultural phenomena the rule is always at some distance from actual behavior and that gap is a space of potential meaning. The instituting of the simplest rule, such as "members of this club will not step on cracks in the

pavement," may in some cases determine behavior but indubitably determines meaning: the placing of one's feet on the pavement, which formerly had no meaning, now signifies either compliance with or deviation from the rule and hence an attitude towards the club and its authority. In social and cultural systems behavior may deviate frequently and considerably from the norm without impugning the existence of the norm. Many promises are in fact broken, but there still exists a rule in the system of moral concepts that promises should be kept; though of course if one never kept any promises doubts might arise as to whether one understood the institution of promising and had assimilated its rules.

Course in General Linguistics

Ferdinand de Saussure

Assembled by students from class notes and published in 1916, Ferdinand de Saussure's *Course in General Linguistics* quickly became one of the most influential books of the twentieth century. It inspired a wide range of work in anthropology, sociology, philosophy, and literary criticism that is usually referred to as Structuralism.

In separating language from speaking we are at the same time separating: (1) what is social from what is individual; and (2) what is essential from what is accessory and more or less accidental.

Language is not a function of the speaker; it is a product that is passively assimilated by the individual. It never requires premeditation, and reflection enters in only for the purpose of classification, which we shall take up later.

Speaking, on the contrary, is an individual act. It is willful and intellectual. Within the act, we should distinguish between: (1) the combinations by which the speaker uses the language code for expressing his own thought; and (2) the psychophysical mechanism that allows him to exteriorize those combinations.

To summarize, these are the characteristics of language:

(1) Language is a well-defined object in the heterogeneous mass of speech facts. It can be localized in the limited segment of the speaking-circuit where an auditory image becomes associated with a concept. It is the social side of speech, outside the individual who can never create nor modify it by himself; it exists only by virtue of a sort of contract signed by the members of a community. Moreover, the individual must always serve an apprenticeship in order to learn the functioning of language; a child assimilates it only gradually. It is such a distinct thing that a man deprived of the use of speaking retains it provided that he understands the vocal signs that he hears.

(2) Language, unlike speaking, is something that we can study separately. Although dead languages are no longer spoken, we can easily assimilate their linguistic organisms. We can dispense with the other elements of speech; indeed, the science of language is possible only if the other elements are excluded.

(3) Whereas speech is heterogeneous, language, as defined, is homogeneous. It is a system of signs in which the only essential thing is the union of meanings and sound-images, and in which both parts of the sign are psychological.

(4) Language is concrete, no less so than speaking; and this is a help in our study of it. Linguistic signs, though basically psychological, are not abstractions; associations which bear the stamp of collective approval - and which added together constitute language - are realities that have their seat in the brain.

We have just seen that language is a social institution; but several features set it apart from other political, legal, etc. institutions.

We must call in a new type of facts in order to illuminate the special nature of language.

Language is a system of signs that express ideas, and is therefore comparable to a system of writing, the alphabet of deaf-mutes, symbolic rites, polite formulas, military signals, etc. But it is the most important of all these systems.

A science that studies the life of signs within society is conceivable; it would be a part of social psychology and consequently of general psychology; I shall call it *semiology* (from Greek *semeion*, "sign"). Semiology would show what constitutes signs, what laws govern them. Since the science does not yet exist, no one can say what it would be; but it has a right to existence, a place started out in advance. Linguistics is only a part of the general science of semiology; the laws discovered by semiology will be applicable to linguistics, and the latter will circumscribe a well-defined area within the mass of anthropological facts...

Sign, Signified, Signifier

Some people regard language, when reduced to its elements, as a naming-process only - a list of words, each corresponding to the thing that it names. For example:

This conception is open to criticism at several points. It assumes that ready-made ideas exist before words...; it does not tell us whether a name is vocal or psychological

in nature (*arbor*, for instance, can be considered from either viewpoint); finally, it lets us assume that the linking of a name and a thing is a very simple operation - an assumption that is anything but true. But this rather naive approach can bring us near the truth by showing us that the linguistic unit is a double entity, one formed by the associating of two terms.

We have seen in considering the speaking-circuit that both terms involved in the linguistic sign are psychological and are united in the brain by an associative bond. This point must be emphasized. The linguistic sign unites, not a thing and a name, but a concept and a sound-image. The latter is not the material sound, a purely physical thing, but the psychological imprint of the sound, the impression that it makes on our senses. The sound-image is sensory, and if I happen to call it "material," it is only in that sense, and by way of opposing it to the other term of the association, the concept, which is generally more abstract.

The psychological character of our sound-images becomes apparent when we observe our own speech. Without moving our lips or tongue, we can talk to ourselves or recite mentally a selection of verse. Because we regard the words of our language as sound-images, we must avoid speaking of the "phonemes" that make up the words. This term, which suggests vocal activity, is applicable to the spoken word only, to the realization of the inner image in discourse. We can avoid that misunderstanding by speaking of the *sounds* and *syllables* of a word provided we remember that the names refer to the sound-image.

The linguistic sign is then a two-sided psychological entity that can be represented by the drawing:

Concept

Sound image

The two elements are intimately united, and each recalls the other. Whether we try to find the meaning of the Latin word *arbor* or the word that Latin uses to designate the concept "tree," it is clear that only the associations sanctioned by that language appear to us to conform to reality, and we disregard whatever others might be imagined.

Our definition of the linguistic sign poses an important question of terminology. I call the combination of a concept and a sound-image *a. sign*, but in current usage the term generally designates only a sound-image, a word, for example (*arbor*, etc.). One tends to forget that *arbor* is called a sign only because it carries the concept "tree," with the result that the idea of the sensory part implies the idea of the whole.

Ambiguity would disappear if the three notions involved here were designated by three names, each suggesting and opposing the others. I propose to retain the word *sign* [*signe*] to designate the whole and to replace *concept* and *sound-image* respectively by *signified* [*signifié*] and *signifier* [*signifiant*]; the last two terms have the advantage of indicating the opposition that separates them from each other and from the whole of which they are parts. As regards *sign*, if I am satisfied with it, this is simply because I do not know of any word to replace it, the ordinary language suggesting no other.

The linguistic sign, as defined, has two primordial characteristics. In enunciating them I am also positing the basic principles of any study of this type.

Principle I: The Arbitrary Nature of the Sign

The bond between the signifier and the signified is arbitrary. Since I mean by sign the whole that results from the associating of the signifier with the signified, I can simply say: *the linguistic sign is arbitrary*.

The idea of "sister" is not linked by any inner relationship to the succession of sounds *s-o-r* which serves as its signifier in French; that it could be represented equally by just any other sequence is proved by differences among languages and by the very existence of different languages: the signified "ox" has as its signifier *b-o-f* on one side of the border and *o-k-s* (*Ochs*) on the other.

No one disputes the principle of the arbitrary nature of the sign, but it is often easier to discover a truth than to assign to it its proper place. Principle I dominates all the linguistics of language; its consequences are numberless. It is true that not all of them are equally obvious at first glance; only after many detours does one discover them, and with them the primordial importance of the principle...

The word *arbitrary* also calls for comment. The term should not imply that the choice of the signifier is left entirely to the speaker (we shall see below that the individual does not have the power to change a sign in any way once it has become established in the linguistic community); I mean that it is unmotivated, i.e. arbitrary in that it actually has no natural connection with the signified.

In concluding let us consider two objections that might be raised to the establishment of Principle I:

1 *Onomatopoeia* might be used to prove that the choice of the signifier is not always arbitrary. But onomatopoeic formations are never organic elements of a linguistic system. Besides, their number is much smaller than is generally supposed. Words like French *fouet* "whip" or *glas* "knell" may strike certain ears with suggestive sonority, but to see that they have not always had this priority we need only examine their Latin forms (*fouet* is derived from *fag us* "beech-tree," *glas* from *classi-cum* "sound of a trumpet"). The quality of their present sounds, or rather the quality that is attributed to them, is a fortuitous result of phonetic evolution.

As for authentic onomatopoeic words (e.g. *glug-glug*, *tick-tock*, etc.), not only are they limited in number, but also they are chosen somewhat arbitrarily, for they are only approximate and more or less conventional imitations of certain sounds (cf. English *bow-mow* and French *oua-oua*). In addition, once these words have been introduced into the language, they are to a certain extent subject to the same evolution - phonetic, morphological, etc. - that other words undergo (cf. *pigeon*, ultimately from the vulgar Latin *pipio* derived in turn from an onomatopoeic formulation):

obvious proof that they lose something of their original character in order to assume that of the linguistic sign in general, which is unmotivated.

2 *Interjections*, closely related to onomatopoeia, can be attacked on the same grounds and come no closer to refuting our thesis. One is tempted to see in them spontaneous expressions of reality dictated, so to speak, by natural forces. But for most interjections we can show that there is no fixed bond between their signified and their signifier. We need only compare two languages on this point to see how much such expressions differ from one language to the next (e.g. the English equivalent of French *ate I* is *ouch!*). We know, moreover, that many interjections were once words with specific meanings (cf. French *diable!* "darn!" *mordieu!* "golly!" from *mort Dieu* "God's death," etc.).²

Onomatopoeic formations and interjections are of secondary importance, and their symbolic origin is in part open to dispute.

Principle II: The Linear Nature of the Signifier

The signifier, being auditory, is unfolded solely in time from which it gets the following characteristics: (a) it represents a span, and (b) the span is measurable in a single dimension; it is a line.

While Principle II is obvious, apparently linguists have always neglected to state it, doubtless because they found it too simple; nevertheless, it is fundamental, and its consequences are incalculable. Its importance equals that of Principle I; the whole mechanism of language depends upon it. In contrast to visual signifiers (nautical signals, etc.) which can offer simultaneous groupings in several dimensions, auditory signifiers have at their command only the dimension of time. Their elements are presented in succession; they form a chain. This feature becomes readily apparent when they are represented in writing and the spatial line of graphic marks is substituted for succession in time.

Sometimes the linear nature of the signifier is not obvious. When I accent a syllable, for instance, it seems that I am concentrating more than one significant element on the same point. But this is an illusion; the syllable and its accent constitute only one phonational act. There is no duality within the act but only different oppositions to what precedes and what follows ...

Certainly all sciences would profit by indicating more precisely the coordinates along which their subject matter is aligned. Everywhere distinctions should be made, according to the following illustration, between (1) *the axis of simultaneities* (AB), which stands for the relations of coexisting things and from which the intervention of time is excluded; and (2) *the axis of successions* (CD), on which only one thing can be considered at a time but upon which are located all the things on the first axis together with their changes.

... [T]o indicate more clearly the opposition and crossing of two orders of phenomena that relate to the same object, I prefer to speak of *synchronic* and *diachronic* linguistics. Everything that relates to the static side of our science is synchronic; everything that has to do with evolution is diachronic. Similarly, *synchrony* and *diachrony* designate respectively a language-state and an evolutionary phase....

The Difference between the Two Classes Illustrated by Comparisons

To show both the autonomy and the interdependence of synchrony we can compare the first to the projection of an object on a plane surface. Any projection depends directly on the nature of the object projected, yet differs from it - the object itself is a thing apart. Otherwise there would not be a whole science of projections; considering the bodies themselves would suffice. In linguistics there is the same relationship between the historical facts and a language-state, which is like a projection of the facts at a particular moment. We do not learn about synchronic states by studying bodies, i.e. diachronic events, any more than we can learn about geometric projections by studying, even carefully, the different types of bodies.

Similarly if the stem of a plant is cut transversely, a rather complicated design is formed by the cut surface; the design is simply one perspective of the longitudinal fibers, and we would be able to see them on making a second cut perpendicular to the first. Here again one perspective depends on the other; the longitudinal cut shows the fibers that constitute the plant, and the transversal cut shows their arrangement on a particular plane; but the second is distinct from the first because it brings out certain relations between the fibers - relations that we could never grasp by viewing the longitudinal plane.

But of all comparisons that might be imagined, the most fruitful is the one that might be drawn between the functioning of language and a game of chess. In both instances we are confronted with a system of values and their observable modifications. A game of chess is like an artificial realization of what language offers in a natural form.

Let us examine the matter more carefully.

First, a state of the set of chessmen corresponds closely to a state of language. The respective value of the pieces depends on their position on the chessboard just as each linguistic term derives its value from its opposition to all the other terms.

In the second place, the system is always momentary; it varies from one position to the next. It is also true that values depend above all else on an unchangeable convention, the set of rules that exists before a game begins and persists after each move. Rules that are agreed upon once and for all exist in language too; they are the constant principles of semiology.

Finally, to pass from one state of equilibrium to the next, or - according to our terminology - from one synchrony to the next, only one chesspiece has to be moved; there is no general rummage. Here we have the counterpart of the diachronic phenomenon with all its peculiarities. In fact:

- (a) In each play only one chesspiece is moved; in the same way in language, changes affect only isolated elements.
- (b) In spite of that, the move has a repercussion on the whole system; it is impossible for the player to foresee exactly the extent of the effect. Resulting changes of value will be, according to the circumstances, either nil, very serious, or of average importance.
- (c) In chess, each move is absolutely distinct from the preceding and the subsequent equilibrium. The change effected belongs to neither state: only states matter.

In a game of chess any particular position has the unique characteristic of being freed from all antecedent positions; the route used in arriving there makes absolutely no difference; one who has followed the entire match has no advantage over the curious party who comes up at a critical moment to inspect the state of the game; to describe this arrangement, it is perfectly useless to recall what had just happened ten seconds previously. All this is equally applicable to language and sharpens the radical distinction between diachrony and synchrony. Speaking operates only on a language-state, and the changes that intervene between states have no place in either state.

At only one point is the comparison weak: the chessplayer *intends* to bring about a shift and thereby to exert an action on the system, whereas language premeditates nothing. The pieces of language are shifted - or rather modified - spontaneously and fortuitously. The umlaut of *Hande* for *hanti* and *Gdste* for *gasti* produced a new system for forming the plural but also gave rise to verbal forms like *tragt* from *tragit*, etc. In order to make the game of chess seem at every point like the functioning of language, we would have to imagine an unconscious or unintelligent player. This sole difference, however, makes the comparison even more instructive by showing the absolute necessity of making a distinction between the two classes of phenomena in linguistics. For if diachronic facts cannot be reduced to the synchronic system which they condition when the change is unintentional, all the more will they resist when they set a blind force against the organization of a system of signs....

Linguistic Value from a Conceptual Viewpoint

When we speak of the value of a word, we generally think first of its property of standing for an idea, and this is in fact one side of linguistic value. But if this is true, how does *value* differ from *signification*? Might the two words be synonyms? I think not, although it is easy to confuse them, since the confusion results not so much from their similarity as from the subtlety of the distinction that they mark.

From a conceptual viewpoint, value is doubtless one element in signification, and it is difficult to see how signification can be dependent upon value and still be distinct from it. But we must clear up the issue or risk reducing language to a simple naming-process.

Let us first take signification as it is generally understood and as it was pictured on page 61. As the arrows in the drawing show, it is only the counterpart of the sound-image. Everything that occurs concerns only the sound-image and the concept when we look upon the word as independent and self-contained.

Signified

Signifier

But here is the paradox: on the one hand the concept seems to be the counterpart of the sound-image, and on the other hand the sign itself is in turn the counterpart of the other signs of language.

Language is a system of interdependent terms in which the value of each term results solely from the simultaneous presence of the others, as in the diagram:

How, then, can value be confused with signification, i.e. the counterpart of the sound-image? It seems impossible to liken the relations represented here by horizontal arrows to those represented above by vertical arrows. Putting it another way and again taking up the example of the sheet of paper that is cut in two, it is clear that the observable relation between the different pieces A, B, C, D, etc. is distinct from the relation between the front and back of the same piece as in A/A', B/B', etc.

To resolve the issue, let us observe from the outset that even outside language all values are apparently governed by the same paradoxical principle. They are always composed:

- (1) of a *dissimilar* thing that can be *exchanged* for the thing of which the value is to be determined; and
- (2) of *similar* things that can be *compared* with the thing of which the value is to be determined.

Both factors are necessary for the existence of a value. To determine what a five-franc piece is worth one must therefore know: (1) that it can be exchanged for a fixed quantity of a different thing, e.g. bread; and (2) that it can be compared with a similar value of the same system, e.g. a one-franc piece, or with coins of another system (a dollar, etc.). In the same way a word can be exchanged for something dissimilar, an idea; besides, it can be compared with something of the same nature, another word. Its value is therefore not fixed so long as one simply states that it can be "exchanged" for a given concept, i.e. that it has this or that signification: one

must also compare it with similar values, with other words that stand in opposition to it. Its content is really fixed only by the concurrence of everything that exists outside it. Being part of a system, it is endowed not only with a signification but also and especially with a value, and this is something quite different.

A few examples will show clearly that this is true. Modern French *mouton* can have the same signification as English *sheep* but not the same value, and this for several reasons, particularly because in speaking of a piece of meat ready to be served on the table, English uses *mutton* and not *sheep*. The difference in value between *sheep* and *mouton* is due to the fact that *sheep* has beside it a second term while the French word does not.

Within the same language, all words used to express related ideas limit each other reciprocally; synonyms like French *redouter* "dread," *craindre* "fear," and *avoir peur* "be afraid" have value only through their opposition: if *redouter* did not exist, all its content would go to its competitors. Conversely, some words are enriched through contact with others: e.g. the new element introduced in *decrepit* (un vieillard *decrepit*) results from the coexistence of *decrepi* (un mur *decrepi*). The value of just any term is accordingly determined by its environment; it is impossible to fix even the value of the word signifying "sun" without first considering its surroundings: in some languages it is not possible to say "sit in the *sun*?"

Everything said about words applies to any term of language, e.g. to grammatical entities. The value of a French plural does not coincide with that of a Sanskrit plural even though their signification is usually identical; Sanskrit has three numbers instead of two (*my eyes, my ears, my arms, my legs*, etc. are dual); it would be wrong to attribute the same value to the plural in Sanskrit and in French; its value clearly depends on what is outside and around it.

If words stood for pre-existing concepts, they would all have exact equivalents in meaning from one language to the next; but this is not true. French uses *louer* (*une maison*) "let (a house)" indifferently to mean both "pay for" and "receive payment for," whereas German uses two words, *mieten* and *vermieten*; there is obviously no exact correspondence of values. The German verbs *schätzen* and *urteilen* share a number of significations, but that correspondence does not hold at several points.

Inflection offers some particularly striking examples. Distinctions of time, which are so familiar to us, are unknown in certain languages. Hebrew does not recognize even the fundamental distinctions between the past, present, and future. Proto-Germanic has no special form for the future; to say that the future is expressed by the present is wrong, for the value of the present is not the same in Germanic as in languages that have a future along with the present. The Slavic languages regularly single out two aspects of the verb: the perfective represents action as a point, complete in its totality; the imperfective represents it as taking place, and on the line of time. The categories are difficult for a Frenchman to understand, for they are unknown in French; if they were predetermined, this would not be true. Instead of preexisting ideas then, we find in all the foregoing examples *values* emanating from the system. When they are said to correspond to concepts, it is understood that the concepts are purely differential and defined not by their positive content but negatively by their relations with the other terms of the system. Their most precise characteristic is in being what the others are not.

Now the real interpretation of the diagram of the signal becomes apparent. Thus means that in French the concept "to judge" is linked to the sound-image *juger*; in

short, it symbolizes signification. But it is quite clear that initially the concept is nothing, that is only a value determined by its relations with other similar values, and that without them the signification would not exist. If I state simply that a word signifies something when I have in mind the associating of a sound-image with a concept, I am making a statement that may suggest what actually happens, but by no means am I expressing the linguistic fact in its essence and fullness.

Linguistic Value from a Material Viewpoint

The conceptual side of value is made up solely of relations and differences with respect to the other terms of language, and the same can be said of its material side. The important thing in the word is not the sound alone but the phonic differences that make it possible to distinguish this word from all others, for differences carry signification.

This may seem surprising, but how indeed could the reverse be possible? Since one vocal image is no better suited than the next for what it is commissioned to express, it is evident, even *a priori* that a segment of language can never in the final analysis be based on anything except its noncoincidence with the rest. *Arbitrary* and *differential* are two correlative qualities.

The alteration of linguistic signs clearly illustrates this. It is precisely because the terms *a* and *b*, as such, are radically incapable of reaching the level of consciousness - one is always conscious of only the *a/b* difference - that each term is free to change according to laws that are unrelated to its signifying function. No positive sign characterizes the genitive plural in Czech *zen*; still the two forms *zena*: *zen* function as well as the earlier forms *zena*: *zenb*; *zen* has value only because it is different.

Here is another example that shows even more clearly the systematic role of phonic differences: in Greek, *ephen* is an imperfect and *esten* an aorist although both words are formed in the same way; the first belongs to the system of the present indicative of *phemi* "I say," whereas there is no present *stemi*; now it is precisely the relation *phemi*: *ephen* that corresponds to the relation between the present and the imperfect (cf. *deiknumi*: *edeiknun*, etc.). Signs function, then, not through their intrinsic value but through their relative position.

In addition, it is impossible for sound alone, a material element, to belong to language. It is only a secondary thing, substance to be put to use. All our conventional values have the characteristic of not being confused with the tangible element which supports them. For instance, it is not the metal in a piece of money that fixes its value. A coin nominally worth five francs may contain less than half its worth of silver. Its value will vary according to the amount stamped upon it and according to its use inside or outside a political boundary. This is even more true of the

linguistic signifier, which is not phonic but incorporeal - constituted not by its material substance but by the differences that separate its sound-image from all others.

The foregoing principle is so basic that it applies to all the material elements of language, including phonemes. Every language forms its words on the basis of a system of sonorous elements, each element being a clearly delimited unit and one of a fixed number of units. Phonemes are characterized not, as one might think, by their own positive quality but simply by the fact that they are distinct. Phonemes are above all else opposing, relative, and negative entities.

Proof of this is the latitude that speakers have between points of convergence in the pronunciation of distinct sounds. In French, for instance, general use of a dorsal *r* does not prevent many speakers from using a tongue-tip trill; language is not in the least disturbed by it; language requires only that the sound be different and not, as one might imagine, that it have an invariable quality. I can even pronounce the French *r* like German *ch* in *Bach*, *dock*, etc., but in German I could not use *r* instead of *ch*, for German gives recognition to both elements and must keep them apart. Similarly, in Russian there is no latitude for *t* in the direction of *f* (palatalized ?), for the result would be the confusing of two sounds differentiated by the language (cf. *govorif* "speak" and *govorit* "he speaks"), but more freedom may be taken with respect to *th* (aspirated *t*) since this sound does not figure in the Russian system of phonemes.

Since an identical state of affairs is observable in writing, another system of signs, we shall use writing to draw some comparisons that will clarify the whole issue. In fact:

- 1 The signs used in writing are arbitrary; there is no connection, for example, between the letter *t* and the sound that it designates.
- 2 The value of letters is purely negative and differential. The same person can write *t* for instance, in different ways:

The only requirement is that the sign for *t* not be confused in his script with the signs used for *l*, *d*, etc.

- 3 Values in writing function only through reciprocal opposition within a fixed system that consists of a set number of letters. This third characteristic, though not identical to the second, is closely related to it, for both depend on the first. Since the graphic sign is arbitrary, its form matters little or rather matters only within the limitations imposed by the system.
- 4 The means by which the sign is produced is completely unimportant, for it does not affect the system (this also follows from characteristic 1). Whether I make the letters in white or black, raised or engraved, with pen or chisel - all this is of no importance with respect to their signification.

The Sign Considered in Its Totality

Everything that has been said up to this point boils down to this: in language there are only differences. Even more important: a difference generally implies positive terms between which the difference is set up; but in language there are only differences *without positive terms*. Whether we take the signified or the signifier, language has neither ideas nor sounds that existed before the linguistic system, but only conceptual and phonic differences that have issued from the system. The idea or phonic substance that a sign contains is of less importance than the other signs that surround it. Proof of this is that the value of a term may be modified without either its meaning or its sound being affected, solely because a neighboring term has been modified.

But the statement that everything in language is negative is true only if the signified and the signifier are considered separately; when we consider the sign in its totality, we have something that is positive in its own class. A linguistic system is a series of differences of sound combined with a series of differences of ideas; but the pairing of a certain number of acoustical signs with as many cuts made from the mass of thought engenders a system of values; and this system serves as the effective link between the phonic and psychological elements within each sign. Although both the signified and the signifier are purely differential and negative when considered separately, their combination is a positive fact; it is even the sole type of facts that language has, for maintaining the parallelism between the two classes of differences is the distinctive function of the linguistic institution.

Certain diachronic facts are typical in this respect. Take the countless instances where alteration of the signifier occasions a conceptual change and where it is obvious that the sum of the ideas distinguished corresponds in principle to the sum of the distinctive signs. When two words are confused through phonetic alteration (e.g. French *decrepit* from *decrepitus* and *decrepi* from *crispus*), the ideas they express will also tend to become confused if only they have something in common. Or a word may have different forms (cf. *chaise* "chair" and *chaire* "desk"). Any nascent difference will tend invariably to become significant but without always succeeding or being successful on the first trial. Conversely, any conceptual difference perceived by the mind seeks to find expression through a distinct signifier, and two ideas that are no longer distinct in the mind tend to merge into the same signifier.

When we compare signs - positive terms - with each other, we can no longer speak of difference; the expression would not be fitting, for it applies only to the comparing of two sound-images, e.g. *father* and *mother*; or two ideas, e.g. the idea "father" and the idea "mother"; two signs, each having a signified and signifier, are not different but only distinct. Between them there is only *opposition*. The entire mechanism of language, with which we shall be concerned later, is based on oppositions of this kind and on the phonic and conceptual differences that they imply.

What is true of value is true also of the unit. A unit is a segment of the spoken chain that corresponds to a certain concept; both are by nature purely differential.

Applied to units, the principle of differentiation can be stated in this way: *the characteristics of the unit blend with the unit itself*. In language, as in any semiological system, whatever distinguishes one sign from the others constitutes it. Difference makes character just as it makes value and the unit.

Another rather paradoxical consequence of the same principle is this: in the last analysis what is commonly referred to as a "grammatical fact" fits the definition of the unit, for it always expresses an opposition of terms; it differs only in that the opposition is particularly significant (e.g. the formation of German plurals of the type *Nacht: Nachte*). Each term present in the grammatical fact (the singular without umlaut or final *-e* in opposition to the plural with umlaut and *-e*) consists of the interplay of a number of oppositions within the system. When isolated, neither *Nacht* nor *Nachte* is anything: thus everything is opposition. Putting it another way, the *Nacht: Nachte* relation can be expressed by an algebraic formula a/b in which a and b are not simple terms but result from a set of relations. Language, in a manner of speaking, is a type of algebra consisting solely of complex terms. Some of its oppositions are more significant than others; but units and grammatical facts are only different names for designating diverse aspects of the same general fact: the functioning of linguistic oppositions. This statement is so true that we might very well approach the problem of units by starting from grammatical facts. Taking an opposition like *Nacht: Nachte*, we might ask what are the units involved in it. Are they only the two words, the whole series of similar words, a and $a\lambda$ or all singulars and plurals, etc.?

Units and grammatical facts would not be confused if linguistic signs were made up of something besides differences. But language being what it is, we shall find nothing simple in it regardless of our approach; everywhere and always there is the same complex equilibrium of terms that mutually condition each other. Putting it another way, *language is form and not a substance*. This truth could not be over-stressed, for all the mistakes in our terminology, all our incorrect ways of naming things that pertain to language, stem from the involuntary supposition that the linguistic phenomenon must have substance.

Notes .

- 1 The term sound-image may seem to be too restricted inasmuch as beside the representation of the sounds of a word there is also that of its articulation, the muscular image of the phonational act. But for F. de Saussure, language is essentially a depository, a thing received from without. The sound-image is par excellence the natural representation of the word as a fact of potential language, outside any actual use of it in speaking. The motor side is thus implied or, in any event, occupies only a subordinate role with respect to the sound-image. [Ed.]
- 2 Cf. English *goodness!* and *zounds!* (from *God's wounds*). [Trans.]
- 3 The use of the comparative form for two and the superlative for more than two in English (e.g. may the *better* boxer win: the *best* boxer in the world) is probably a remnant of the old distinction between the dual and the plural number. [Trans.]

Morphology of the Folk-tale

Vladimir Propp

Though not a member of either Russian Formalist group, Vladimir Propp wrote within the same intellectual current that sought to make literary study more scientific. His *Morphology of the Folk-Tale* (1927) in its very title suggests the scientific character of his undertaking. Propp is one of the first Structuralists in that he sought to delineate the innate order that existed in a disparate body of texts. Like a scientist searching for the one law that binds a number of different, physically distinct phenomena together and accounts for their similarities, Propp studied hundreds of Russian folk-tales or oral stories and came to the conclusion that they all followed the same pattern. This inner structure of the various tales constitutes its morphology.

Let us first of all attempt to formulate our task. As already stated in the foreword, this work is dedicated to the study of *fairy* tales. The existence of fairy tales as a special class is assumed as an essential working hypothesis. By "fairy tales" are meant at present those tales classified by Aarne under numbers 300 to 749. This definition is artificial, but the occasion will subsequently arise to give a more precise determination on the basis of resultant conclusions. We are undertaking a comparison of the themes of these tales. For the sake of comparison we shall separate the component parts of fairy tales by special methods; and then, we shall make a comparison of tales according to their components. The result will be a morphology (i.e., a description of the tale according to its component parts and the relationship of these components to each other and to the whole).

What methods can achieve an accurate description of the tale? Let us compare the following events:

- 1 A tsar gives an eagle to a hero. The eagle carries the hero away to another kingdom.
- 2 An old man gives Suenko a horse. The horse carries Suenko away to another kingdom.
- 3 A sorcerer gives Ivan a little boat. The boat takes Ivan to another kingdom.
- 4 A princess gives Ivan a ring. Young men appearing from out of the ring carry Ivan away into another kingdom, and so forth.

Both constants and variables are present in the preceding instances. The names of the *dramatis personae* change (as well as the attributes of each), but neither their actions nor functions change. From this we can draw the inference that a tale often attributes identical actions to various personages. This makes possible the study of the tale *according to the functions of its dramatis personae*.

We shall have to determine to what extent these functions actually represent recurrent constants of the tale. The formulation of all other questions will depend upon the solution of this primary question: how many functions are known to the tale?

Investigation will reveal that the recurrence of functions is astounding. Thus Baba Jaga, Morozko, the bear, the forest spirit, and the mare's head test and reward the stepdaughter. Going further, it is possible to establish that characters of a tale, however varied they may be, often perform the same actions. The actual means of the realization of functions can vary, and as such, it is a variable. Morozko behaves differently than Baba Jaga. But the function, as such, is a constant. The question of *what* a tale's dramatis personae do is an important one for the study of the tale, but the questions of *who* does it and *how* it is done already fall within the province of accessory study. The functions of characters are those components which could replace Veselovskij's "motifs," or Bedier's "elements." We are aware of the fact that the repetition of functions by various characters was long ago observed in myths and beliefs by historians of religion, but it was not observed by historians of the tale (cf. Wundt and Negelein). Just as the characteristics and functions of deities are transferred from one to another, and, finally, are even carried over to Christian saints, the functions of certain tale personages are likewise transferred to other personages. Running ahead, one may say that the number of functions is extremely small, whereas the number of personages is extremely large. This explains the twofold quality of a tale: its amazing multiformity, picturesqueness, and color, and on the other hand, its no less striking uniformity, its repetition.

Thus the functions of the dramatis personae are basic components of the tale, and we must first of all extract them. In order to extract the functions we must define them. Definition must proceed from two points of view. First of all, definition should in no case depend on the personage who carries out the function. Definition of a function will most often be given in the form of a noun expressing an action (interdiction, interrogation, flight, etc.). Secondly, an action cannot be defined apart from its place in the course of narration. The meaning which a given function has in the course of action must be considered. For example, if Ivan marries a tsar's daughter, this is something entirely different than the marriage of a father to a widow with two daughters. A second example: if, in one instance, a hero receives money from his father in the form of 100 rubles and subsequently buys a wise cat with this money, whereas in a second case, the hero is rewarded with a sum of money for an accomplished act of bravery (at which point the tale ends), we have before us two morphologically different elements - in spite of the identical action (the transference of money) in both cases. Thus, identical acts can have different meanings, and vice versa. *Function is understood as an act of a character, defined from the point of view of its significance for the course of the action.*

The observations cited may be briefly formulated in the following manner:

- 1 *Functions of characters serve as stable, constant elements in a tale, independent of how and by whom they are fulfilled. They constitute the fundamental components of a tale.*
- 2 *The number of functions known to the fairy tale is limited.*

If functions are delineated, a second question arises: in what classification and in what sequence are these functions encountered?

A word, first, about sequence. The opinion exists that this sequence is accidental. Veselovskij writes, "The selection and *order* of tasks and encounters (examples of motifs) already presupposes a certain *freedom*." Sklovskij stated this idea in even sharper terms: "It is quite impossible to understand why, in the act of adoption, the *accidental* sequence [Sklovskij's italics] of motifs must be retained. In the testimony of witnesses, it is precisely the sequence of events which is distorted most of all." This reference to the evidence of witnesses is unconvincing. If witnesses distort the sequence of events, their narration is meaningless. The sequence of events has its own laws. The short story too has similar laws, as do organic formations. Theft cannot take place before the door is forced. Insofar as the tale is concerned, it has its own entirely particular and specific laws. The sequence of elements, as we shall see later on, is strictly *uniform*. Freedom within this sequence is restricted by very narrow limits which can be exactly formulated. We thus obtain the third basic thesis of this work, subject to further development and verification:

- 3 *The sequence of functions is always identical...*
- 4 *All fairy tales are of one type in regard to their structure...*

The Functions of Dramatis Personae

[W]e shall enumerate the functions of the *dramatis personae* in the order dictated by the tale itself...

A tale usually begins with some sort of initial situation...

After the initial situation there follow functions:

I ONE OF THE MEMBERS OF A FAMILY ABSENTS HIMSELF FROM HOME. (Definition: *absentation*. Designation: B.)

Usual forms of absentation: going to work, to the forest, to trade, to war, "on business."

II AN INTERDICTION IS ADDRESSED TO THE HERO. (Definition: *interdiction*. Designation: y.)

1 (yl) "You dare not look into this closet" (159). "Take care of your little brother, do not venture forth from the courtyard" (113). "If Baba Jaga comes, don't you say anything, be silent" (106). "Often did the prince try to persuade her and command her not to leave the lofty tower," etc. (265)...

III THE INTERDICTION IS VIOLATED. (Definition: *violation*. Designation: a.)

The forms of violation correspond to the forms of interdiction... (the tsar's daughters go into the garden [B3]; they are *late* in returning home)...

At this point a new personage, who can be termed the *villain*, enters the tale. His role is to disturb the peace of a happy family, to cause some form of misfortune, damage, or harm. The villain(s) may be a dragon, a devil, bandits, a witch, or a stepmother, etc....

IV THE VILLAIN MAKES AN ATTEMPT AT RECONNAISSANCE. (Definition: *reconnaissance*. Designation: E.)

1 *The reconnaissance has the aim of finding out the location of children, or sometimes of precious objects, etc.* (E1). A bear says: "Who will tell me what has become of the tsar's children? Where did they disappear to?" (201); a clerk: "Where do you get these precious stones?" ...

V THE VILLAIN RECEIVES INFORMATION ABOUT HIS VICTIM. (Definition: *de livery*. Designation: t.)

1 *The villain directly receives an answer to his question* (41). The chisel answers the bear: "Take me out into the courtyard and throw me to the ground; where I stick, there's the hive." To the clerk's question about the precious stones, the merchant's wife replies: "Oh, the hen lays them for us," etc-----

VI THE VILLAIN ATTEMPTS TO DECEIVE HIS VICTIM IN ORDER TO TAKE POSSESSION OF HIM OR OF HIS BELONGINGS. (Definition: *trickery*. Designation: n.)

The villain, first of all, assumes a disguise. A dragon turns into a golden goat (n1) or a handsome youth (204); a witch pretends to be a "sweet old lady" (2G5) and imitates a mother's voice (108); a priest dresses himself in a goat's hide (258); a thief pretends to be a beggarwoman (189); then follows the function itself.

1 *The villain uses persuasion* (n1). A witch tries to have a ring accepted (114); a godmother suggests the taking of a steam bath (187); a witch suggests the removal of clothes (264) and bathing in a pond (265); a beggar seeks alms (189).³

Notes

- 1 See Afanas'ev, Nos 171, 139, 138, 156.
- 2 W. Wundt, "Mythus und Religion," *Volkerpsychologie* 11, Section 1; Negelein, *Germanische Mythologie*. Negelein creates an exceptionally apt term, *Depossedierte Gottheiten*.
- 3 The rest of Propp's functions are: (7) The victim unknowingly helps the villain by being deceived or influenced by the villain. (8) The villain harms a member of the family or a member of the family lacks or desires something. (9) This lack or misfortune is made known; the hero is given a request or a command, and he goes or is sent on a mission/quest. (10) The seeker (often the hero) plans action against the villain. (11) The hero leaves home. (12) The hero is tested, attacked, interrogated, and receives either a magical agent or a helper. (13) The hero reacts to the actions of the future donor. (14) The hero uses the magical agent. (15) The hero is transferred to the general location of the object of his mission/quest. (16) The hero and villain join in direct combat. (17) The hero is branded. (18) The villain is defeated. (19) The initial misfortune or lack is set right. (20) The hero returns home. (21) The hero is pursued. (22) The hero is rescued from pursuit. (23) The hero arrives home or elsewhere and is not recognized. (24) A false hero makes false claims. (25) A difficult task is set for the hero. (26) The task is accomplished. (27) The hero is recognized. (28) The false hero/villain is exposed. (29) The false hero is transformed. (30) The villain is punished. (31) The hero is married and crowned. (Thanks to John Fiske for this summary.)

Two Aspects of Language

Roman Jakobson

Roman Jakobson helped found the Moscow Linguistic Circle, and he worked with Viktor Shklovsky at the Society for the Study of Poetic Language. After emigrating from Russia in 1920, he worked in Prague with the Prague Linguistic Circle. Eventually, he made his way to the US, where he helped inspire Claude Levi-Strauss, another European exile driven from home by the Nazis, to invent Structuralist Anthropology, an attempt to merge linguistic theory and anthropological analysis. Jakobson, along with N. S. Troubetzkoy, contributed to the "phonological revolution," the insight that words are generated from differences between distinctive features such as voiced and unvoiced or aspirated and non-aspirated sounds. This selection was first published in 1956.

The varieties of aphasia are numerous and diverse, but all of them oscillate between the two polar types just described. Every form of aphasic disturbance consists in some impairment, more or less severe, either of the faculty for selection and substitution or for combination and contexture. The former affliction involves a deterioration of metalinguistic operations, while the latter damages the capacity for maintaining the hierarchy of linguistic units. The relation of similarity is suppressed in the former, the relation of contiguity in the latter type of aphasia. Metaphor is alien to the similarity disorder, and metonymy to the contiguity disorder.

The development of a discourse may take place along two different semantic lines: one topic may lead to another either through their similarity or through their contiguity. The metaphoric way would be the most appropriate term for the first case and the metonymic way for the second, since they find their most condensed expression in metaphor and metonymy respectively. In aphasia one or the other of these two processes is restricted or totally blocked - an effect which makes the study of aphasia particularly illuminating for the linguist. In normal verbal behavior both processes are continually operative, but careful observation will reveal that under the influence of a cultural pattern, personality, and verbal style, preference is given to one of the two processes over the other.

In a well-known psychological test, children are confronted with some noun and told to utter the first verbal response that comes into their heads. In this experiment two opposite linguistic predilections are invariably exhibited: the response is intended either as a substitute for, or as a complement to the stimulus. In the latter case the stimulus and the response together form a proper syntactic construction, most usually a sentence. These two types of reaction have been labeled substitutive and predicative.

To the stimulus *hut* one response was *burnt out*; another is *a poor little house*. Both reactions are predicative; but the first creates a purely narrative context, while in the

second there is a double connection with the subject *hut*; on the one hand, a positional (namely, syntactic) contiguity, and on the other a semantic similarity.

The same stimulus produced the following substitutive reactions: the tautology *hut*; the synonyms *cabin* and *hovel*; the antonym *palace*, and the metaphors *den* and *burrow*. The capacity of two words to replace one another is an instance of positional similarity, and, in addition, all these responses are linked to the stimulus by semantic similarity (or contrast). Metonymical responses to the same stimulus, such as *thatch*, *litter*, or *poverty*, combine and contrast the positional similarity with semantic contiguity.

In manipulating these two kinds of connection (similarity and contiguity) in both their aspects (positional and semantic) - selecting, combining, and ranking them - an individual exhibits his personal style, his verbal predilections and preferences.

In verbal art the interaction of these two elements is especially pronounced. Rich material for the study of this relationship is to be found in verse patterns which require a compulsory parallelism between adjacent lines, for example in Biblical poetry or in the West Finnic and, to some extent, the Russian oral traditions. This provides an objective criterion of what in the given speech community acts as a correspondence. Since on any verbal level - morphemic, lexical, syntactic, and phraseological - either of these two relations (similarity and contiguity) can appear - and each in either of two aspects - an impressive range of possible configurations is created. Either of the two gravitational poles may prevail. In Russian lyrical songs, for example, metaphoric constructions predominate, while in the heroic epics the metonymic way is preponderant.

In poetry there are various motives which determine the choice between these alternants. The primacy of the metaphoric process in the literary schools of romanticism and symbolism has been repeatedly acknowledged, but it is still insufficiently realized that it is the predominance of metonymy which underlies and actually predetermines the so-called "realistic" trend, which belongs to an intermediary stage between the decline of romanticism and the rise of symbolism and is opposed to both. Following the path of contiguous relationships, the realistic author metonymic-ally digresses from the plot to the atmosphere and from the characters to the setting in space and time. He is fond of synecdochic details. In the scene of Anna Karenina's suicide Tolstoy's artistic attention is focused on the heroine's handbag; and in *War and Peace* the synecdoches "hair on the upper lip" or "bare shoulders" are used by the same writer to stand for the female characters to whom these features belong.

The alternative predominance of one or the other of these two processes is by no means confined to verbal art. The same oscillation occurs in sign systems other than language.¹ A salient example from the history of painting is the manifestly metonymical orientation of cubism, where the object is transformed into a set of synecdoches; the surrealist painters responded with a patently metaphorical attitude. Ever since the productions of D. W. Griffith, the art of the cinema, with its highly developed capacity for changing the angle, perspective, and focus of "shots," has broken with the tradition of the theater and ranged an unprecedented variety of synecdochic "close-ups" and metonymic "set-ups" in general. In such pictures as those of Charlie Chaplin, these devices in turn were superseded by a novel, metaphoric "montage" with its "lap dissolves" - the filmic similes.

The bipolar structure of language (or other semiotic systems), and, in aphasia, the fixation on one of these poles to the exclusion of the other require systematic

comparative study. The retention of either of these alternatives in the two types of aphasia must be confronted with the predominance of the same pole in certain styles, personal habits, current fashions, etc. A careful analysis and comparison of these phenomena with the whole syndrome of the corresponding type of aphasia is an imperative task for joint research by experts in psychopathology, psychology, linguistics, poetics, and semiotics, the general science of signs. The dichotomy here discussed appears to be of primal significance and consequence for all verbal behavior and for human behavior in general.

To indicate the possibilities of the projected comparative research, we choose an example from a Russian folk tale which employs parallelism as a comic device: "Thomas is a bachelor; Jeremiah is unmarried" (*Foma xolost; Erjoma nezenat*). Here the predicates in the two parallel clauses are associated by similarity: they are in fact synonymous. The subjects of both clauses are masculine proper names and hence morphologically similar, while on the other hand they denote two contiguous heroes of the same tale, created to perform identical actions and thus to justify the use of synonymous pairs of predicates. A somewhat modified version of the same construction occurs in a familiar wedding song in which each of the wedding guests is addressed in turn by his first name and patronymic: "Gleb is a bachelor; Ivanovic is unmarried." While both predicates here are again synonyms, the relationship between the two subjects is changed: both are proper names denoting the same man and are normally used contiguously as a mode of polite address.

In the quotation from the folk tale the two parallel clauses refer to two separate facts, the marital status of Thomas and the similar status of Jeremiah. In the verse from the wedding song, however, the two clauses are synonymous: they redundantly reiterate the celibacy of the same hero, splitting him into two verbal hypostases.

The Russian novelist Gleb Ivanovic Uspenskij (1840-1902) in the last years of his life suffered from a mental illness involving a speech disorder. His first name and patronymic, *Gleb Ivanovic*, traditionally combined in polite intercourse, for him split into two distinct names designating two separate beings: Gleb was endowed with all his virtues, while Ivanovic, the name relating the son to the father, became the incarnation of all Uspenskij's vices. The linguistic aspect of this split personality is the patient's inability to use two symbols for the same thing, and it is thus a similarity disorder. Since the similarity disorder is bound up with the metonymical bent, an examination of the literary manner Uspenskij had employed as a young writer takes on particular interest. And the study of Anatolij Kamegulov, who analyzed Uspenskij's style, bears out our theoretical expectations. He shows that Uspenskij had a particular penchant for metonymy, and especially for synecdoche, and that he carried it so far that "the reader is crushed by the multiplicity of detail unloaded on him in a limited verbal space, and is physically unable to grasp the whole, so that the portrait is often lost."

To be sure, the metonymical style in Uspenskij is obviously prompted by the prevailing literary canon of his time, late nineteenth-century "realism"; but the personal stamp of Gleb Ivanovic made his pen particularly suitable for this artistic trend in its extreme manifestations and finally left its mark upon the verbal aspect of his mental illness.

A competition between both devices, metonymic and metaphoric, is manifest in any symbolic process, either intrapersonal or social. Thus in an inquiry into the structure of dreams, the decisive question is whether the symbols and the temporal

sequences used are based on contiguity (Freud's metonymic "displacement" and synecdochic "condensation") or on similarity (Freud's "identification and symbolism"). The principles underlying magic rites have been resolved by Frazer into two types: charms based on the law of similarity and those founded on association by contiguity. The first of these two great branches of sympathetic magic has been called "homoeopathic" or "imitative," and the second, "contagious magic." This bipartition is indeed illuminating. Nonetheless, for the most part, the question of the two poles is still neglected, despite its wide scope and importance for the study of any symbolic behavior, especially verbal, and of its impairments. What is the main reason for this neglect?

Similarity in meaning connects the symbols of a metalanguage with the symbols of the language referred to. Similarity connects a metaphorical term with the term for which it is substituted. Consequently, when constructing a metalanguage to interpret tropes, the researcher possesses more homogeneous means to handle metaphor, whereas metonymy, based on a different principle, easily defies interpretation. Therefore nothing comparable to the rich literature on metaphor can be cited for the theory of metonymy. For the same reason, it is generally realized that romanticism is closely linked with metaphor, whereas the equally intimate ties of realism with metonymy usually remain unnoticed. Not only the tool of the observer but also the object of observation is responsible for the preponderance of metaphor over metonymy in scholarship. Since poetry is focused upon sign, and pragmatical prose primarily upon referent, tropes and figures were studied mainly as poetical devices. The principle of similarity underlies poetry; the metrical parallelism of lines or the phonic equivalence of rhyming words prompts the question of semantic similarity and contrast; there exist, for instance, grammatical and anti-grammatical but never agrammatical rhymes. Prose, on the contrary, is forwarded essentially by contiguity. Thus, for poetry, metaphor, and for prose, metonymy is the line of least resistance and, consequently, the study of poetical tropes is directed chiefly toward metaphor. The actual bipolarity has been artificially replaced in these studies by an amputated, unipolar scheme which, strikingly enough, coincides with one of the two aphasic patterns, namely with the contiguity disorder.

Notes

- 1 I ventured a few sketchy remarks on the metonymical turn in verbal art ("Pro relizm u mystectvi," *Vaplite*, Kharkov, 1927, No. 2).
- 2 Cf. B. Balazs, *Theory of the Film* (London, 1952).

Mythologies

Roland Barthes

Roland Barthes played a major role in the development of Structuralist and Post-Structuralist literary criticism in France from the 1950s to the 1970s. In his early work, *Elements of Semiology* (1965), he introduced the ideas of Saussure to the French intellectual community, and he offered a wide range of exemplary applications of "semiology," or the science of signs, to everything from literature to fashion and cuisine. He went on to write numerous works of Structuralist literary criticism. After 1968, influenced by the work of Jacques Derrida, Barthes turned away from classic Structuralism's concern with the orders of signs and worked instead on the disordering potential of literary semiosis, its tendency to transgress the identities and boundaries (such as the idea of the "author") that define traditional literary study. His essay "Death of the Author" (1968) is something of a Post-Structuralist manifesto, and this stage of Barthes's work achieves its most mature manifestation in his famous *S/Z* (1970), a lengthy reading of a short story by Balzac. These selections from *Mythologies* date from 1957.

In myth, we find again the tri-dimensional pattern which I have just described: the signifier, the signified and the sign. But myth is a peculiar system, in that it is constructed from a semiological chain which existed before it: it is a *second-order semio-logical system*. That which is a sign (namely the associative total of a concept and an image) in the first system, becomes a mere signifier in the second. We must here recall that the materials of mythical speech (the language itself, photography, painting, posters, rituals, objects, etc.), however different at the start, are reduced to a pure signifying function as soon as they are caught by myth. Myth sees in them only the same raw material; their unity is that they all come down to the status of a mere language. Whether it deals with alphabetical or pictorial writing, myth wants to see in them only a sum of signs, a global sign, the final term of a first semiological chain. And it is precisely this final term which will become the first term of the greater system which it builds and of which it is only a part. Everything happens as if myth shifted the formal system of the first significations sideways. As this lateral shift is essential for the analysis of myth, I shall represent it in the following way, it being understood, of course, that the spatialization of the pattern is here only a metaphor:

It can be seen that in myth there are two semiological systems, one of which is staggered in relation to the other: a linguistic system, the language (or the modes of representation which are assimilated to it), which I shall call the *language-object*, because it is the language which myth gets hold of in order to build its own system; and myth itself, which I shall call *metalanguage*, because it is a second language, *in which* one speaks about the first. When he reflects on a metalanguage, the semiologist no longer needs to ask himself questions about the composition of the language-object, he no longer has to take into account the details of the linguistic schema; he will only need to know its total term, or global sign, and only inasmuch as this term lends itself to myth. This is why the semiologist is entitled to treat in the same way writing and pictures: what he retains from them is the fact that they are both *signs*, that they both reach the threshold of myth endowed with the same signifying function, that they constitute, one just as much as the other, a language-object.

It is now time to give one or two examples of mythical speech. I shall borrow the first from an observation by Valéry. 'I am a pupil in the second form in a French *lycée*. I open my Latin grammar, and I read a sentence, borrowed from Aesop or Phaedrus: *quia ego nominor leo*. I stop and think. There is something ambiguous about this statement: on the one hand, the words in it do have a simple meaning: *because my name is lion*. And on the other hand, the sentence is evidently there in order to signify something else to me. Inasmuch as it is addressed to me, a pupil in the second form, it tells me clearly: I am a grammatical example meant to illustrate the rule about the agreement of the predicate. I am even forced to realize that the sentence in no way *signifies* its meaning to me, that it tries very little to tell me something about the lion and what sort of name he has; its true and fundamental signification is to impose itself on me as the presence of a certain agreement of the predicate. I conclude that I am faced with a particular, greater, semiological system, since it is co-extensive with the language: there is, indeed, a signifier, but this signifier is itself formed by a sum of signs, it is in itself a first semiological system (*my name is lion*). Thereafter, the formal pattern is correctly unfolded: there is a signified (*I am a grammatical example*) and there is a global signification, which is none other than the correlation of the signifier and the signified; for neither the naming of the lion nor the grammatical example are given separately.

And here is now another example: I am at the barber's, and a copy of *Paris-Match* is offered to me. On the cover, a young Negro in a French uniform is saluting, with his eyes uplifted, probably fixed on a fold of the tricolour. All this is the *meaning* of the picture. But, whether naively or not, I see very well what it signifies to me: that France is a great Empire, that all her sons, without any colour discrimination, faithfully serve under her flag, and that there is no better answer to the detractors of an alleged colonialism than the zeal shown by this Negro in serving his so-called oppressors. I am therefore again faced with a greater semiological system: there is a signifier, itself already formed with a previous system (*a black soldier is giving the French salute*); there is a signified (it is here a purposeful mixture of Frenchness and militariness); finally, there is a presence of the signified through the signifier.

Before tackling the analysis of each term of the mythical system, one must agree on terminology. We now know that the signifier can be looked at, in myth, from two points of view: as the final term of the linguistic system, or as the first term of the mythical system. We therefore need two names. On the plane of language,

that is, as the final term of the first system, I shall call the signifier: *meaning* {*my name is lion, a Negro is giving the French salute*}, on the plane of myth, I shall call it: *form*. In the case of the signified, no ambiguity is possible: we shall retain the name *concept*. The third term is the correlation of the first two: in the linguistic system, it is the *sign*; but it is not possible to use this word again without ambiguity, since in myth (and this is the chief peculiarity of the latter), the signifier is already formed by the *signs* of the language. I shall call the third term of myth the *signification*. This word is here all the better justified since myth has in fact a double function: it points out and it notifies, it makes us understand something and it imposes it on us....

The Romans in Films

In Mankiewicz's *Julius Caesar*, all the characters are wearing fringes. Some have them curly, some straggly, some tufted, some oily, all have them well combed, and the bald are not admitted, although there are plenty to be found in Roman history. Those who have little hair have not been let off for all that, and the hairdresser - the king-pin of the film - has still managed to produce one last lock which duly reaches the top of the forehead, one of those Roman foreheads, whose smallness has at all times indicated a specific mixture of self-righteousness, virtue and conquest.

What then is associated with these insistent fringes? Quite simply the label of Roman-ness. We therefore see here the mainspring of the Spectacle - the *sign* -operating in the open. The frontal lock overwhelms one with evidence, no one can doubt that he is in Ancient Rome. And this certainty is permanent: the actors speak, act, torment themselves, debate 'questions of universal import', without losing, thanks to this little flag displayed on their foreheads, any of their historical plausibility. Their general representativeness can even expand in complete safety, cross the ocean and the centuries, and merge into the Yankee mugs of Hollywood extras: no matter, everyone is reassured, installed in the quiet certainty of a universe without duplicity, where Romans are Romans thanks to the most legible of signs: hair on the forehead.

A Frenchman, to whose eyes American faces still have something exotic, finds comical the combination of the morphologies of these gangster-sheriffs with the little Roman fringe: it rather looks like an excellent music-hall gag. This is because for the French the sign in this case overshoots the target and discredits itself by letting its aim appear clearly. But this very fringe, when combed on the only naturally Latin forehead in the film, that of Marlon Brando, impresses us and does not make us laugh; and it is not impossible that part of the success of this actor in Europe is due to the perfect integration of Roman capillary habits with the general morphology of the characters he usually portrays. Conversely, one cannot believe in Julius Caesar, whose physiognomy is that of an Anglo-Saxon lawyer - a face with which one is already acquainted through a thousand bit parts in thrillers or comedies, and a compliant skull on which the hairdresser has raked, with great effort, a lock of hair.

In the category of capillary meanings, here is a sub-sign, that of nocturnal surprises: Portia and Calpurnia, woken up at dead of night, have conspicuously uncombed hair. The former, who is young, expresses disorder by flowing locks: her unreadiness is, so to speak, of the first degree. The latter, who is middle-aged,

exhibits a more painstaking vulnerability: a plait winds round her neck and comes to rest on her right shoulder so as to impose the traditional sign of disorder, asymmetry. But these signs are at the same time excessive and ineffectual: they postulate a 'nature' which they have not even the courage to acknowledge fully: they are not 'fair and square'.

Yet another sign in this *Julius Caesar*, all the faces sweat constantly. Labourers, soldiers, conspirators, all have their austere and tense features streaming (with Vaseline). And close-ups are so frequent that evidently sweat here is an attribute with a purpose. Like the Roman fringe or the nocturnal plait, sweat is a sign. Of what? Of moral feeling. Everyone is sweating because everyone is debating something within himself; we are here supposed to be in the locus of a horribly tormented virtue, that is, in the very locus of tragedy, and it is sweat which has the function of conveying this. The populace, upset by the death of Caesar, then by the arguments of Mark Antony, is sweating, and combining economically, in this single sign, the intensity of its emotion and the simplicity of its condition. And the virtuous men, Brutus, Cassius, Casca, are ceaselessly perspiring too, testifying thereby to the enormous physiological labour produced in them by a virtue just about to give birth to a crime. To sweat is to think -which evidently rests on the postulate, appropriate to a nation of businessmen, that thought is a violent, cataclysmic operation, of which sweat is only the most benign symptom. In the whole film, there is but one man who does not sweat and who remains smooth-faced, unperturbed and watertight: Caesar. Of course Caesar, the *object* of the crime, remains dry since *he* does not know, *he does not think*, and so must keep the firm and polished texture of an exhibit standing isolated in the courtroom.

Here again, the sign is ambiguous: it remains on the surface, yet does not for all that give up the attempt to pass itself off as depth. It aims at making people understand (which is laudable) but at the same time suggests that it is spontaneous (which is cheating); it presents itself at once as intentional and irrepressible, artificial and natural, manufactured and discovered. This can lead us to an ethic of signs. Signs ought to present themselves only in two extreme forms: either openly intellectual and so remote that they are reduced to an algebra, as in the Chinese theatre, where a flag on its own signifies a regiment; or deeply rooted, invented, so to speak, on each occasion, revealing an internal, a hidden facet, and indicative of a moment in time, no longer of a concept (as in the art of Stanislavsky, for instance). But the intermediate sign, the fringe of Roman-ness or the sweating of thought, reveals a degraded spectacle, which is equally afraid of simple reality and of total artifice. For although it is a good thing if a spectacle is created to make the world more explicit, it is both reprehensible and deceitful to confuse the sign with what is signified. And it is a duplicity which is peculiar to bourgeois art: between the intellectual and the visceral sign is hypocritically inserted a hybrid, at once elliptical and pretentious, which is pompously christened '*nature*'.

Soap-powders and Detergents

The first World Detergent Congress (Paris, September 1954) had the effect of authorizing the world to yield to *Onto* euphoria: not only do detergents have no harmful effect on the skin, but they can even perhaps save miners from silicosis. These products have been in the last few years the object of such massive advertising that

they now belong to a region of French daily life which the various types of psycho-analysis would do well to pay some attention to if they wish to keep up to date. One could then usefully contrast the psycho-analysis of purifying fluids (chlorinated, for example) with that of soap-powders (*Lux*, *Persil*) or that of detergents (*Omo*). The relations between the evil and the cure, between dirt and a given product, are very different in each case.

Chlorinated fluids, for instance, have always been experienced as a sort of liquid fire, the action of which must be carefully estimated, otherwise the object itself would be affected, 'burnt'. The implicit legend of this type of product rests on the idea of a violent, abrasive modification of matter: the connotations are of a chemical or mutilating type: the product 'kills' the dirt. Powders, on the contrary, are separating agents: their ideal role is to liberate the object from its circumstantial imperfection: dirt is 'forced out' and no longer killed; in the *Omo* imagery, dirt is a diminutive enemy, stunted and black, which takes to its heels from the fine immaculate linen at the sole threat of the judgment of *Omo*. Products based on chlorine and ammonia are without doubt the representatives of a kind of absolute fire, a saviour but a blind one. Powders, on the contrary, are selective, they push, they drive dirt through the texture of the object, their function is keeping public order not making war. This distinction has ethnographic correlatives: the chemical fluid is an extension of the washerwoman's movements when she beats the clothes, while powders rather replace those of the housewife pressing and rolling the washing against a sloping board.

But even in the category of powders, one must in addition oppose against advertisements based on psychology those based on psycho-analysis (I use this word without reference to any specific school). '*Persil* Whiteness' for instance, bases its prestige on the evidence of a result; it calls into play vanity, a social concern with appearances, by offering for comparison two objects, one of which is *whiter than* the other. Advertisements for *Omo* also indicate the effect of the product (and in superlative fashion, incidentally), but they chiefly reveal its mode of action; in doing so, they involve the consumer in a kind of direct experience of the substance, make him the accomplice of a liberation rather than the mere beneficiary of a result; matter here is endowed with value-bearing states.

Omo uses two of these, which are rather novel in the category of detergents: the deep and the foamy. To say that *Omo* cleans in depth (see the Cinema-Publicite advertisement) is to assume that linen is deep, which no one had previously thought, and this unquestionably results in exalting it, by establishing it as an object favourable to those obscure tendencies to enfold and caress which are found in every human body. As for foam, it is well known that it signifies luxury. To begin with, it appears to lack any usefulness; then, its abundant, easy, almost infinite proliferation allows one to suppose there is in the substance from which it issues a vigorous germ, a healthy and powerful essence, a great wealth of active elements in a small original volume. Finally, it gratifies in the consumer a tendency to imagine matter as something airy, with which contact is effected in a mode both light and vertical, which is sought after like that of happiness either in the gustatory category (foie gras, entremets, wines), in that of clothing (muslin, tulle), or that of soaps (film-star in her bath). Foam can even be the sign of a certain spirituality, inasmuch as the spirit has the reputation of being able to make something out of nothing, a large surface of effects out of a small volume of causes (creams have a very different 'psychoanalytical' meaning, of a soothing kind: they suppress wrinkles, pain, smarting, etc.). What

matters is the art of having disguised the abrasive function of the detergent under the delicious image of a substance at once deep and airy which can govern the molecular order of the material without damaging it. A euphoria, incidentally, which must not make us forget that there is one plane on which *Persil* and *Onto* are one and the same: the plane of the Anglo-Dutch trust *Unilever*.

The *Blue Guide*

The *Blue Guide* hardly knows the existence of scenery except under the guise of the picturesque. The picturesque is found any time the ground is uneven. We find again here this bourgeois promoting of the mountains, this old Alpine myth (since it dates back to the nineteenth century) which Gide rightly associated with Helvetico-Protestant morality and which has always functioned as a hybrid compound of the cult of nature and of puritanism (regeneration through clean air, moral ideas at the sight of mountain-tops, summit-climbing as civic virtue, etc.). Among the views elevated by the *Blue Guide* to aesthetic existence, we rarely find plains (redeemed only when they can be described as fertile), never plateaux. Only mountains, gorges, defiles and torrents can have access to the pantheon of travel, inasmuch, probably, as they seem to encourage a morality of effort and solitude. Travel according to the *Blue Guide* is thus revealed as a labour-saving adjustment, the easy substitute for the morally uplifting walk. This in itself means that the mythology of the *Blue Guide* dates back to the last century, to that phase in history when the bourgeoisie was enjoying a kind of new-born euphoria in *buying* effort, in keeping its image and essence without feeling any of its ill-effects. It is therefore in the last analysis, quite logically and quite stupidly, the gracelessness of a landscape, its lack of spaciousness or human appeal, its verticality, so contrary to the bliss of travel, which account for its interest. Ultimately, the *Guide* will coolly write: '*The road becomes very picturesque (tunnels): it matters little that one no longer sees anything, since the tunnel here has become the sufficient sign of the mountain; it is a financial security stable enough for one to have no further worry about its value over the counter.*

Just as hilliness is overstressed to such an extent as to eliminate all other types of scenery, the human life of a country disappears to the exclusive benefit of its monuments. For the *Blue Guide*, men exist only as 'types'. In Spain, for instance, the Basque is an adventurous sailor, the Levantine a light-hearted gardener, the Catalan a clever tradesman and the Cantabrian a sentimental highlander. We find again here this disease of thinking in essences, which is at the bottom of every bourgeois mythology of man (which is why we come across it so often). The ethnic reality of Spain is thus reduced to a vast classical ballet, a nice neat commedia delParte, whose improbable typology serves to mask the real spectacle of conditions, classes and professions. For the *Blue Guide*, men exist as social entities only in trains, where they fill a 'very mixed' Third Class. Apart from that, they are a mere introduction, they constitute a charming and fanciful decor, meant to surround the essential part of the country: its collection of monuments.

If one excepts its wild defiles, fit for moral ejaculations, Spain according to the *Blue Guide* knows only one type of space, that which weaves, across a few nondescript lacunae, a close web of churches, vestries, reredoses, crosses, altar-curtains, spires (always octagonal), sculpted groups (Family and Labour), Romanesque porches, naves

and life-size crucifixes. It can be seen that all these monuments are religious, for from a bourgeois point of view it is almost impossible to conceive a History of Art which is not Christian and Roman Catholic. Christianity is the chief purveyor of tourism, and one travels only to visit churches. In the case of Spain, this imperialism is ludicrous, for Catholicism often appears there as a barbaric force which has stupidly defaced the earlier achievements of Muslim civilization: the mosque at Cordoba, whose wonderful forest of columns is at every turn obstructed by massive blocks of altars, or a colossal Virgin (set up by Franco) denaturing the site which it aggressively dominates - all this should help the French bourgeois to glimpse at least once in his life that historically there is also a reverse side to Christianity.

Generally speaking, the *Blue Guide* testifies to the futility of all analytical descriptions, those which reject both explanations and phenomenology: it answers in fact none of the questions which a modern traveller can ask himself while crossing a countryside which is real *and which exists in time*. To select only monuments suppresses at one stroke the reality of the land and that of its people, it accounts for nothing of the present, that is, nothing historical, and as a consequence, the monuments themselves become undecipherable, therefore senseless. What is to be seen is thus constantly in the process of vanishing, and the *Guide* becomes, through an operation common to all mystifications, the very opposite of what it advertises, an agent of blindness. By reducing geography to the description of an uninhabited world of monuments, the *Blue Guide* expresses a mythology which is obsolete for a part of the bourgeoisie itself. It is unquestionable that travel has become (or become again) a method of approach based on human realities rather than 'culture': once again (as in the eighteenth century, perhaps) it is everyday life which is the main object of travel, and it is social geography, town-planning, sociology, economics which outline the framework of the actual questions asked today even by the merest layman. But as for the *Blue Guide*, it still abides by a partly superseded bourgeois mythology, that which postulated (religious) Art as the fundamental value of culture, but saw its 'riches' and 'treasures' only as a reassuring accumulation of goods (cf. the creation of museums). This behaviour expressed a double urge: to have at one's disposal a cultural alibi as ethereal as possible, and to maintain this alibi in the toils of a computable and acquisitive system, so that one could at any moment do the accounts of the ineffable. It goes without saying that this myth of travel is becoming quite anachronistic, even among the bourgeoisie, and I suppose that if one entrusted the preparation of a new guide-book to, say, the lady-editors at *L'Express* or the editors of *Match*, we would see appearing, questionable as they would still probably be, quite different countries: after the Spain of Anquetil or Larousse, would follow the Spain of Siegfried, then that of Fourastie. Notice how already, in the *Michelin Guide*, the number of bathrooms and forks indicating good restaurants is vying with that of 'artistic curiosities': even bourgeois myths have their differential geology.

It is true that in the case of Spain, the blinkered and old-fashioned character of the description is what is best suited to the latent support given by the *Guide* to Franco. Beside the historical accounts proper (which are rare and meagre, incidentally, for it is well known that History is not a good bourgeois), those accounts in which the Republicans are always '*extremists*' looting churches - but nothing on Guernica - while the good 'Nationalists', on the contrary, spend their time '*liberating*', solely by '*skilful strategic manoeuvres*' and '*heroic feats of resistance*', let me mention the flowering of a splendid myth-alibi: that of the *prosperity* of the country. Needless to

say, this prosperity is 'statistical' and 'global', or to be more accurate: 'commercial'. The *Guide* does not tell us, of course, how this fine prosperity is shared out: *hierarchically*, probably, since they think it fit to tell us that "*the serious and patient effort of this people has also included the reform of its political system, in order to achieve regeneration through the loyal application of sound principles of order and hierarchy.*"

The Great Family of Man

A big exhibition of photographs has been held in Paris, the aim of which was to show the universality of human actions in the daily life of all the countries of the world: birth, death, work, knowledge, play, always impose the same types of behaviour; there is a family of Man.

The Family of Man, such at any rate was the original title of the exhibition which came here from the United States. The French have translated it as: *The Great Family of Man*. So what could originally pass for a phrase belonging to zoology, keeping only the similarity in behaviour, the unity of a species, is here amply moralized and sentimentalized. We are at the outset directed to this ambiguous myth of the human 'community', which serves as an alibi to a large part of our humanism.

This myth functions in two stages: first the difference between human morphologies is asserted, exoticism is insistently stressed, the infinite variations of the species, the diversity in skins, skulls and customs are made manifest, the image of Babel is complacently projected over that of the world. Then, from this pluralism, a type of unity is magically produced: man is born, works, laughs and dies everywhere in the same way; and if there still remains in these actions some ethnic peculiarity, at least one hints that there is underlying each one an identical 'nature', that their diversity is only formal and does not belie the existence of a common mould. Of course this means postulating a human essence, and here is God re-introduced into our Exhibition: the diversity of men proclaims his power, his richness; the unity of their gestures demonstrates his will. This is what the introductory leaflet confides to us when it states, by the pen of M. Andre Chamson, that '*this look over the human condition must somewhat resemble the benevolent gaze of God on our absurd and sublime anti-hiir*'. The pietistic intention is underlined by the quotations which accompany each chapter of the Exhibition: these quotations often are 'primitive' proverbs or verses from the Old Testament. They all define an eternal wisdom, a class of assertions which escape History: '*The Earth is a Mother who never dies, Eat bread and salt and speak the truth*, etc' This is the reign of gnomic truths, the meeting of all the ages of humanity at the most neutral point of their nature, the point where the obviousness of the truism has no longer any value except in the realm of a purely 'poetic' language. Everything here, the content and appeal of the pictures, the discourse which justifies them, aims to suppress the determining weight of History: we are held back at the surface of an identity, prevented precisely by sentimentality from penetrating into this ulterior zone of human behaviour where historical alienation introduces some 'differences' which we shall here quite simply call 'injustices'.

This myth of the human 'condition' rests on a very old mystification, which always consists in placing Nature at the bottom of History. Any classic humanism postulates that in scratching the history of men a little, the relativity of their institutions or the superficial diversity of their skins (but why not ask the parents of

Emmet Till, the young Negro assassinated by the Whites what *they* think of *The Great Family of Man*)), one very quickly reaches the solid rock of a universal human nature. Progressive humanism, on the contrary, must always remember to reverse the terms of this very old imposture, constantly to scour nature, its 'laws' and its 'limits' in order to discover History there, and at last to establish Nature itself as historical.

Examples? Here they are: those of our Exhibition. Birth, death? Yes, these are facts of nature, universal facts. But if one removes History from them, there is nothing more to be said about them; any comment about them becomes purely tautological. The failure of photography seems to me to be flagrant in this connection: to reproduce death or birth tells us, literally, nothing. For these natural facts to gain access to a true language, they must be inserted into a category of knowledge which means postulating that one can transform them, and precisely subject their naturalness to our human criticism. For however universal, they are the signs of an historical writing. True, children are *always* born: but in the whole mass of the human problem, what does the 'essence' of this process matter to us, compared to its modes which, as for them, are perfectly historical? Whether or not the child is born with ease or difficulty, whether or not his birth causes suffering to his mother, whether or not he is threatened by a high mortality rate, whether or not such and such a type of future is open to him: this is what your Exhibitions should be telling people, instead of an eternal lyricism of birth. The same goes for death: must we really celebrate its essence once more, and thus risk forgetting that there is still so much we can do to fight it? It is this very young, far too young power that we must exalt, and not the sterile identity of 'natural' death.

And what can be said about work, which the Exhibition places among great universal facts, putting it on the same plane as birth and death, as if it was quite evident that it belongs to the same order of fate? That work is an age-old fact does not in the least prevent it from remaining a perfectly historical fact. Firstly, and evidently, because of its modes, its motivations, its ends and its benefits, which matter to such an extent that it will never be fair to confuse in a purely gestural identity the colonial and the Western worker (let us also ask the North African workers of the Goutte d'Or district in Paris what they think of *The Great Family of Man*). Secondly, because of the very differences in its inevitability: we know very well that work is 'natural' just as long as it is 'profitable', and that in modifying the inevitability of the profit, we shall perhaps one day modify the inevitability of labour. It is this entirely historified work which we should be told about, instead of an eternal aesthetics of laborious gestures.

So that I rather fear that the final justification of all this Adamism is to give to the immobility of the world the alibi of a 'wisdom' and a 'lyricism' which only make the gestures of man look eternal the better to defuse them.

The Archaeology of Knowledge

Michel Foucault

First published in 1969, *The Archaeology of Knowledge* describes discourses as transpersonal systems of language that embody the ideas, values, and shared vocabularies of communities of knowledge. Foucault's book was Structuralist to the degree that it displaced from center stage the traditional human subject of knowledge. Discourses are characterized by rules and conventions that exceed the control of any one author, and indeed, they regulate what authors say and know. Foucault's work along these lines was especially influential for scholars interested in such things as advice and etiquette books for women and important, though minor, texts adjacent to famous literary works that might have been ignored in the past because they were not "great works" or by "major figures."

The Unities of Discourse

The use of concepts of discontinuity, rupture, threshold, limit, series, and transformation present all historical analysis not only with questions of procedure, but with theoretical problems. It is these problems that will be studied here (the questions of procedure will be examined in later empirical studies - if the opportunity, the desire, and the courage to undertake them do not desert me). These theoretical problems too will be examined only in a particular field: in those disciplines - so unsure of their frontiers, and so vague in content - that we call the history of ideas, or of thought, or of science, or of knowledge.

But there is a negative work to be carried out first: we must rid ourselves of a whole mass of notions, each of which, in its own way, diversifies the theme of continuity. They may not have a very rigorous conceptual structure, but they have a very precise function. Take the notion of tradition: it is intended to give a special temporal status to a group of phenomena that are both successive and identical (or at least similar); it makes it possible to rethink the dispersion of history in the form of the same; it allows a reduction of the difference proper to every beginning, in order to pursue without discontinuity the endless search for the origin; tradition enables us to isolate the new against a background of permanence, and to transfer its merit to originality, to genius, to the decisions proper to individuals. Then there is the notion of influence, which provides a support - of too magical a kind to be very amenable to analysis - for the facts of transmission and communication; which refers to an apparently causal process (but with neither rigorous delimitation nor theoretical definition) the phenomena of resemblance or repetition; which links, at a distance and through time - as if through the mediation of a medium of propagation such defined unities as individuals, *œuvres*,

notions, or theories. There are the notions of development and evolution: they make it possible to group a succession of dispersed events, to link them to one and the same organizing principle, to subject them to the exemplary power of life (with its adaptations, its capacity for innovation, the incessant correlation of its different elements, its systems of assimilation and exchange), to discover, already at work in each beginning, a principle of coherence and the outline of a future unity, to master time through a perpetually reversible relation between an origin and an end that are never given, but are always at work. There is the notion of "spirit," which enables us to establish between the simultaneous or successive phenomena of a given period a community of meanings, symbolic links, an interplay of resemblance and reflexion, or which allows the sovereignty of collective consciousness to emerge as the principle of unity and explanation. We must question those ready-made syntheses, those groupings that we normally accept before any examination, those links whose validity is recognized from the outset. We must oust those forms and obscure forces by which we usually link the discourse of one man with that of another; they must be driven out from the darkness in which they reign. And instead of according them unqualified, spontaneous value, we must accept, in the name of methodological rigor, that, in the first instance, they concern only a population of dispersed events.

We must also question those divisions or groupings with which we have become so familiar. Can one accept, as such, the distinction between the major types of discourse, or that between such forms or genres as science, literature, philosophy, religion, history, fiction, etc., and which tend to create certain great historical individualities? We are not even sure of ourselves when we use these distinctions in our own world of discourse, let alone when we are analyzing groups of statements which, when first formulated, were distributed, divided, and characterized in a quite different way: after all, "literature" and "politics" are recent categories, which can be applied to medieval culture, or even classical culture, only by a retrospective hypothesis, and by an interplay of formal analogies or semantic resemblances; but neither literature, nor politics, nor philosophy and the sciences articulated the field of discourse, in the seventeenth or eighteenth century, as they did in the nineteenth century. In any case, these divisions - whether our own, or those contemporary with the discourse under examination - are always themselves reflexive categories, principles of classification, normative rules, institutionalized types: they, in turn, are facts of discourse that deserve to be analyzed beside others; of course, they also have complex relations with each other, but they are not intrinsic, autochthonous, and universally recognizable characteristics.

But the unities that must be suspended above all are those that emerge in the most immediate way: those of the book and the *œuvre*. At first sight, it would seem that one could not abandon these unities without extreme artificiality. Are they not given in the most definite way? There is the material individualization of the book, which occupies a determined space, which has an economic value, and which itself indicates, by a number of signs, the limits of its beginning and its end; and there is the establishment of an *œuvre*, which we recognize and delimit by attributing a certain number of texts to an author. And yet as soon as one looks at the matter a little more closely the difficulties begin. The material unity of the book? Is this the same in the case of an anthology of poems, a collection of posthumous fragments, Desargues' *Traite des Coniques*, or a volume of Michelet's *Histoire de France*? Is it the same in the case of Mallarmé's *Un Coup de dés*, the trial of Gilles de Rais, Butor's *San Marco*,

or a Catholic missal? In other words, is not the material unity of the volume a weak, accessory unity in relation to the discursive unity of which it is the support? But is this discursive unity itself homogeneous and uniformly applicable? A novel by Stendhal and a novel by Dostoevsky do not have the same relation of individuality as that between two novels belonging to Balzac's cycle *La Comedie humaine*; and the relation between Balzac's novels is not the same as that existing between Joyce's *Ulysses* and the *Odyssey*. The frontiers of a book are never clear-cut: beyond the title, the first lines, and the last full stop, beyond its internal configuration and its autonomous form, it is caught up in a system of references to other books, other texts, other sentences: it is a node within a network. And this network of references is not the same in the case of a mathematical treatise, a textual commentary, a historical account, and an episode in a novel cycle; the unity of the book, even in the sense of a group of relations, cannot be regarded as identical in each case. The book is not simply the object that one holds in one's hands; and it cannot remain within the little parallelepiped that contains it: its unity is variable and relative. As soon as one questions that unity, it loses its self-evidence; it indicates itself, constructs itself, only on the basis of a complex field of discourse...

Once these immediate forms of continuity are suspended, an entire field is set free. A vast field, but one that can be defined nonetheless: this field is made up of the totality of all effective statements (whether spoken or written), in their dispersion as events and in the occurrence that is proper to them. Before approaching, with any degree of certainty, a science, or novels, or political speeches, or the *oeuvre* of an author, or even a single book, the material with which one is dealing is, in its raw, neutral state, a population of events in the space of discourse in general. One is led therefore to the project of a *pure description of discursive events* as the horizon for the search for the unities that form within it. This description is easily distinguishable from an analysis of the language. Of course, a linguistic system can be established (unless it is constructed artificially) only by using a corpus of statements, or a collection of discursive facts; but we must then define, on the basis of this grouping, which has value as a sample, rules that may make it possible to construct other statements than these: even if it has long since disappeared, even if it is no longer spoken, and can be reconstructed only on the basis of rare fragments, a language (*langue*) is still a system for possible statements, a finite body of rules that authorizes an infinite number of performances. The field of discursive events, on the other hand, is a grouping that is always finite and limited at any moment to the linguistic sequences that have been formulated; they may be innumerable, they may, in sheer size, exceed the capacities of recording, memory, or reading: nevertheless they form a finite grouping. The question posed by language analysis of some discursive fact or other is always: according to what rules has a particular statement been made, and consequently according to what rules could other similar statements be made? The description of the events of discourse poses a quite different question: how is it that one particular statement appeared rather than another?

It is also clear that this description of discourses is in opposition to the history of thought. There too a system of thought can be reconstituted only on the basis of a definite discursive totality. But this totality is treated in such a way that one tries to rediscover beyond the statements themselves the intention of the speaking subject, his conscious activity, what he meant, or, again, the unconscious activity that took place, despite himself, in what he said or in the almost imperceptible fracture of his

actual words; in any case, we must reconstitute another discourse, rediscover the silent murmuring, the inexhaustible speech that animates from within the voice that one hears, re-establish the tiny, invisible text that runs between and sometimes collides with them. The analysis of thought is always allegorical in relation to the discourse that it employs. Its question is unfailingly: what was being said in what was said? The analysis of the discursive field is orientated in a quite different way; we must grasp the statement in the exact specificity of its occurrence; determine its conditions of existence, fix at least its limits, establish its correlations with other statements that may be connected with it, and show what other forms of statement it excludes. We do not seek below what is manifest the half silent murmur of another discourse; we must show why it could not be other than it was, in what respect it is exclusive of any other, how it assumes, in the midst of others and in relation to them, a place that no other could occupy. The question proper to such an analysis might be formulated in this way: what is this specific existence that emerges from what is said and nowhere else?

We must ask ourselves what purpose is ultimately served by this suspension of all the accepted unities, if, in the end, we return to the unities that we pretended to question at the outset. In fact, the systematic erasure of all given unities enables us first of all to restore to the statement the specificity of its occurrence, and to show that discontinuity is one of those great accidents that create cracks not only in the geology of history but also in the simple fact of the statement; it emerges in its historical irruption; what we try to examine is the incision that it makes, that irreducible - and very often tiny - emergence. However banal it may be, however unimportant its consequences may appear to be, however quickly it may be forgotten after its appearance, however little heard or however badly deciphered we may suppose it to be, a statement is always an event that neither the language (*langue*) nor the meaning can quite exhaust. It is certainly a strange event: first, because on the one hand it is linked to the gesture of writing or to the articulation of speech, and also on the other hand it opens up to itself a residual existence in the field of a memory, or in the materiality of manuscripts, books, or any other form of recording; secondly, because, like every event, it is unique, yet subject to repetition, transformation, and reactivation; thirdly, because it is linked not only to the situations that provoke it, and to the consequences that it gives rise to, but at the same time, and in accordance with a quite different modality, to the statements that precede and follow it.

But if we isolate, in relation to the language and to thought, the occurrence of the statement/event, it is not in order to spread over everything a dust of facts. It is in order to be sure that this occurrence is not linked with synthesizing operations of a purely psychological kind (the intention of the author, the form of his mind, the rigor of his thought, the themes that obsess him, the project that traverses his existence and gives it meaning) and to be able to grasp other forms of regularity, other types of relations. Relations between statements (even if the author is unaware of them; even if the statements do not have the same author; even if the authors were unaware of each other's existence); relations between groups of statements thus established (even if these groups do not concern the same, or even adjacent, fields; even if they do not possess the same formal level; even if they are not the locus of assignable exchanges); relations between statements and groups of statements and events of a quite different kind (technical, economic, social, political). To reveal in all its purity the space in which discursive events are deployed is not to undertake to re-establish it in an

isolation that nothing could overcome; it is not to close it upon itself; it is to leave oneself free to describe the interplay of relations within it and outside it.

The third purpose of such a description of the facts of discourse is that by freeing them of all the groupings that purport to be natural, immediate, universal unities, one is able to describe other unities, but this time by means of a group of controlled decisions. Providing one defines the conditions clearly, it might be legitimate to constitute, on the basis of correctly described relations, discursive groups that are not arbitrary, and yet remain invisible. Of course, these relations would never be formulated for themselves in the statements in question (unlike, for example, those explicit relations that are posed and spoken in discourse itself, as in the form of the novel, or a series of mathematical theorems). But in no way would they constitute a sort of secret discourse, animating the manifest discourse from within; it is not therefore an interpretation of the facts of the statement that might reveal them, but the analysis of their coexistence, their succession, their mutual functioning, their reciprocal determination, and their independent or correlative transformation...

Discursive Formations

Whenever one can describe, between a number of statements, such a system of dispersion, whenever, between objects, types of statement, concepts, or thematic choices, one can define a regularity (an order, correlations, positions and function-ings, transformations), we will say, for the sake of convenience, that we are dealing with a *discursive formation* - thus avoiding words that are already overlaid with conditions and consequences, and in any case inadequate to the task of designating such a dispersion, such as "science," "ideology," "theory," or "domain of objectivity." The conditions to which the elements of this division (objects, mode of statement, concepts, thematic choices) are subjected we shall call the *rules of formation*. The rules of formation are conditions of existence (but also of coexistence, maintenance, modification, and disappearance) in a given discursive division.

We can now complete the analysis and see to what extent it fulfills, and to what extent it modifies, the initial project.

Taking those group figures which, in an insistent but confused way, presented themselves as *psychology*, *economics*, *grammar*, *medicine*, we asked on what kind of unity they could be based: were they simply a reconstruction after the event, based on particular works, successive theories, notions and themes some of which had been abandoned, others maintained by tradition, and again others fated to fall into oblivion only to be revived at a later date? Were they simply a series of linked enterprises?

We sought the unity of discourse in the objects themselves, in their distribution, in the interplay of their differences, in their proximity or distance - in short, in what is given to the speaking subject; and, in the end, we are sent back to a setting-up of relations that characterizes discursive practice itself; and what we discover is neither a configuration, nor a form, but a group of *rules* that are immanent in a practice, and define it in its specificity. We also used, as a point of reference, a unity like *psycho-pathology*: if we had wanted to provide it with a date of birth and precise limits, it would no doubt have been necessary to discover when the word was first used, to what kind of analysis it could be applied, and how it achieved its separation from neurology on the one hand and psychology on the other. What has emerged is a

unity of another type, which does not appear to have the same dates, or the same surface, or the same articulations, but which may take account of a group of objects for which the term psychopathology was merely a reflexive, secondary, classificatory rubric. Psychopathology finally emerged as a discipline in a constant state of renewal, subject to constant discoveries, criticisms, and corrected errors; the system of formation that we have defined remains stable. But let there be no misunderstanding: it is not the objects that remain constant, nor the domain that they form; it is not even their point of emergence or their mode of characterization; but the relation between the surfaces on which they appear, on which they can be delimited, on which they can be analyzed and specified.

In the descriptions for which I have attempted to provide a theory, there can be no question of interpreting discourse with a view to writing a history of the referent. In the example chosen, we are not trying to find out who was mad at a particular period, or in what his madness consisted, or whether his disturbances were identical with those known to us today. We are not asking ourselves whether witches were unrecognized and persecuted madmen and madwomen, or whether, at a different period, a mystical or aesthetic experience was not unduly medicalized. We are not trying to reconstitute what madness itself might be, in the form in which it first presented itself to some primitive, fundamental, deaf, scarcely articulated experience, and in the form in which it was later organized (translated, deformed, travestied, perhaps even repressed) by discourses, and the oblique, often twisted play of their operations. Such a history of the referent is no doubt possible; and I have no wish at the outset to exclude any effort to uncover and free these "prediscursive" experiences from the tyranny of the text. But what we are concerned with here is not to neutralize discourse, to make it the sign of something else, and to pierce through its density in order to reach what remains silently anterior to it, but on the contrary to maintain it in its consistency, to make it emerge in its own complexity. What, in short, we wish to do is to dispense with "things." To "depresentify" them. To conjure up their rich, heavy, immediate plenitude; which we usually regard as the primitive law of a discourse that has become divorced from it through error, oblivion, illusion, ignorance, or the inertia of beliefs and traditions, or even the perhaps unconscious desire not to see and not to speak. To substitute for the enigmatic treasure of "things" anterior to discourse, the regular formation of objects that emerge only in discourse. To define these *objects* without reference to the *ground*, the foundation of *things*, but by relating them to the body of rules that enable them to form as objects of a discourse and thus constitute the conditions of their historical appearance. To write a history of discursive objects that does not plunge them into the common depth of a primal soil, but deploys the nexus of regularities that govern their dispersion.

However, to suppress the stage of "things themselves" is not necessarily to return to the linguistic analysis of meaning. When one describes the formation of the objects of a discourse, one tries to locate the relations that characterize a discursive practice, one determines neither a lexical organization, nor the scissions of a semantic field: one does not question the meaning given at a particular period to such words as "melancholia" or "madness without delirium," nor the opposition of content between "psychosis" and "neurosis." Not, I repeat, that such analyses are regarded as illegitimate or impossible; but they are not relevant when we are trying to discover, for example, how criminality could become an object of medical expertise, or sexual

deviation a possible object of psychiatric discourse. The analysis of lexical contents defines either the elements of meaning at the disposal of speaking subjects in a given period, or the semantic structure that appears on the surface of a discourse that has already been spoken; it does not concern discursive practice as a place in which a tangled plurality - at once superposed and incomplete - of objects is formed and deformed, appears and disappears.

The sagacity of the commentators is not mistaken: from the kind of analysis that I have undertaken, *words* are as deliberately absent as *things* themselves; any description of a vocabulary is as lacking as any reference to the living plenitude of experience. We shall not return to the state anterior to discourse - in which nothing has yet been said, and in which things are only just beginning to emerge out of the grey light; and we shall not pass beyond discourse in order to rediscover the forms that it has created and left behind it; we shall remain, or try to remain, at the level of discourse itself. Since it is sometimes necessary to dot the "i"s of even the most obvious absences, I will say that in all these searches, in which I have still progressed so little, I would like to show that "discourses," in the form in which they can be heard or read, are not, as one might expect, a mere intersection of things and words: an obscure web of things, and a manifest, visible, colored chain of words; I would like to show that discourse is not a slender surface of contact, or confrontation, between a reality and a language (*langue*), the indication of a lexicon and an experience; I would like to show with precise examples that in analyzing discourses themselves, one sees the loosening of the embrace, apparently so tight, of words and things, and the emergence of a group of rules proper to discursive practice. These rules define not the dumb existence of a reality, nor the canonical use of a vocabulary, but the ordering of objects. "Words and things" is the entirely serious title of a problem, it is the ironic title of a work that modifies its own form, displaces its own data, and reveals, at the end of the day, a quite different task. A task that consists of not - of no longer - treating discourses as groups of signs (signifying elements referring to, contents or representations) but as practices that systematically form the objects of which they speak. Of course, discourses are composed of signs; but what they do is more than use these signs to designate things. It is this *more* that renders them irreducible to the language (*langue*) and to speech. It is this "more" that we must reveal and describe.

Note

- 1 This is written against an explicit theme of my book *Madness and Civilization*, and one that recurs particularly in the Preface.

The Structure of Narrative Transmission

Seymour Chatman

Seymour Chatman's *Story and Discourse: Narrative Structure in Fiction and Film* (1978) played an important role in the development of modern "narratology." In this earlier essay (1972), he begins to develop the idea that narrative is a discourse that follows conventions and rules,

It is popular nowadays to assume that narrative is a semiological or quasi-semio-logical structure quite separate from the language or other medium which communicates it. As such it consists of an expression plane (called 'narrative discourse', or simply 'discourse') and a content plane (called 'story').¹ The expression plane contains the set of narrative *statements*, where 'statement' is independent of and more abstract than any particular manifestation. A certain posture in the ballet, a series of film shots, a whole paragraph in a novel, or only a single word - any of these might be the actualizations of a single narrative statement, since *narrative* as such is independent of medium. The fundamental narrative verb is DO, or where the subject is patient, rather than agent, HAPPEN. As Aristotle maintains, *action* is the fundamental narrative element. Of course, actions are only performed by (or happen to) actors, upon or in reference to objects. So we must recognize not only narrative statements of actions - I will call them PROCESS statements - but also narrative statements of existence which I will call EXISTENCE statements (these include descriptions).

Crosscutting this dichotomy is another which is based on whether the statement is directly presented to the audience or mediated by someone - the someone we call the narrator. Direct presentation presumes a kind of 'overhearing' or 'spying' on the audience's part; in mediated narration, on the other hand, the audience is directly addressed by a narrator. This is essentially the ancient distinction between *mimesis* and *diegesis*, or in modern terms between *showing* and *telling*. Insofar as there is telling, there must be a teller, a narrating voice. To specify the four consequent possibilities, I propose the terms ENACTS (the operation of an unmediated or 'shown' process statement), RECOUNTS (that of a 'told' process statement), PRESENTS (that of a 'shown' stasis statement) and DESCRIBES (that of a 'told' stasis statement). It is essential to understand that 'statement' is used here in an abstract sense, independent of any particular medium. We can still agree with Aristotle that *mimesis* is the mode of the drama and *diegesis* that of the dithyramb or pure lyric expression, and that epic or narrative is a mixed mode, combining elements both of direct and imitated speech. Cinema of course can also contain diegetic elements - for instance, captions and legends which help to set the scene or which recount interven-

ing events. And Brecht has brought such devices into the theatre. But the medium of drama is more typically presentational; there do not need to be existence statements, since the existents are simply *there*, on the stage or screen - characters, props, stage-settings. Of course, mixed modes are possible: for instance, a character may narrate a story on stage, or the like. The cinema regularly uses a disembodied narrative voice (technically marked in scripts as 'Voice Over'). It sometimes happens that there is a virtual redundancy - the narrative voice telling exactly what the camera shows; good examples occur in Robert Bresson's film version of Bernanos' *Journal d'un Cure de Campagne*. For this, as for other reasons, the narrative film has affinities with literary narrative that it does not share with plays. Indeed, the term 'narrative film' is often used to distinguish this genre from the 'documentary'. Ballet, too, is radically mimetic; but comic-strips are generally mixed (although a fad for the pantomimic style has recently developed). Literary narrative can be more or less purely mimetic: stories can be written consisting solely of dialogue, for example.

So a central consideration for the theory of narrative is the transmitting source which is postulated. By 'transmission' I simply mean the class of kinds of narrative presentation which includes as its two subclasses showing and telling (always remembering that *narrative* showing is different from, say, theatrical showing). We can distinguish two broad categories, according to whether or not there is an explicit narrator, and if there is, whether his existence is obvious, that is overt, or covert. This distinction is often subsumed under the term 'point of view', but it is clear that that term can be seriously misleading and so will be avoided in the present work.

The initial question, then, is whether a narrator is present, and if he is, how his presence is recognized and how strongly it is felt by the audience. The narrator comes into existence when the story itself is made to seem a demonstrable act of communication. If an audience feels that it is in some sense spoken *to* (regardless of the medium), then the existence of a teller must be presumed. In other cases, the audience feels that it is directly witnessing the action. Naturally, in all but the scenic arts - like drama and the ballet - pure mimesis, that is, direct witnessing, is an illusion. The question, then, is how this illusion is achieved, by what convention does a reader, for example, accept the idea that it is 'as if he were personally on the scene, though the fact is that he comes to it by turning pages and reading words. It is clear that the author must make special efforts to preserve the illusion that the events are literally happening before the reader's eyes. And it is only very recently - within the last hundred years - that attempts at a purely 'dramatic' narrative have been made.

That it is essential not to confuse author and narrator is now a commonplace of modern criticism. As Monroe C. Beardsley argues, '... the speaker of a literary work cannot be identified with the author - and therefore the character and condition of the speaker can be known by internal evidence alone - unless the author has provided a pragmatic context, or a claim of one, that connects the speaker with himself.'³ And even in such a context, it is preferable to speak not of the author, but of the 'author', or even better, ' "author"-narrator', for he is simply one of the possible kinds of narrators. The 'author'-narrator is never equivalent to the flesh-and-blood Dickens or Hemingway or Fielding. If he were, we could not account for the inevitable discrepancies between the values and ideas and experiences of authors as we know them from biographies, and the values, ideas and experiences implicit in their works. Or between two works by the same author, between the 'Fielding' of *Tom*

Jones and the 'Fielding' of *Jonathan Wild*, or *Amelia*. These considerations have suggested the utility of a term like Wayne Booth's 'implied author':

As he writes (the real author), creates not simply an ideal, impersonal 'man in general' but an implied version of 'himself that is different from the implied authors we meet in other men's works — Whether we call this implied author an 'official scribe', or adopt the term recently revived by Kathleen Tillotson — the author's 'second self' - it is clear that the picture the reader gets of this presence is one of the author's most important effects. However impersonal he may try to be, his reader will inevitably construct a picture of the official scribe who writes in this manner - and of course that official scribe will never be neutral toward all values.

He is 'implied', i.e., he is a construction or reconstruction by the reader, and he is not the narrator, but rather the man who invented the narrator (if there is one), in short, the man who stacked the cards in this particular way, who had *these* things happen to *these* people. The distinction is particularly evident in the case of the 'unreliable narrator' (another of Booth's happy coinages). What makes a narrator unreliable is that his values diverge strikingly from that of the implied author's; that is, 'the norms of the work' conflict with the view of the events and existents that the narrator is presenting, and we become suspicious of his sincerity or competence to tell the 'truth'. The implied author can be at virtual odds with his 'author'-narrator. There is always an implied author, though there might not be a single real author in the ordinary sense (i.e., the narrative may have been composed by committee, by a disparate group of people over a long period of time, as were many folk ballads, by random-number generation by a computer, or whatever). And what establishes the character of the implied author is the moral and other norms of the work taken as a whole.

Our sense of the implied author includes not only the extractable meanings but also the moral and emotional content of each bit of action and suffering of all of the characters. It includes, in short, the intuitive apprehension of a completed whole; the chief values to which this implied author is committed, regardless of what party his creator belongs to in real life, is that which is expressed by the total form.⁷

Preliminary to any discussion of the structure of discourse in literary narratives is an understanding of the linguistic and linguistic-philosophical basis for reports of speech, thought, physical action and so on, since it is at least partly on these grounds that the reader makes his decision about who is speaking, thinking or whatever, and in particular whether there is an express narrator or not.

The clearest evocations of a narrator are, of course, direct intrusions, the use of the personal pronoun *I* or epithets like 'the author', or 'your narrator' and so on. Others (to be discussed below) are, rather, inferential: statements interpreting a character's behaviour or action presuppose an interpreter, hence a narrator. (To say that it is the 'author' - i.e. the implied author - is simply to say that he elects to appear as a narrator.) General commentaries on fate, the nature of the world or whatever presume a commentator, hence, again, a narrator. And so on. Somewhat less obvious are simple descriptions of a character's action or state of being. 'John sat in a chair' might in some sense be taken as the issue of a narrator's voice since John would not ordinarily be thought of as *saying* those words to himself. In this instance he would hardly verbalize to himself what he was doing. The ordinary convention is

that a character is not verbally conscious of his location, or if he is, the consciousness would not take the bald form of mentally speaking the words 'I sat in the chair.'

There is then a set of sentences which by their form as well as content may be identified as utterances of a narrator. Clearly distinct from these are sentences attributable to the voices (external or internal) of characters, whose forms are more numerous and complex than is usually assumed. It is essential to be clear about them, since they are the elements of any discussion of the structure of literary narrative that pretends to exactness.

A convenient basis for such distinctions is provided by a recent movement in philosophy called 'speech act' theory. This is not linguistics in the strict sense: it is not concerned with the grammatical composition of sentences in a language, but rather with their role in the communication situation, particularly in their function as actual acts by speaker. We owe the theory to the English philosopher John Austin.⁸ According to Austin, the intention of sentences - what he calls their 'illocu-tionary' aspect - is to be sharply distinguished from their grammatical, or 'locutionary' aspect, and from the effect which they achieve on the hearer, or 'perlocutionary' aspect. Thus, when a speaker utters a sentence in English (or any natural language), he is seen as doing at least two, and possibly three things: (1) he is making that sentence, that is, forming it according to the rules of English grammar, and (2) he is performing a quite separate act *in* saying it, an act which might equally be performed by non-linguistic means. For example, if he says 'Jump into the water', he is performing (1) the locution 'Jump into the water' according to the standard English rules for imperative constructions. At the same time, he is performing (2) the illocu-tion of *commanding*, an act corresponding in some way to non-linguistic acts like pushing his interlocutor toward the water. If he accomplishes the intention of the illocution, in this case if he succeeds in getting his interlocutor to jump into the pool, he has performed (3) the perlocution of *persuading*. Note that perlocution, if it occurs, is the same whether the illocutionary, or not.

Perhaps the best way to distinguish that they are not cross-determined is to

between these categories and to show set up an illustrative table. Take, for example the illocutionary act of 'predicting':

Locution 'John	Illocution	Locution	Illocution	Possible P
will doubtless go mad	predicting	persuade the interlocutor	irritate frighten amuse etc.	
'It is probable that John will ultimately be crazy'		'John will doubtless go mad'		
'John's insanity probably will manifest itself etc.'		deceive		
is probable that John will ultimately be crazy'		I		

That is, any given illocution, say, prediction, can be couched in any one of a number of locutions, using different syntactic and lexical elements. At the same

time, the illocution might give rise to a bewildering variety of effects, that is, perlocutions in the interlocutor (including no effect at all), depending upon the context and the interlocutor's relationship to the particulars of the utterance.

It is now possible to go into greater detail concerning the illocutionary definition of literature and hence of the distinction between fictive and nonfictive narration, proposed by Richard Ohmann. Ohmann's thesis¹⁰ is that 'a literary work' (for our purposes 'a fictive narrative') is a discourse abstracted, or detached from the circumstances and conditions which make illocutionary acts possible; hence it is a discourse without illocutionary force. Or more exactly with *pretended* illocutionary force: 'Specifically, the reader constructs (imagines) a speaker and a set of circumstances to accompany the quasi speech-act, and make it felicitous.' The illocutionary force, then, is only 'mimetic', i.e., purportedly imitative:

... a literary work *purportedly imitates* (or reports) a series of speech acts, which in fact have no other existence. By doing so, it leads the reader to imagine a speaker, a situation, a set of ancillary events, and so on. Thus one might say that the literary work is mimetic in an extended sense also: it 'imitates', not only action (Aristotle's term), but an indefinitely detailed imaginary setting for its quasi-speech-acts.

Having asserted this, Ohmann goes on to distinguish between, among other things, fictive and non-fictive narratives:

Notice that the imaginary speaker and his circumstances may be very dimly implied, as in a novel with an omniscient, third-person narrator. Nonetheless, a novel is mimetic of a narrative account, rather than simply *being* a narrative account, like Capote's *In Cold Blood*. Of the latter it makes sense to ask all the questions implied by Austin's rules (e.g., Is the particular person speaking appropriate for the invocation of the particular procedure invoked? Does he really have the thoughts or feelings invoked? Will he or the reader actually intend to conduct himself according to the thoughts and feelings invoked? Etc.)...

But this procedure obviously will not be appropriate to a novel or to a poem.

Thus throughout the following discussion, the expressions 'purported' or 'pretended' should be assumed to precede 'speech act' or 'illocution' insofar as the discussion turns on fictive rather than historical narratives.

The theory of speech acts provides a very useful tool for the analysis of the sentences of literary narrative. We may divide these sentences into two broad classes: those which are the speech acts of the narrator vis-a-vis his narrative audience; and those of characters vis-a-vis each other. To illustrate, consider the first several sentences of Dostoevsky's *Brothers Karamazov*:

Alexey Fyodorovitch Karamazov was the third son of Fyodor Pavlovitch Karamazov, a landowner well known in our district in his own day, and still remembered among us owing to his gloomy and tragic death, which happened thirteen years ago, and which I shall describe in its proper place. For the present I will only say that this 'landowner' -for so we used to call him, although he hardly spent a day of his life on his own estate -was a strange type, yet one pretty frequently to be met with, a type abject and vicious and at the same time senseless. But he was one of those senseless persons who are very well capable of looking after their worldly affairs, and apparently, after nothing else.

There is a considerable amount of story information ('story' in the technical sense, as defined above) communicated by these three opening sentences, and it is conveyed

in different ways by the actual syntax, but in every case the speech acts are those of a narrator.¹¹ For instance, the following existence statements may be inferred from the first sentence. From the illocutionary point of view these are narrative 'assertions' or the like:

There was a man named Alexey Fyodorovitch Karamazov.
 There was a man named Fyodor Pavlovitch Karamazov.
 Alexey was the third son of Fyodor. Fyodor was a
 landowner.

They are 'assertions' in a logical sense of the word, that is, 'a' is said to be 'b', where both 'a' and 'b' are entities (or, grammatically, nouns). Other existence statements are, illocutionarily, 'descriptions' (or 'attributions') that is, a quality (in the predicate) is attributed to an entity which is subject.

He was a strange type.
 He was abject and vicious, yet senseless.
 He was capable of looking after his worldly affairs and after nothing else.

Certain other statements or parts thereof, though they might appear superficially to be process statements, seem to be better analysed at the narrative level as existence statements and illocutionarily as descriptions:

Fyodor was well known in our district in his day.
 Fyodor is still remembered among us.

In the early versions of transformational grammar, passive constructions were derived from their active counterparts, the first from 'People in our district knew him well in his day', and 'We still remember him', or the like. But fundamental narrative units - the story statements - are not to be equated simply with the underlying deep structures of sentences. On the contrary, the transformations whose effects appear on the surface linguistic manifestation of literary narratives may be clearer indications of the narrative structure. Here, whatever their derivation, the items 'known' and 'remembered' are clearly meant to point to qualities or traits attributed to Fyodor, in the same way as 'notorious' might have been applied, or as 'strange, abject, vicious and senseless' actually are.

Similarly, the narrative function of 'We used to call him a "landowner"' and 'He hardly spent a day of his life on his own estate' is less one of action than description. The point for the *story* resides less in the fact that we *called* him a 'landowner' (though the use of the first person plural does give rise to some interesting secondary questions at the level of discourse), than that he was usually so-called, that is, that that was one of his attributes. As in the first sentence, the point of the second is that he was not concerned with the welfare of his estate, he was not industrious, prudent, or whatever. That these are *narratively* existence statements of traits despite their appearance in action sentences is also communicated by the occurrence of habitual forms - 'used to' and (the negative) 'hardly'. Such words also suggest the primacy of description, since the repetitions of the same actions in narrative clearly tend to characterize rather than to advance the plot.

'Owing to his gloomy and tragic death', on the other hand, however much it may relate syntactically to structures like 'His death was gloomy and tragic' does not have a primarily descriptive function. Rather, it states an event, the manner of which is, in the unfolding of the plot, secondary to the event itself; thus a narrative-statement paraphrase might be something like *He died gloomily and tragically*. (I am not, of course, presuming to rewrite Dostoevsky, but simply to highlight the purely narrative aspect of these sentences.)

There occurs in this passage still another category of speech acts that asserts neither actions nor description but does something that might be called 'generalizes' or 'opines'. This turns up in segments like 'yet one pretty frequently to be met with' and 'he was one of those senseless persons who...'. The second may seem to take of the form of assertion, say 'There exists a class of senseless persons who...'. But it differs in an important way from a clear-cut narrative assertion like 'There was a man named Fyodor Pavlovitch Karamazov'. A true narrative assertion is always integral to the story, and cannot be questioned by a reader, since to do so is to prevent the narrative from proceeding, to deny its very fabric. The author must be granted, by convention, the right to posit all those entities and actions necessary to his narrative. But assertions which are opinions do not have this warranty: they refer to the narrator's view of the world at large, not to the infraworld of the story, and the reader can immediately recognize this departure from the necessities of that infraworld. When the narrator says that there are persons who are senseless and yet capable of looking after their affairs, and that such fellows are frequently met with, he is presumably referring to the real world, the world outside the fiction; such fellows could be met on the streets of Moscow. Since it bears on the outside world, an 'opinion' in the strict speech-act sense makes an apparent truth-claim; one can reasonably ask whether the narrator is right or wrong on independent grounds. But it would not be meaningful to ask whether there was or was not such a person named Fyodor Pavlovitch Karamazov. The same point can be made about the difference between descriptive opinions, like 'Such a class is frequently met with...' and genuine descriptions like 'He was vicious', and so on. A statistical survey of personality types of the nineteenth century is a logical possibility; but since no claims that Fyodor ever existed can be made, it is impossible to judge whether or not he was vicious.¹² The speech-acts of *characters*, on the other hand, tend to be different. Although a character can, of course, tell a story within the main story, most of his speech acts will be appropriate to that actual framing scene and those will have all the variety in the (imagined) world: that is, his speech acts, like his other acts, will be addressed to the other characters and objects around him. So he enters into a wider set of relationships than do the narrator and the (implied) reader. To give just two brief examples: When Clarissa Harlowe in Richardson's novel writes 'I beg your excuse for not writing sooner,' the purported illocution is *apologizing*. When her mother writes 'I cannot but renew my cautions on your master's kindness,' there is a *warning*. And so on. Now of course a narrator can - and Fielding's narrators often do - apologize and warn. But they can only perform these acts in relation to the present situation, namely the narrative relationship which they have with their reader - they can only apologize or warn about the narrative itself, if they are to remain merely narrators. In Book II of *Tom Jones*, Fielding performs the speech act of *stating an intention*, but the intention is clearly in reference to the narrative:

Though we have properly enough entitled this our work, a history, and not a life; nor an apology for a life, as is more in fashion; yet we intend in it rather to pursue the method of those writers, who profess to disclose the revolutions of countries, than to imitate the painful and voluminous historian.. Now it is our purpose, in the ensuing pages, to pursue a contrary method. When any extraordinary scene presents itself (as we trust will often be the case), we shall spare no pains nor paper to open it at large to our reader; but if whole years should pass without producing anything worthy his notice, we shall not be afraid of a chasm in our history; but shall hasten on to matters of consequence, and leave such periods of time totally unobserved.

And it is clear that such passages must always be ancillary to the central speech-act function of a narrator, namely to narrate. That cannot be a character's central function, for then he would become a narrator (a 'character-narrator' to be sure). Rather, characters use language to argue, to make love, carry on business, rhapsodize, cogitate, promise, make commitments, lie, and so on, always within the boundaries of the Active world of the story.

Of course, it is possible to introduce illocutionary anomalies; consider the following passage from Samuel Beckett's *Watt*:

And then to pass on to the next generation there was Tom's boy young Simon aged twenty, whose it is painful to relate

? and his young cousin wife his uncle Sam's girl Ann, aged nineteen, whose it will be learnt with regret beauty and utility were greatly diminished by two withered arms and a lame leg of unsuspected tubercular origin, and Sam's two surviving boys Bill and Mat aged eighteen and seventeen respectively, who having come into this world respectively blind and maim were known as Blind Bill and Maim Mat respectively, and Sam's other married daughter Kate aged twenty-one years, a fine girl but a bleeder (1), and her young cousin husband her uncle Jack's son Sean aged twenty-one years, a sterling fellow but a bleeder too...

To the word 'bleeder' Beckett has appended the following footnote: '(1) Haemophilia is, like enlargement of the prostate, an exclusively male disorder. But not in this work.' Richard Ohmann's interpretation of the anomaly is worth quoting *in ex tenso*:

Since our narrator has just told us that Kate is a bleeder, it is at best quixotic for him to inform us now that such a condition is medically impossible, and then to step out of his role *within* the novel altogether. What shall we say of the text? It is not exactly contradictory, since the statement about poor Kate is made within the Active world of the novel, while that about haemophilia is outside it. (In this respect, the passage is akin to G. E. Moore's paradox - that one cannot say 'It's snowing, but I don't believe it's snowing.') Nor is it pertinent to say that the narrator has violated truth conditions: we don't *expect* a novel to tell truth in this sense. And certainly there is nothing syntactically wrong with the anomalous sequence. Yet I imagine many would share my feeling that what Beckett has written here is not simply unusual, or bizarre, or irregular, but un-English. That is to say, the passage violates some tacit rule for conducting discourse in English, some common understanding about how we will talk with one another. This understanding is perhaps roughly analogous to the rule violated by 'whose it will be learnt with regret beauty,' rather than to the expectations that make 'a sterling fellow but a bleeder' surprising.

He analyses the anomaly by reference to the concept of that kind of speech act which Austin calls 'performative', a particularly pure speech act since it asserts nothing true or false, but simply performs the act in question. Where the performative is a 'statement', its requirements are something like the following:

To make a *statement* felicitously, I must, among other things, utter a declarative sentence (criterion 1). I must be the right person to make the *statement* (2). I will not get away with *stating* that a memory of your grandfather just crossed your mind. I must not mumble (3) or break off in the middle (4). I must believe what I say (5), and I must not ground my future conduct or speech in a contrary understanding of the state of the world (6).

Ohmann goes on to show that Beckett's footnote does not in fact satisfy these requirements:

It is here that the Beckett passage goes awry. Either it fails on rule 5, in that the narrator holds an improper set of beliefs for the act of stating that Kate was a bleeder, or it fails on rule 6, in that he comforts himself inappropriately afterward - namely, in writing the footnote. So one or the other of his statements is infelicitous - breaks the contract that exists between writer and reader. The second sentence of the footnote compounds the breach. For behind the act of stating is the all-encompassing illocutionary act of telling a story, and, by rule 5, the teller always endorses the Active world of the story for its duration, and, again by convention, does not acknowledge that it *is* a fiction. When Beckett's narrator admits a discrepancy between his Active world and the real world, he violates both rules. Hence he sets the reader at odds with the text, in a way that produces disorientation and amusement, but which, on a deeper plane, calls into question the very possibility, or at least the reasonableness, of building narratives or trying to make sense of human conduct, or indeed, maintaining a society.

This strikes me as an illuminating analysis, acceptable in every detail except the argument that the discrepancy is linguistic, that the anomaly is 'un-English'. I don't dispute it in the trivial sense that the anomaly could equally occur in German or Swahili, since I take Ohmann's 'un-English' to mean something like 'unlinguistic', but I would argue that it is not only unlinguistic, but 'unnarrative', since such an anomaly could be communicated even in another discursive medium. Consider, for example, trick photography in the cinema. Now it is perfectly conceivable that a trick-shot should occur - say a man flying unaided through the air - which is denied by the rest of the film (it never happens again, or no character sees it, or if one does, he simply shakes his head and dismisses it as 'seeing things'); yet the act may be perfectly 'true' in some deeper sense of the film's meaning. Wouldn't that be a parallel to Kate's being a bleeder in this fiction, even though that is not possible in the real world? Since there have been films made without words, without even captions, we must conclude that the anomaly is not in the language but in the discourse. To say that something is 'unnarrative' is simply to say that the discourse has introduced elements which are contradicted by reference to the ordinary laws of nature, and moreover that these have been called attention to within the work itself. As Ohmann points out, the narrator is here expressly withdrawing his 'endorsement' of the fictive world. However, it is not enough to say that he has violated rules and leave it at that. What has happened is that he has expanded into another kind of discourse, a kind of ironic narrative or narrative *manque*, a narrative 'calling into question the building of narratives' which creates its own discursive form.

Fundamental to any analysis of the complex relations between speech acts of the narrator (if any) and of characters is a purely linguistic description of the basic ways of communicating speech (external voice) or thought (internal voice). A basic distinction is that between quotation and report, or in the more traditional terms, 'direct' and 'indirect' style. The distinction between *oratio recta* and *oratio obliqua* has been a grammatical commonplace for centuries. It is usually formulated in terms of speech -the difference between ' "I have to go," she said' and 'She said that she had to go'. But obviously the same applies to quotations and reports of thinking: ' "I have to go," she thought' and 'She thought that she had to go'. It seems worthwhile to maintain this dichotomy, since, in narrative, speech and thought are significantly different actions.

The grammatical differences between direct and indirect styles are quite clearcut. In both cases there are two clauses: for clarity's sake I shall call the introductory clause the 'tag', and the second clause the 'report'. The tag is the clause doing the reporting or quoting (in the above case 'She said') and the report clause contains that which is reported or quoted ('I have to go' or 'She had to go'). The differences between the two involve (1) the tense of the predicate of the report clause ('have' becomes 'had'), and (2) the person of the subject of the report clause (T becomes 'she').

But there has grown up within the last century another distinction which crosscuts that between direct and indirect style, namely that between normal, or, as I call them, 'tagged', and 'free' style (*erlebte Rede*, *style indirect libre*). Free sentences are simply those with the tag clauses deleted: thus 'I have to go' is the direct free counterpart of both the direct tagged speech 'She said, "I have to go"' and of the direct tagged thought 'She thought, "I have to go"'; while 'She had to go' is the indirect free counterpart of indirect tagged 'She said that she had to go' and 'She thought that she had to go'. Or in tabular form:

	<i>Free</i>	<i>Tagged</i>
<i>Direct</i>		
Speech	I have to go	'I have to go,' she said
Thought	I have to go	'I have to go,' she thought
<i>Indirect</i>		
Speech	She had to go	She said that she had to go
Thought	She had to go	She thought that she had to go

(Or better 'It occurred to her that she had to go,' since 'She thought that she had to go' might be itself a free reduction of '[She said] that she thought that she had to go'.) It is clear that direct free speech and direct free thought are expressed identically and thus ambiguously, as are indirect free speech and thought. Further, there is an additional ambiguity implicit in such indirect free constructions as 'She had to go', which might equally issue from the voice of the narrator.

Though narrative discourse is ultimately couched in words, it is not identical or coterminous with the linguistic manifestation. For example, we must recognize that the choice between indirect and direct discourse - between 'John said that he was fine' and 'John said "I am fine" ' - is essentially discursive though its actualization happens to entail certain actual linguistic choices, for example 'that' vs. zero and 'he' vs. T. But other, nonlinguistic features are also part of discourse. For example, the presence or absence of quotation marks (punctuation systems are not part of the 'natural language' but a separate superimposed system). 'Dots of ellipsis'... showing change of time and

place is another example of a non-linguistic signal in literary narrative. Such dots are not part of the language, not even of the written language, in the sense that a punctuation mark is, for example, the question mark, '?', which correlates with syntactic divisions and may also be a sign for a phonological feature like rising intonation. The fact that 'dots of ellipsis' may be used for other purposes - to show suspension of a structure, or to connect a title with a page number in the table of contents - is beside the point. In some narratives it is a signal of 'abrupt transition in time and place'; in others it may be used in quite another literary discursive function, for example, Virginia Woolf's short story 'The Mark on the Wall', where it signals the breaking in of reality on the free associative fantasy of the protagonist-narrator. Another example of non-linguistic but discursive elements are the 'tears' to be found on several of the letters in *Les Liaisons dangereuses*, or of *Pamela*. They are part of the larger semiotic context, the communication situation. The essential thing is not to confuse narrative discourse and linguistic manifestation, between which there is no necessary correlation. Say that the author needs to express a certain action by John, for example, that John stole some money. Here the discourse is necessarily in the Process or Does mode. But the linguistic manifestation of such a narrative statement need not use a transitive verb at all. For example, the copula would work equally well: 'John's theft was in the headlines'. The discursive predication *Do* exists nonetheless; it is implicit in the noun phrase 'John's theft', and the mere surface manifestation, the actual choice of an English verb, is not significant at the narrative level.

So the expression 'process statements in the *Does* or *Happens* mode' must not be understood to mean any particular class of sentences in English or another language; it refers, rather, more abstractly, to a *narrative statement*, in the technical sense in which that term is being used. Narrative discourse may make use of the grammar of the language in ways that would be anomalous in other kinds of discourse. A short story by Truman Capote called 'A Christmas Memory' is narrated by the protagonist, who was a child during the story time but who recounts the events retrospectively as an adult. Thus the first sentences are 'Imagine a morning in late November. A coming of winter morning more than twenty years ago': the illocution is *invitation* or the like. But in the third paragraph, after a description of an old woman, the boy's distant cousin, who is the other main character, we read: 'The person to whom she is speaking is myself. I am seven...' Other kinds of discourse could not allow the juxtaposition of 'I am seven' and 'This happened to me over twenty years ago'. But the logic here is perfectly clear: the simple present tense is used as a 'dramatic present', in other words we are to read it as if we had been transported backward in time and were witnessing the events with our very eyes. Or as if we were at a theatre (the next best thing), the narrator first appearing before the curtain and saying 'Imagine - so-and-so', and then stepping back as the curtain opened to reveal the very scene (though he will come back on-stage and continue to talk to the audience, standing immediately 'behind' the small boy).

A similar phenomenon is the use of the preterite with adverbs of present time: 'of course, she *was coming* to the party *tonight*'.

Much more could be said about the linguistic basis of literary narrative structure. But my ultimate goal is a description of the variety of narrative transmission. A logical way to proceed, I think, is from structures with the least presumption of a narrator's presence - that is, 'transcripts', through those where the narrator is indirectly present - to those in which he is not only present but highly vocal in his own person. I have

space here for only the first end of the spectrum; I shall take up the question of more obvious intervention by narrators in a later paper.

First, an important theoretical presumption. Throughout, my discussion is based on the notion of the freedom of discourse *features* to combine in various ways, rather than that of homogeneous and fixed genres (although a rough generic classification will serve as a basis of organization). By discourse feature I mean a single property of the narrative discourse, for example, the use of the first person singular, or the use or non-use of time summary. Variety among narratives is thus accounted for in terms of various mixtures of independent features, not by an endless proliferation of categories or a Procrustean reduction of instances into normative types. Literary theory in general and narrative theories in particular have suffered from too powerful reduction into a small number of genres, with the consequence that the full discursive complexities of individual cases are missed because they don't 'fit' or get interpreted somehow as exceptional, or even worse, aberrant. The problem can be illustrated by reference to a recent book of F. Stanzel. Stanzel reduces narrative discursive structure - what he calls the 'narrative situation' (*Erzdhlsituationen*) - to three types, 'authorial', 'first person' and 'figural':

If the author emerges by addressing the reader, by commenting on the action, by reflections, etc., the reader will bridge the gap between his own world and fictional reality under the guidance, so to speak, of the author. This is *authorial* narration. If the reader has the illusion of being present on the scene in one of the figures (characters), then *figural* narration is taking place. If the point of observation does not lie in any of the novel's figures, although the perspective gives the reader the feeling of being present as an imaginary witness of the events then the presentation can be called *neutral*.

Examples are *Tom Jones*, *Moby Dick*, and *The Ambassadors*. He tries to account for non-canonic cases (of which there are an 'endless number', a 'continuous, ever-changing series',) by means of the following model:

Mixed forms are explained as occupying midway positions on the circumference of the circle: '... the narrative situation of *Henry Esmond* (combining authorial and first-person forms) serves to prove that it is possible to realize intermediary forms which unite characteristic aspects of the surrounding novel types. But when we consider these intermediary forms in detail, we begin to run into difficulty, a difficulty that derives from two related problems: (1) the categories are not genuinely parallel; and (2) the model seems to insist that a form must be transitional between two poles only. Obviously a narrative might contain features characteristic of all three classes (if there are only three).

Let us consider Stanzel's categories as if they were composites of distinctive features of the kind used in linguistic notation - use of the third (or first) person pronoun, existence of a narrator, and presence of the narrator in the fictional or experiencing world, the world of the characters.

	There is a Narrator	Narrator is present in the fictional world		
Third person				
authorial	+	+	—	■
figural	+	—	■	—
first person	—	+	+	

We are immediately struck by the fact that these features are not as clearly formulated nor as independent as this sort of display implies. The 'third-person' column and 'first-person' row betray a basic equivocation in the theory, an indication that the analysis hasn't gone far enough to uncover the really basic elements. In saying that the use of the first or third person is criterial, he is implying that the choice is made by each of the three narrative situations in the same way, for example, that the first person novel is narrated by a narrator who refers to himself in the first person, while 'The authorial novel is narrated in the third person'. But 'narrated in the third person' cannot be parallel to 'narrated in the first person'. In a first-person narrative, it is the *narrator* who is referred to by the first person. In an 'authorial' narrative it is the *characters* (including the hero) who are referred to by the third person. The narrator of *Tom Jones*, refers to himself in the first person and to Tom in the third; on the first page,

The provision, then, which we have here made is no other than *Human Nature*. Nor do I fear that my sensible reader, though most luxurious in his taste, will start, cavil, or be offended, because I have named but one article.

Even where Fielding introduces a third-person expression like 'the author', it is clearly a euphemism of no structural importance, a mere stylistic variant of T.

A similar point must be made about the figural form. Like other critics, Stanzel seems to be confused about who is actually speaking in a 'central consciousness' novel like *The Ambassadors*. He writes

The past perfect of the second verb can already be viewed from the experiential present of Strether: 'The Sunday of the next week was a wonderful day, and Chad Newsome had let his friend know in advance that he had provided for it. There had already been a question of his taking him to see the great Gloriani... (p. 133).' It subsequently becomes clear that this flashback represents a retrospection on the part of Strether. It takes place at the moment of his arrival at the home of the artist...

But 'on the part of Strether' is surely incorrect if Stanzel means that Strether is *saying* this to himself; this is *not* a free reduction of the indirect thought form 'And Strether remembered that Chad had let him know...' or the like. On the contrary, a narrator and only a narrator could utter this particular sentence; it is precisely a narrator's epitome of what was understood between Chad and Strether.

The mere use of the first or third person is not a particularly powerful feature for distinguishing discursive types. Both Molly Bloom and Ishmael refer to themselves as T, but that hardly justifies placing *Ulysses* and *Moby Dick* in the same structural category - precisely because Molly is not a narrator. Indeed there *is* no narrator at this point in *Ulysses*, a situation which Stanzel's tripartite categorization does not easily allow for. For if we put interior monologue in the figural category, 'figural' cannot be equated with 'third-person narration'. In short, 'Third-' and 'First-person'

are useless as features in themselves, without specification of the precise narrative element to which they refer.

The point of this critique of Stanzel is not to castigate the book, which I consider to be a useful contribution to our knowledge of narrative structure, but rather to demonstrate the difficulties of any system that reduces narratives to a limited number of set categories, in a taxonomic, rather than a feature kind of analysis. It is clearly preferable to consider the features separately, always allowing for a wide spectrum of possibilities of combination, and to think of the form of *any* narrative as built up out of its own congeries of features.

Since the narrator is a feature like any other and thus subject to dosage in any given narrative, a natural basis of discussion is the degree to which a narrative statement or a whole work presupposes his existence. The negative pole - the pole of pure mimesis - is that occupied by statements purporting to be direct transcripts of a character's behaviour. Properly speaking, in literature pure mimesis is only possible where that behaviour is only linguistic. The positive pole - the pole of pure diegesis - is where the narrator speaks in his proper voice, using the pronoun *T* or the like and expresses views which are not so much the story as his *view* of the story (interpretations, general or moral observations and the like).

The negative pole, the absolutely unmediated story or pure transcript or record, consists of nothing beyond the speech or verbalized thoughts of characters, omitting even such minimal marks of narrative presence as 'he thought' or 'he said'. The use of such tags, however, is not a strong indicator of narrative mediation, for the convention of 'he said' is not much more conspicuous than that of the use of separate paragraphs to indicate a change of speaker in dialogue or of the character's name followed by a colon in printed forms of plays. (As such it is a feature of *discourse* rather than of the medium.) Mediation does begin to appear when the tag employs certain 'interpretative' verbs - 'he surmised' or 'he insinuated', or the like. The minimal phrases 'he said' or 'he felt' present a kind of norm; they add nothing - they represent a minimal representation in the process mode.

Theoretically, quoted dialogue is the minimal case; the only necessary assumption is that the author has copied the speech of the character. What we have is something like the transcript of a sound recording. We cannot avoid the implication that *somebody* has done the copying, but convention has it that we forget the act of transcription and assume that the expression is a pure act of mimesis. Even this form entails a transformation, from the modality of oral to that of written speech; the 'purest' instance of unmediated witnessing would have to be that in which the quoted text purported to be itself written - a letter, diary or whatever - in which a character's sentiments were depicted. The 'implied author' then is only a compiler.

Somewhat more distant from the pure mimetic pole is the depiction of actions other than overt speech, involving internal processes - thoughts, feelings, sense impressions, and so on - as well as external but non-verbal movement. In the first, the convention is that the author can read and copy out into words what is going on in the mind of a character. This obviously presupposes a machine somewhat more complex than a sound recorder - a machine for reading thoughts (including perceptions, sensations, unarticulated feelings), and putting them into linguistic form. It is not only the impregnability of the skull that makes this transcription difficult, but also the fact that a certain amount of mental activity is non-verbal and therefore

verbal depiction entails the same minimal necessity for interpretation as does the depiction of more overtly visible non-verbal behaviour.

Obviously, written narrative cannot directly imitate physical actions - like sitting down - the way drama does. When an actor sits down he imitates with the movements of his body the character's movements as he interprets them - it is he, not the playwright, who embodies the character. He performs the more immediate mimesis. And, as I have suggested, mediation always opens the possibility for interpretation: when we read in a narrative 'John fell into the chair' or 'John lounged about', there is obviously more than a mere imitation in words of John's action - there is a hint at least of a comment on that action. This is *logically* true to a certain degree even if the term is as neutral as can be - 'sat' rather than 'lounged'. Even 'sat' implies something, if nothing more than the fact that more loaded terms have been avoided: perhaps something like 'John *{simply}* sat down'. The convention has it that there is a scale of interpretation: more neutral words suggest an avoidance of intervention. The bare description of physical action is felt to be essentially non-mediated. We make such assumptions as long as we feel that the implied author has done his best to avoid judging or commenting upon, interpreting (or whatever) the action. What these verbs precisely entail may not always be possible to specify, but, clearly, certain words and grammatical structures imply such judgement and others do not: for example, 'lounged' instead of 'sat'. Or syntactically, the whole class of sentence adverbs, which necessarily entail a speaker's judgement on the content of the sentence they modify: for example, 'Obviously, John was tired,' which is possibly a transformation of 'It is obvious *to me, the narrator*, that John was tired', that is, 'I have judged the matter and found it to be thus and so'.

I cannot attempt here a detailed account of the various forms of mediated narrative transmission, and must content myself with a schema. The organization may be simple, proceeding from narratives involving *least* in the way of presuppositions about how the material reaches the audience to those presupposing the most. I am not presenting an airtight taxonomy of narrative types but simply (hopefully) logical characterization of *one* feature of the narrative, namely the narrator.

Written Records

Of all the forms of literary narrative, those imitating already written documents - like letters and journals - are most directly transcriptional. They reduce the implied author to a mere collector of documents; the only power he has is the narratively trivial one of collating the letters or editing the journal so that the typesetter could set the book. He is not even faced with the problem of transforming speech into writing, since he has before him the literal artifacts written by the characters; the only purported change is that of handwriting into print. He is not even a stenographer (with the stenographer's options about punctuation and so on), but merely a compiler. He may or may not make his presence known; if he does it is usually in the guise of 'editor' or the like.

The journal novel differs from the epistolary novel in respect to whom it implies to be the reader. The implied reader of a letter is the addressee and correspondent; the implied reader of a private journal is usually the writer himself. Its purpose is not informational but rather in the way of *aide-memoire* or assessment and analysis of his

developing situation. Like the letter-writer, and unlike the retrospective first-person narrator, the journal-writer does not know what will happen next, what will be the ultimate outcome of the plot.

Again, as in the epistolary narrative, the journal-writer may be a narrator, keeping track of events for his own edification and memory. But a simple transcription of things that have happened to him may not be his primary interest. Consider these passages from Sartre's *Nausea*; on the narrator's (Roquentin's) profession:

I don't think the historian's trade is much given to psychological analysis. In our work we have to do only with sentiments in the whole, to which we give generic titles such as Ambition and Interest.

On his own habits, seen at a neutral distance:

... there is something new about my hands, a certain way of picking up my pipe or fork. Or else it's the fork which now has a certain way of having itself picked up, I don't know _

In such contexts, when narrative does appear, it often serves the function of example:

... a little while ago, just as I was coming into my room, I stopped short because I felt in my hand a cold object which held my attention through a sort of personality. I opened my hand, looked: I was simply holding the door-knob.

It is interesting to consider some of the possibilities of the journal convention in other narrative media, for instance, the film. Robert Bresson's *Diary of a Country Priest* (1950), after Bernanos' novel, illustrates some of the possibilities. Especially at the beginning, brief shots illustrating the quality of the cure's daily life in his tiny vicarage are interlaced with shots of his hand writing the journal (his physical and mental distress frequently being reflected in the blottings or erratic handwriting). At the same time his own voice - rather a voice-over, since his lips do not move - reads what he is writing in the journal. The peculiar narrative flexibility of the cinema is illustrated by the fact that the journal can continue to be *read aloud* by the 'voice-over' effect, even when the visual image is not of the journal but of the action depicted by the journal at that moment. Thus the action that we see, in the present tense, so to speak, is the visual counterpart of what we hear, in the past tense, from the cure's lips. This leads to certain interesting effects. At one point, for example, his voice breaks off and says that he must write down immediately what is happening; then there is a cut immediately to an action, as the voice-over ceases. This leaves the audience a bit disoriented. Are we to assume that the action has suddenly gone ahead of the journal, that what was only future and incipient in the journal has become present and actual in the image: that is, is it that the narrative convention is suddenly broken? Or is this simply a flashback without journal specification (as elsewhere: the voice-over says 'I arrived home', then stops speaking and the action continues purely visually)? Only the context helps us to figure out that the former is the case.

Another interesting effect is utilized several times to show that the mind of the cure is unable to grasp what is being said to him (not only illness but naivete plagues him - he says plaintively at one point that he will never understand human beings).

What happens is this: the action is completely in the dramatic rather than the narrative mode, that is, the narrative voice-over is still. He is conversing with another character, the countess, for example; the camera is focussed on him as he listens to her speak, though it is her voice we hear. Then her voice suddenly becomes weaker, though still audible, and the *journal-voice-over* starts speaking conjointly with her voice, though louder, as it explains why he cannot understand what she's saying. The multi-channel capacity of the cinema has only begun to make use of these interesting special effects.

Speech Records

In the transcription of speech, the implied author is presumed to be nothing more than a stenographer. The unmediated record of speech can be that of a single character, the classic 'dramatic' monologue, or of two or more, that is, unmediated dialogue. In 'dramatic monologues' one character speaks to another, a silent listener (not to the 'reader', since there is no relationship established upon which this could be based). The essential characteristic of the dramatic monologue as of dialogue in general is that the speaker is *not* principally involved in recounting, since in that case, he would become a narrator, and the scene only the frame for a secondary narrative.

An example of rather pure dramatic monologue is Dorothy Parker's story 'Lady with a Lamp', the record of the speech of an unnamed character to her friend Mona, who is suffering a nervous breakdown and whom she is ostensibly trying to comfort but whom she only manages to make worse. The story begins and continues in the discursive technique of direct free speech:

Well, Mona! Well, you poor sick thing, you! Ah, you look so little and white and *little*, you do, lying there in that great big bed. That's what you do - go and look so childlike and pitiful nobody'd have the heart to scold you. And I ought to scold you, Mona. Oh, yes, I should so too. Never letting me know you were ill.

The expression 'I should so too' implies that at this point Mona has protested that she should not be scolded. Her verbal reaction never actually appears in print; but always is inferable from what her friend says.

I was mistaken, that's all. I simply thought that after - Oh, now, you don't have to do that. You never have to say you're sorry, to *me*. I understand.

(Mona's apology presumably interrupts the speaker at 'after'.)

You stay right the way you're lying, and I'll - Because you shouldn't move around, I'm sure. It must be terribly bad for you. All right, dear, you can move around all you want to. All right, I must be crazy. I'm crazy, then. We'll leave it like that.

(Mona presumably asks why she shouldn't move around, interrupting the speaker at 'I'll', to which the speaker responds 'Because...' Then, presumably, Mona disagrees, so the speaker acquiesces, saying 'all right'.)

At the end the speaker has so upset Mona that she becomes alarmed herself at the reaction:

Mona, don't! Mona, stop it! Please, Mona! You mustn't talk like that, you mustn't say such things.

(Mona has perhaps threatened to do herself in.)

Finally, in desperation, the speaker calls to Mona's maid, Edie, the change of interlocutor being visually indicated by putting the paragraph in italics:

Edie, Oh, Edie! Edie, I think you'd better get Dr. Britton on the telephone, and tell him to come down and give Miss Morrison something to quiet her. I'm afraid she's got herself a bit upset.

Obviously, the dramatic monologue is so special an effect that there must be some overwhelming reason for its employment. It is clear that in 'Lady with a Lamp' the notion of a character's moral and psychological obtuseness and even unconscious malice is supported by the technique of keeping her interlocutor - her victim -unheard. Thus content finds a direct formal counterpart in technique.

Dialogue is so commonplace and well-understood that little comment need be made. Practically every novel or story contains narratives made up in smaller or greater part or quoted speeches of one character to another. What does need to be recognized is that narratives that rely totally or predominantly on records of characters' speeches - whether monologues or dialogues - entail more inference than other kinds of narrative, or if not more, at least a special kind of inference. To a greater degree than normal, the reader is required to interpret the illocutionary force of the sentences that are spoken by the characters; that is, he is supposed to infer what they 'mean' in the context of the action, even if there are no direct reports of that action, indeed even if the whole action can only be constructed through such inferences. It's as if he were supposed to supply, metatextually, the correct verb tag - 'complained', 'argued', 'pleaded' or whatever - to characterize the speech act. Consider for example the following sentences from Hemingway's 'Hills Like White Elephants':

The girl was looking off at the line of hills. They were white in the sun and the country was brown and dry.

'They look like white elephants,' she said.

'I've never seen one.' The man drank his beer.

'No, you wouldn't have.'

'I might have,' the man said. 'Just because you say I wouldn't have doesn't prove anything.'

The girl first *poeticizes* or the like (italics for illocutions). The man may seem to be *admitting ignorance*, that is, at least, if the locution had occurred in another context; in this context, however, in response to the poeticism, the remark sounds more like a *rejection* of her flight of fancy, and is done with a hint of self-satisfaction. She then *criticizes* or *belittles* him. He in turn *defends* himself and *challenges her authority* to make judgements about him.

We make these inferences about speech-acts as we make all our inferences in reading - in terms of our ordinary knowledge of the world, our ordinary expectations of human behaviour in the society we know. That is perhaps why pure speech-report narratives are harder to understand across profound cultural borders.

Several narrative theorists have used the word 'soliloquy' to describe another sort of unmediated narration of speech, citing as examples such works as Virginia Woolf's

The Waves and Faulkner's *As I Lay Dying*. Is the transfer of the term to narrative structure useful? Is this a separate narrative category? Let us recall its meaning in the drama. The standard examples - Hamlet's and Macbeth's soliloquies - contain at least the following features:

- (a) the character does in fact speak (in the cinematic version, by a technical trick, his lips remain closed but we hear his voice);
- (b) either he is alone, on stage, or if there are others they show by their demeanour and actions that they do not hear him;
- (c) he traditionally faces the audience;
- (d) but he does not necessarily name the audience; the second person pronoun or the imperative, if used, are addressed either to himself or, in formal apostrophe, to someone not present ('Oh ye Gods,' or the like);
- (e) thus the audience is not being addressed, but rather overhears the character's address to himself or to someone not present;
- (f) the style and diction of the soliloquy tend to be very much of a piece with the character's ordinary dialogue; thus if he speaks in a formal and poetic manner to the other characters, that is the style of the soliloquy, too; there is no attempt to modify his language to show that it is an *inner* phenomenon;
- ig) the content often constitutes an explanation of or comment on the character's situation.

Features (a) and (b) are obligatory, the rest optional but usual.

Now in what sense can passages in narrative be called soliloquies? *The Waves* and *As I Lay Dying* do in fact exhibit some of these features.² In *The Waves* characters are said to *speak*: the tag 'he (she) said' is usually present, and passages attributed to each character are always in quotation marks:

'Susan has passed us,' said Bernard. 'She has passed the tool-house door with her handkerchief screwed into a ball. She was not crying, but her eyes, which are so beautiful, were narrow as cats' eyes before they spring. I shall follow her, Neville. I shall go gently behind her, to be at hand, with my curiosity, to comfort her when she bursts out in a rage and thinks, "I am alone".'

As I Lay Dying does not use tags, but name-captions are used to identify each speaker, as in a playscript.

DARL Jewel and I come up from the field, following the path in single file. Although I am fifteen feet ahead of him, anyone watching us from the cotton-house can see Jewel's frayed and broken straw hat a full head above my own.

In neither novel do other characters respond directly to the statements of the speaker; thus we infer that the others have not 'heard' them. Thus the form cannot be 'dramatic monologue' or the like. Though Bernard seems to be addressing Neville directly, there is nothing in Neville's next speech (which occurs no less than four pages and ten speakers later) to suggest an acknowledgement of what Bernard has said; indeed, there is no way of knowing whether Bernard is even present at the moment he speaks (the scenic sense is very weak in *The Waves* in any case):

'Where is Bernard?' said Neville. 'He has my knife. We were in the tool-shed making boats, and Susan came past the door....'

The same thing is true of *As I Lay Dying*; the only time there is an interchange between characters is when their conversation is reported by the soliloquizer, in which case the soliloquy itself has become a narrative within a narrative:

CORA ... 'She
ought to taken those cakes anyway,' Kate says.
'Well,' I say, 'reckon she never had no use for them now'. 'She ought to taken them,'
Kate says...

As for the optional features of soliloquy, discussed above, I cannot recall an instance where the reader is named or addressed in either *The Waves* or *As I Lay Dying*. In the rare cases that 'you' occurs in the former, it serves very much the apostrophe effect, as in Louis' speech upon finishing school;

'I am most grateful to you men in black gowns, and you, dead, for your leading, for your guardianship ...'

It would seem then that soliloquies can only occur in a tagged, never a free format, for the simple reason that they must be recognized unambiguously as speech, not thought, or rather as a stylized, expressionistic form beyond mere thinking or speaking. As we have seen there is no way of telling, if the tags are removed, which is operative. In this sense, *As I Lay Dying* is more ambiguous than *The Waves*, since only the name-captions are given, but no specification as to whether the named character thinks or speaks the words that follow. My own feeling is that we are to assume that these words are neither spoken nor thought naturalistically by the characters, but rather are attributed to them in some extra-naturalistic way. And it may be that the form of *As I Lay Dying* warrants the establishment of a category separate from speech records.

Records of Thought and Feeling

The representation of a character's consciousness may also be unmediated (although the very fact that it is revealed may imply a shade more mediation than in the strict speech record). But 'consciousness' as a concept in narrative needs careful examination. I can only present a brief sketch, and attempt to account for a few cases which are often lumped together, under terms like 'stream of consciousness'.

Without plunging into psychology, one can distinguish on the basis of simple introspection, for the purposes of narrative analysis, two kinds of mental activity: that which entails language and that which does not. ° I am sometimes conscious of *saying* to myself words like 'I must get milk and bread', but I am not ordinarily conscious of saying to myself as I pass a garden 'The rose is red' or 'See that red rose' or 'The redness of the rose'. It is the first kind of thinking, the kind that apparently is already present in the mind in verbalized form, that appears in narrative as unmediated thought in the strict sense. A visual medium like the cinema can

imitate a red rose directly, non-verbally, and it can show that it is the object of a character's perception by simple conventions, like first showing the character look offscreen, and then 'cutting' to the rose itself. The effect is equivalent to 'The character sees the red rose' or even, with contextual support, 'The character sees that the rose is red'. But literature is a verbal art, and even non-verbal sensations must be transformed into words; this inevitably raises the question of who is performing this transformation. But let us take these problems one at a time.

The most obvious and direct means of handling verbalized thoughts is to treat them as 'unspoken speech', placing them in quotation marks, accompanied by tags like 'he thought'. From *Pride and Prejudice*,

Elizabeth almost stared at her. - 'Can this be Mr. Darcy!' thought she.

According to the schema presented above, this is direct tagged thought: the tense of the report clause is present, not past as it would be in the case of indirect style. The implied author has become mind-reader, in addition to stenographer. But he is no more than that; he does not interpret; he takes down only the words - and the exact words, diction and syntax - as they are 'spoken' in the character's mind. As such the tense remains present, and self-reference to the character is expressed in the first person.

But it is very easy - and has long been commonplace in European fiction - to drop quotation marks, and more recently to drop the tag. The result is direct free thought. This is a form of presentation or enactment which in extended form has often gone under the name of 'interior monologue' or 'stream of consciousness'. The features which characterize this kind of presentation are:

- 1 The character's self-reference, if any, is in the first person pronoun.
- 2 Verb predicates, if any, are in the present tense.

There are three additional logical implications:

- 3 The language - idiom, diction, word- and syntactic-choice - are appropriate to the character, whether or not a narrator is also present.
- 4 Allusions to anything in the character's experience are made with no more explanation than would be needed in his own thinking, that is,
- 5 There is no presumptive audience other than the thinker himself, no deference to the ignorance or expository needs of a reader or another character.

Conditions one, two, and four are not, of course, unique to direct free thought; they apply equally to any form of unmediated speech - dramatic monologue, dialogue, and soliloquy (but not to indirect free thought and speech, which are mediated, albeit minimally and sometimes ambiguously so).

For an example of free direct thought it is appropriate to turn to Joyce's *Ulysses*, say the first chapter of Section II, where we first meet Leopold Bloom:

- (1) Mr. Leopold Bloom ate with relish the inner organs of beasts and fowls. (2) He liked thick giblet soup, nutty gizzards, a stuffed roast heart, liver slices fried with crustcrumbs, fried hencod's roes. (3) Most of all he liked grilled mutton kidneys which gave to his palate a fine tang of faintly scented urine.

- (4) Kidneys were in his mind as he moved about the kitchen softly, righting her breakfast things on the humpy tray.
- (5) Gelid light and air were in the kitchen but out of doors gentle summer morning everywhere. (6) Made him feel a bit peckish.
- (7) The coals were reddening.
- (8) Another slice of bread and butter; three, four: right.
- (9) She didn't like her plate full. (10) Right. (1) He turned from the tray, lifted the kettle off the hob and set it sideways on the fire. (12) It sat there, dull and squat, its spout stuck out. (13) Cup of tea soon. (14) Good. (15) Mouth dry. (16) The cat walked stiffly round a leg of the table with tail on high.
- (17) -Mkgnao!
- (18) - O, there you are, Mr. Bloom said, turning from the fire. (19) The cat mewed in answer and stalked again stiffly round a leg of the table, mewing. (20) Just how she stalks over my writing-table. (21) Prr. (22) Scratch my head. (23) Prr.
- (24) Mr. Bloom watched curiously, kindly, the lithe black form. (25) Clean to see: the gloss of her sleek hide, the white button under the butt of her tail, the green flashing eyes. (26) He bent down to her, his hands on his knees.
- (27) - Milk for the pussens, he said.
- (28) Mrkgnao! the cat cried.
- (29) They call them stupid. (30) They understand what we say better than we understand them. (31) She understands all she wants to. (32) Vindictive too. (33) Wonder what I look like to her. (34) Height of a tower? (35) No, she can jump me.
- (36) - Afraid of the chickens she is, he said mockingly. (37) Afraid of the chook-chooks. (38) I never saw such a stupid pussens as the pussens.
- (39) Cruel. (40) Her nature. (41) Curious mice never squeal.
- (42) Seem to like it.
- (43) Mrkgnao! the cat said loudly.
- (44) She blinked up out of her avid shameclosing eyes, mewing plaintively and long, showing him her milkwhite teeth. (45) He watched the dark eyeslits narrowing with greed till her eyes were green stones. (46) Then he went to the dresser, took the jug Hanlon's milkman had just filled for him, poured warm-bubbled milk on a saucer and set it slowly on the floor.

It is important to recognize that this passage, which is often cited as a standard example of 'stream of consciousness', only approaches free direct thought gradually. The first four sentences are straightforwardly narrated in conventional fashion, by an effaced narrator, whose existence is only known by the fact that the character is referred to in the third person and his actions represented in the past tense. Further, that such actions are summarized ('ate', 'liked') in the first paragraph posits a narrator who assumes somewhat more than the barest powers of observation - more than, say, the charge of the Hemingwayesque narrator. Joyce's narrator tells us what the character habitually did, and also verbalizes what we assume was only an un verbal-ized feeling in Bloom's own consciousness ('which gave to his palate a fine tang of faintly scented urine').

Joyce brings the narration into the present scene in the fourth sentence, preserving the narrator's right to pronounce upon the contents of the character's mind. The narrator continues to do so in the fifth, sixth and seventh sentences, although the truncated syntax (deletion of 'was' between 'morning' and 'everywhere' and of 'it' before 'made') hints at a move toward another kind of transmission.

That happens in sentence eight: 'Another slice of bread and butter: three, four: right'. Here the shift is to free thought; it is *not* the truncated syntax *per se* which makes it such, since we've already had that without a shift in transmissional mode, but rather the fact that, in context, any way we fill the syntax out will necessitate the recognition of ellipsis of the tag 'He thought'. In other words, it is not so much a question of whether this is short for 'I'd (or he'd) better prepare another slice of bread and butter' or 'It would be a good idea to have another slice of bread or butter' or whatever, but rather that regardless of the actual original content of that sentence, it is one that Bloom *thinks*. How do we know that? Simply because the word 'right' cannot be attributed to the narrator; it is Bloom's and not the narrator's word. In this context, the narrator could not possibly be imagined to be weighing the 'rightness' of Bloom's action; only Bloom can do so.

However, since so much is deleted, and in particular, the verb-tense, we cannot know if the mode is indirect or direct free thought. (The indirect form would be '(He thought) that was right', and the direct would be 'That's right (he thought)'). The verb tense, however, is kept in sentence nine, which establishes it clearly as indirect free thought. Ten is ambiguous again, but on the principle of inertia, we assume that it is indirect. Eleven and twelve resume the direct narration.

'Soon', however, brings us back to Bloom's mind: it is a word actually reverberating in his mind or *could be* so reverberating (which is the most we can ever assume in the style of indirect free thought), but again for lack of verb tense we can't tell whether it is direct free or indirect free - 'I'll have a cup of tea soon', or 'He'd have a cup of tea soon'. Similarly with fourteen and fifteen - 'That's good' or 'That was good', 'My mouth's dry' or 'His mouth was dry'. Fifteen resumes the direct narration, and seventeen and eighteen, of course, are dialogue, that is direct tagged speech. Nineteen is narration.

But twenty resumes the quotation of Bloom's mind: it is the first unequivocal instance of his free *direct* thought, since the verb is in the present tense ('stalks'). Twenty-one through twenty-three, of course, are Bloom's 'quotations' of what the cat says: the full form would be "'Purr. Scratch my head,' she's saying," he thought.' Twenty-four resumes the narration, while twenty-five goes back to the earlier ambiguous free style, without a verb. Twenty-six is narrative and twenty-seven and twenty-eight are direct tagged speech.

The next paragraph, sentences twenty-nine through thirty-five, is entirely in the direct free thought mode, with present tense verbs and first-person self-reference ('we', T). Thirty-six is direct tagged speech, continued in thirty-seven and thirty-eight by direct free speech.

The next paragraph, thirty-nine through forty-two, is again indeterminately free thought. The rest of the passage is narrated.

So we can see that it takes relatively little in the way of direct free thought (in this case slightly less than half of the sentences) to suggest strongly the effect of 'stream of consciousness'. And further that though fragmentary syntax, free association and the like may accompany this style, the only *necessary* condition is the technique of free direct thought, meaning the use of self-reference by first person pronoun and present tense verbs; for even where these have been deleted, they must be presumed.

The use of direct free thought in mixed passages of 'stream of consciousness' permits the same sort of irony between character and narrator as does the sustained limited third person, 'central consciousness' manner of *The Ambassadors* or *Madame Bovary*.

This is quite different from sustained indirect free style, where the effect is more often (though not necessarily) one of sympathy or identity of view between character and narrator. An example from the first page of Virginia Woolf's *Mrs. Dalloway*:

Mrs. Dalloway said she would buy the flowers herself. For Lucy had her work cut out for her. The doors would be taken off their hinges; Rumpelmayer's men were coming.

The communal or sympathetic mode is established immediately in *Mrs. Dalloway* by means of indirect tagged leading to indirect free forms. The first sentence of the novel is indirect tagged speech: 'Mrs. Dalloway said she would buy the flowers herself.' (Speech is hardly ever communicated this way in the 'stream of consciousness' chapters in *Ulysses*. When it occurs, it is almost always in the direct form, set off by Joyce's own peculiar punctuation - an initial dash instead of quotation marks). The difference is fundamental; it is not that the words *are* the character's words: only that they *might* be. By establishing the indirect report, Virginia Woolf prepares the way for indirect free statements which are indifferently attributable to either narrator or character; and this is what I mean by calling it a 'sympathetic' mode - narrator and character are so close, in such sympathy, that it doesn't matter to whom the statement is attributed; either could have made it:

For Lucy had her work cut out for her.

Either 'For you see, dear reader, Lucy had her work cut out for her,' (i.e. 'I, the narrator observe that'), or 'Mrs. Dalloway remembered that Lucy had her work cut out for her.' Indeed the ambiguity goes even further, since in respect to Mrs. Dalloway the form is indifferently speech or thought; it could just as well mean 'Mrs. Dalloway *said* that Lucy had her work cut out for her.'³ Since none of these is excluded, they all hover in suspension within the sentence, and there is established a sense that the narrator has not only access to but unusual affinity with the character's mind. She is part of an 'in'-group; we infer a communal form: 'It was understood by all parties (including the narrator) that Lucy had her work cut out for her.' And if we look back to the first sentence, we discover an interesting thing which prepares us for this consensus: Mrs. Dalloway is reported simply as saying she would buy the flowers, not as saying that to any particular person. It is a pronouncement, not a bit of dialogue. The implication again is communal, ridden with a sense of broader social context: Mrs. Dalloway is accustomed to having an audience, consisting of at least servants, attendants; the fact that it is not necessary, even in the first sentence, to specify her audience implies immediately that she regularly has one.

(The same kind of consensus operates at the beginning of Katherine Mansfield's 'The Garden Party': 'And after all the weather was ideal. They could not have had a more perfect day for a garden party if they had ordered it.' Indistinguishably the thought of one or all the family, or what one of them said to the others, or a report of the consensus of their attitudes, or the narrator's judgement - but which differs in no way from theirs.)

Thus the very narrative structure corroborates at the outset a fundamental distinction between *Mrs. Dalloway* and *Ulysses*: Mrs. Dalloway, the brilliant socialite, tied in so many ways to her society, always surrounded by people - husbands, friends,

daughters, ex-lovers, servants, and even a sympathetic narrator - as opposed to those loners, Stephen Dedalus and Leopold Bloom, living on the margins of their society (for different reasons, of course), in conflict with it, unable to communicate with it -except obliquely, at odd moments. And their narrator distant, objective, even at times ironic:

Mr. Leopold Bloom ate with relish the inner organs of beasts and fowls. He liked thick giblet soup, nutty gizzards, a stuffed roast heart, liver slices fried with crustcrumbs, fried hencod's roes. Most of all he liked grilled mutton kidneys which gave to his palate a fine tang of faintly scented urine.

The second sentence of *Mrs. Dalloway*:

The doors would be taken off their hinges; Rumpelmayer's men were coming.

Again the effect is communal: it is the common understanding that Rumpelmayer's men were coming. The future is conveyed by the past tense of 'will' and the past progressive 'were coming'. In *Ulysses*, on the other hand, the future only exists in the character's musings, and so is always in the present tense form (or in an elliptical non-finite verb form):

He heard then a warm heavy sigh, softer, as she turned over and the loose brass quoits of the bedstead jingled. Must get those settled really.

He pulled the halldoor to after him very quietly, more till the footleaf dropped gently over the threshold, a limp lid. Looked shut. All right till I come anyhow. He walked on, waiting to be spoken to, trailing his ashplant by his side. Its ferrule followed lightly on the path, squealing at his heels. My familiar, after me, calling Steeeeeeeeephen. A wavering line along the path. They will walk on it tonight.

The detachment of interior monologue vs. the sympathy of the indirect free style: Professor Dorrit Cohn has well expressed the sense of intimacy between narrator and character in the latter:

By allowing the same tense to describe the individual's view of reality and that reality itself, inner and outer world become one, eliminating explicit distance between the narrator and his creature. Two linguistic levels, inner speech with its idiosyncrasy and author's report with its quasi-objectivity, become fused into one, so that the same current seems to pass through narrating and figural consciousness.

At the same time, however, she shows that this is only one of the possibilities: the

narrator is, in a sense, the imitator of his character's silent utterances. This mimetic quality of the narrated monologue was repeatedly emphasized by its early theorists. Now imitation implies two basic possibilities: fusion with the subject, in which the actor identifies with, 'becomes' the person he imitates; or distance from the subject, a mock-identification that leads to caricature. Accordingly, there are two divergent directions open to the narrated monologue, depending on which imitative tendency prevails: the lyric and the ironic.³³

So consensus or sympathy and intimacy between narrator and character is not the only aesthetic artifact of indirect free style. Consider the ironies in this passage from

Madame Bovary which starts out as straight narrative and goes into indirect free style (ending up as direct tagged speech):

... Charles... attendit patiemment le retour de sa femme pour avoir des explications. Si elle n'avait point instruit de ce billet, c'était afin de lui épargner des tracasseries; elle s'assit sur ses genoux, le caresse... (etc.) - Enfin, tu conviendras que, vu la quantité, ce n'est pas trop cher.

Here the indirect free style supports rather the notion of the commonplaceness of Emma's action, how frequent an occurrence it was, how often she pulled the wool over Charles' eyes; and more generally the implication 'You know how it is done in petit-bourgeois circles.'

Indirect free style is one of the chief devices for indicating the speech and thinking of characters in partially unmediated narratives; it provides the structure for a middle ground of consciousness between total submersion in that consciousness, as in the 'stream of consciousness', and the Jamesian effect of relatively distanced observation by a narrator of a mediated 'central consciousness' or 'post of observation' - a topic for a later stage of this inquiry.

Notes

- 1 This article is a development of work on the narrative, begun in 'New Ways of Analyzing Narrative Structure', *Language and Style*, 2 (1969), pp. 3-36, and continued in 'The Structure of Fiction', *University Review*, 37 (1971), pp. 190-214.
- 2 The disabling ambiguity is discussed in an article by Sister Kristin Morrison called 'James's and Lubbock's Differing Points of View', *Nineteenth Century Fiction*, 16 (1961), 245-56. Sister Morrison shows that Lubbock and his followers used the term in the sense of the narrative perspective of the speaker (the narrator), that is, the inner workings of his mind; while James usually used it in the sense of the perspective of the knower or reader. Even more confusingly, the term often bears the non-literary sense of 'mental attitude or opinion' or 'interest' (as in 'From China's point of view, President Nixon's visit was very important'). To say that *The Ambassadors* everywhere presents Strether's 'point of view' is valid only if the latter sense is meant, for the speaker is clearly an outside narrator, and along with his *interpretation* of Strether's consciousness, he also gives us, sometimes ironically, his own view of Strether's situation.
- 3 Monroe C. Beardsley, *Aesthetics* (New York: Harcourt, Brace and World, 1958), p. 240. Compare Kathleen Tillotson, *The Tale and the Teller* (London: Rupert Hart-Davis, 1959), p. 22: 'The "narrator" ... is a method rather than a person; indeed the "narrator" never is the author as man; much confusion has arisen from the identification, and much conscious art has been overlooked. Writing on George Eliot in 1877, Dowden said that the form that most persists in the mind after reading her novels is not any of the characters, but "one who, if not the real George Eliot, is that second self who writes her books and lives and speaks through them." The "second self", he goes on, is "more substantial than any mere human personality", and has "fewer reserves"; while "behind it, lurks well pleased the veritable historical self secure from impertinent observation and criticism".'
- 4 Wayne C. Booth, *The Rhetoric of Fiction* (Chicago: University of Chicago Press, 1961), p. 72 makes an excellent observation: 'the author of *Jonathan Wild* is by implication very much concerned with public affairs and with the effects of unchecked ambition on the "great men" who attain to power in the world,' while 'the author who greets us on page one of *Amelia* has none of that air of facetiousness combined with general insouciance that we meet... in *Joseph Andrews*,' but rather imparts an 'air of sententious solemnity'.
- 5 Booth, pp. 70-1. Booth discusses the problem of finding a good term for this entity on p. 73.
- 6 These possibilities are suggested by Christian Metz, *Essais sur la signification au cinéma* (Paris: Klincksieck, 1968), p. 29.

- 7 Booth, pp. 73—4. At another point (p. 151) Booth states: 'Even the novel in which no narrator is dramatized creates an implicit picture of an author who stands behind the scenes, whether as stage manager, as puppeteer, or as an indifferent God, silently paring his fingernails... Insofar as a novel does not refer directly to this author, there will be no distinction between him and the implied, undramatized narrator; in Hemingway's "The Killers", for example, there is no narrator other than the implicit second self that Hemingway creates as he writes.' Here I must disagree: surely - if the terms are to mean anything at all - we must recognize the presence of the implied author, but not that of the narrator. Booth's term 'implied undramatized narrator' seems unnecessarily complex to describe what is nothing but the mere absence of a narrative voice. Why is it a 'mistake' typical of the 'unexperienced reader', as Booth claims, to assume that stories like 'The Killers' 'come to him unmediated' (p. 152)? Whatever mediation appears is surely that of the 'implied author', not that of a narrator: I assume that an example would be the fact that Nick and George and Henry are named from the outset (the reader 'knows' them even at the very first appearance) whereas the gangsters Al and Max are first 'the men', and the reader only learns their names as Nick, George, and Henry learn them, suggesting that the story occurs from the perspective of the latter. But the device of naming is surely that of the implied author, not that of the narrator. (I owe this example to Thomas O. Sloan.)
- 8 John Austin, *How to Do Things with Words* (New York: Oxford University Press, 1962). See also John Searle, *Speech Acts* (London: Cambridge University Press, 1969).
- 9 William Alston, in *Philosophy of Language* (Englewood Cliffs, NJ: Prentice-Hall, 1964), p. 35, proposes this as one of a number of other illocutionary acts, including reporting, announcing, admitting, opining, asking, reprimanding, requesting, suggesting, ordering, proposing, expressing, congratulating, promising, thanking, and exhorting.
- 10 Richard Ohmann, 'Speech Acts and the Definition of Literature', *Philosophy of Rhetoric*, 1 (1968).
- 11 For an interesting account of how literary information is communicated in sentences see Richard Ohmann: 'Literature as Sentences', *Essays on the Language of Literature*, ed. Seymour B. Chatman and Samuel R. Levin (Boston: Houghton-Mifflin, 1962), pp. 231-8. Ohmann analyses several sentences from literary texts in terms of their syntactic structures.
- 12 'Opining' is like the narrative function called 'referential' (or 'cultural' or 'gnomic') which Roland Barthes (*S/Z*, Paris: Seuil, 1970, p. 25) applies to passages like the following (from Balzac's 'Sarrazine'): 'J'étais plongé dans une de ces reveries profondes qui saisissent tout le monde, même un homme frivole, au sein des fêtes les plus tumultueuses'. ('Referential' in the sense that it permits the discourse to *refer outward* into the real world, to some kind of scientific or moral authority.) Note, again, the use of a certain kind of vocabulary that reveals the function, i.e. '*one of those* profound reveries that seizes *everybody*...'. And so on.
- 13 In *Literary Style: A Symposium*, ed. Seymour Chatman (New York: Oxford University Press, 1971), pp. 244-5.
- 14 Sometimes referred to as the 'verbum dicendi'; see, for example, Dorrit Cohn, 'Narrated Monologue: Definition of a Fictional Style', *Comparative Literature*, 18 (1966), 105.
- 15 See the bibliography in footnotes to Dorrit Cohn's article and that in Stephen Ullmann's 'Reported Speech and Internal Monologue in Flaubert', *Style in the French Novel* (London: Cambridge University Press, 1957).
- 16 Its generalized, non-specific semantic import is, thus, like the various transitions between shots in the cinema: the simple cut, the dissolve, the fade-out and -in, the wipe, and so on. These clearly 'mean', but they do not have specific meanings, i.e. in some contexts the dissolve may mean 'at a place and time considerably different from that represented in the previous scene (as opposed to the cut which usually signals a briefer span)' or 'in the mind of the character', or 'a new motif in the action', and so on.
- 17 Though it contains many excellences, David Lodge's *Language of Fiction* (London: Routledge and Kegan Paul, 1966) makes too much of the role of language in the narrative composite. There are other kinds of structures in narrative than linguistic, even though it is obvious, as Lodge urges, that 'the critic of the novel has no special dispensation from that close and sensitive engagement with language which we naturally expect from the critic of poetry' (p. 47). But language is no more basic than anything else that goes into the narrative. It is simply one of several systems, or codes, and there is no need to *rank* these, Aristotle to the contrary notwithstanding. Each code has its value, and different narrative styles highlight one system or the other. In James, language means a great deal, in Dreiser, relatively little.

- 19 Stanzel, *Narrative Situations in the Novel* (Bloomington: Indiana University Press, 1969).
- 20 Stanzel, p. 23.
- 21 Stanzel, p. 59.
- 22 Stanzel, p. 62.
- 23 The distribution in this column is identical for certain other features mentioned by Stanzel, like temporal posteriority of the narrator to the events of the fictional world, and power to compress or summarize those events.
- 24 Stanzel, p. 38. And later he speaks of 'the authorial narrator's characteristic reluctance to speak in the first person' (p. 69).
- 25 Stanzel, p. 107.
- 26 By the same token a purely physical act of this sort does not ordinarily presume consciousness on the part of the character, so that from the narrative-discursive point of view it is unlike a thought. Of course, 'John sat down' *may* mean that he not only sat down but that he was conscious of sitting down. But we assume that it doesn't, unless we have strong contextual evidence to the contrary, for example, where the mode is indirect free, so that every sentence bears a bit of the character's consciousness about it. However, many verbs imply in themselves an element of consciousness along with their physical aspects: verbs like 'wait', 'hand (something to)', and so on.
- 27 There is no point, I think, in limiting 'dramatic monologue' to poetry and excluding it from prose, merely because its earliest and most famous exponent was Robert Browning (as Melvin Friedman does in *Stream of Consciousness* (New Haven: Yale University Press, 1955), p. 26). A simple but useful definition appears in Joseph Shipley's *Dictionary of World Literature* (Paterson, NJ: Littlefield, Adams and Co., 1960), p. 273: 'The dramatic monologue is a character sketch, or a drama condensed into a single episode, presented in a one-sided conversation by one person to another or to a group.'
- 28 For example, Robert Humphrey, *Stream of Consciousness in the Modern Novel* (Berkeley and Los Angeles: University of California Press, 1959), pp. 35-8. For Humphrey, soliloquy is 'defined as the technique of representing the psychic content and processes of a character directly from character to reader without the presence of an author, but with an audience tacitly assumed' (whereas interior monologue does not acknowledge the presence of an audience). As I argue below, 'tacit assumption' should not be taken to mean that the character directly *names* the audience; rather, because he seems to be explaining or commenting upon what is happening or has happened and need not do so for his own sake, our presumption is that he is doing it for the reading audience.
- 29 Thus L. E. Bowling is incorrect in referring to *The Waves* as an 'interior monologue' novel: see 'What is the Stream of Consciousness Technique?', *PMLA*, 65 (1950), p. 339.
- 30 The distinction is well emphasized in Bowling, p. 342. Edouard Dujardin, *Le Monologue interieur* (Paris: Messein, 1931) uses the term 'monologue traditionnelle' to refer to this form, but this draws too close a parallel with theatrical monologue.
- 31 This 'triguity' among the possibilities - character's speaking voice or character's mental voice or narrator's voice - explains a line from Jane Austen's *Persuasion* that troubled David Lodge (*Language of Fiction*, p. 15): 'He had always been lucky; he knew that he should be still.' Lodge writes 'We seem to be hearing him speaking to Anne, or to himself.. This is not obvious, but is, I think, indicated by the word *knew*. If the narrator's voice were speaking with full authority here, some more guarded word like *thought*, *supposed*, *believed* would have been used.' But the triguity would persist there too; the real source of it is the deletion (if there is such) of a possible *earlier* tag 'say': Is it 'He *said* that he knew that he should be still' or simply 'He knew that he should be still' (and if the latter, does it mean 'He knew: "I shall be still", or 'I, the narrator, report that he knew he should be still (whether, perhaps, he was conscious of *saying* that to himself or not)')?
- 32 Cohn, p. 99. Others have also noted this effect: see, for example W. J. M. Bronzwaer, *Tense in the Novel* (Groningen: Wolters-Noordhoff Publishing, 1970), ch. III, who uses the term 'emphatic'.
- 33 Cohn, pp. 110-11.

Rhetoric, Phenomenology, Reader Response

Introduction: Language and Action

Julie Rivkin and Michael Ryan

In this section, we bring together two sides of the equation of reading - the production of language acts known as rhetoric and the reception of such acts in reading and interpretation. The dialogic structure of the literary text requires that both sides be taken into account. Rhetoric, the formulation of language for readers, invites and solicits a response from readers.

In ancient Greece and Rome, language was recognized as an important feature of social and political life. Training in how to think properly took the form of training in how to use language effectively. Logic, the right use of such mental processes as induction and deduction, was studied in conjunction with rhetoric, the use of forms to give shape to language and the use of language to make argumentative points and attain emotional effects. In the modern period, the rise of a positivist model of science and the development of more refined forms of abstract mathematical logic eroded the link between philosophy and rhetoric. A study of the forms, tropes, topics, and genres of discourse was no longer considered sufficient for gaining an understanding of how thinking worked or of how far logic could be extended and elaborated. Rhetoric receded in importance in the humanities. Some literary scholars, like Kenneth Burke in the 1930s, still spoke of the importance of rhetoric for an understanding of social action and literary form, but they were few in number. The intellectual movement called Positivism, which favored scientific method and the study of positive facts, displaced rhetoric from its central place in the humanities in education.

One of the major intellectual revolutions of the twentieth century consisted of restoring importance to the study of language. It began in linguistics and carried over into anthropology, philosophy, and the literary criticism of the Russian Formalists and the French Structuralists. Continental philosophers, such as Ernst Cassirer and Martin Heidegger, were among the first to argue for the centrality of language to human experience and to social institutions. Language philosophers in England, such as Ludwig Wittgenstein and J. L. Austin, noted that human knowledge takes place in language and that language is central to human social activity. In conjunction with these intellectual movements there arose a new interest in rhetoric on the part of literary scholars in the mid to late twentieth century.

The work of J. L. Austin, especially his seminal *How To Do Things With Words* (1962), provoked an interest in the way language acts to create institutions, social bonds, emotional effects, and modified realities. He described a class of what he called "performative utterances," statements such as "I pronounce you man and wife" or "I sentence you to death" that make things happen in the world. The

American philosopher John Searle, in his books *Speech Acts* (1970) and *The Social Construction of Language* (1995), played an especially important role in furthering Austin's "speech act" theory. Literary critics have used the theory to study how literary language takes the form of lies, promises, excuses, etc.

Austin's work and speech-act theory in general more rightly belong to the field of pragmatics, the study of the active work of language to achieve certain effects in particular situations. Language is both a means of representing things and thoughts and a means of acting in the world. In the contemporary era, the study of the language of literature, which is usually called "stylistics," blends with the study of language in many other arenas of use. Modern rhetoricians examine, for example, the use of language in the discourse of medicine or of economics. They are concerned particularly with the way language contains embedded within it schemas for understanding the world in a particular way. An important assumption of such discourse analysis is that language shapes people's perceptions of the world. Further developments in speech-act theory contend that language also actively constructs social reality. Institutions such as money depend on language acts that create them and guarantee their credibility.

Like such social institutions, literature depends on being read in a certain way in order to be effective and successful. It is written for an audience, and that audience is implied in the text. Reception, response, and interpretation are in a sense preordained by the rhetoric of the literary work, but the audience also plays a role in shaping how the work will be understood and what meanings it will have. Each new generation and each new group of readers in a new setting brings to a work different codes for understanding it.

One of the first literary critics, the Greek philosopher Aristotle, noticed that a work of literature is as remarkable for its effects as for its causes. Tragedy, he famously remarked, succeeds not so much for reasons of formal perfection as for reasons of the emotional transformation that it works on audiences. The turn in the tragic plot is also a turn of emotion in the audience as, with the tragic hero, the audience moves from blindness to recognition. Such recognition is both a moment of cognitive turning or revelation and a moment of affective response and fellow-feeling. Identified with the hero, we also identify with his feelings of horror or pain or despair. His sense of revolt at the mockery Fate works on human delusions is our own.

A sense of the importance of the contact between literary work and its audiences was shunted aside by later aesthetic theories, especially those developed under the auspices of Romanticism. They emphasized the genius of the writer or creator in bringing the ideal and the real, the universal and the concrete, together in a work of art. Attention shifted from the psychological and emotional link between work and audience to the inner harmony or organic unity of the work itself. These aesthetic theories were Platonic rather than Aristotelian, more indebted to the idealism of Plato than to the realism of Aristotle. If a work of literature had an effect on its audience worth noting, it was to inspire awe at the way it provided a sublime glimpse into Eternity.

Two schools of thought worked to resuscitate interest in the role of the audience in literature. One was the historical school that in the eighteenth century argued that to know the meaning of older texts, one had to reconstruct the context in which they were originally written. Who a work was addressed to in part determined how it

should retroactively be interpreted. The other school was the philosophy of Immanuel Kant, who argued that knowledge is shaped by inner mental categories that operate prior to any sense experience. They determine how we know the world. Knowledge that was made up of sensory experience alone would have no unity or coherence. Such ideational unity could be provided only by logical operations that the mind could produce. One implication of this argument was to shift attention toward the work of the observer in constructing knowledge both of the world and of art.

The important point for literary criticism is that the mind comes to literature or to reading already prepared to follow the logic of the narrative or the verse form, to formulate judgments, and to ascribe or deduce meaning. While there may be an object called *King Lear* that exists independently in the world, its very construction as an orderly narrative assumes certain capacities on the part of its audience. They must be capable of recognizing the temporal structure of the play as a unity. As a play in which certain kinds of speech are practiced, certain conclusions are reached, and certain kinds of character delineated, it presupposes that the audience is capable of perceiving this display of literary signs as a coherent order. Each person's reading will be shaped by mental operations that are idiosyncratic and determined by that person's life history and sociocultural context, but some are universal in character (and thus pretty much the same for everyone). The universal mental operations have to do with the ability to follow the logic of temporal narrative and to recognize the different placements of characters in space from scene to scene. The more socially and historically specific (and therefore variable) *a priori* judgments vary according to gender (some women might read the play differently from some men and find Goneril more attractive, for example, than Cordelia) or geography (someone in a country suffering from tyrannical rulers might find the demise of Lear a pleasing, rather than a tragic, resolution).

The Kantian investigation of the role of the mind in shaping knowledge of the world and, by implication, shaping the perception of the work of art was continued by Edmund Husserl at the beginning of the twentieth century. His work on the phenomenology of knowledge deepened an understanding of the operations of consciousness in bringing to sensory experience an ideational and presensory component that was a feature of the mind itself. Husserl was interested in delimiting the pure ideas that were possible only in consciousness. Other philosophers in the same tradition, especially Martin Heidegger and Hans-Georg Gadamer, worked out a compromise between the historicist position and the Kantian one. Knowledge, they argued, occurs in time and history; it cannot achieve the kind of transcendence Husserl especially desired for it. Instead, all knowledge is interpretation, a transfer of meaning from one moment of history into another that always inflects what is known with the categories and assumptions of the later moment. Gadamer, in *Truth and Method* (1972), went so far as to argue that as a result all knowledge will be tinged with error.

The leap from these conclusions to an understanding of the role of the reader's cognition in the work of art was executed by Georges Poulet and Roman Ingarden. The phenomenological literary criticism of Poulet, especially his book *Metamorphoses of the Circle* (1961), transferred to American criticism a sense of the importance of the reader's experience of a literary work. Ingarden's *Cognition of the Work of Art* (1968) argued for an essential link between the work of the audience and the work itself.

The US critic most responsible for disseminating the idea that the reader's experience is as important as those qualities inherent to the work itself was Stanley Fish. Fish argued, famously, that "there is no text in this class," by which he meant that the reader's experience takes precedence over a description of the formal features of the work and, in fact, constitutes those formal features. (See *Is there a Text in this Class?* [1980].) Those features cannot be described except insofar as the mind grasps them. Hence, they have no independent existence apart from the reader's response to them.

More recent thinkers along these lines have explored such things as the psychological workings of reader response to a work of literature. Such work takes two forms. One is an analysis of the way a work manipulates such feeling states as desire, anxiety, and fear. A work of art evokes and directs libidinal urges in its audience. Another strand of work studies actual audiences and asks how they respond to a particular writer. Finally, researchers have also taken to noticing how a single work can be remade by different moments of history or interpreted differently by differently located social agents. *King Lear*, for example, was produced for many years with a happy ending that the culture of the nineteenth century found more appealing than its original tragic conclusion. John Frow has noted that Homer's *Iliad* changes remarkably from one epoch to another, as translators give shape to the original that is usually inflected with their own culture's concerns and preoccupations. French sociologist Pierre Bourdieu argues in his book, *Distinction* (1979), that audiences have different tastes that are largely determined by class location and educational level. We classify literary works according to schemes that we have inherited from our culture and from our social class situation.

Transcendental Aesthetic

Immanuel Kant

First published in 1781, Kant's *Critique of Pure Reason* argued that the mind is an active constructor of our knowledge of the world. While earlier philosophers had noted that experience (the empirical sensation of objects by the mind) played a role in building mental concepts, according to Kant they failed to account for the mind's own *a priori* operations. Such operations occur before experience and make it possible.

General Observations on Transcendental Aesthetic

I. To avoid all misapprehension, it is necessary to explain, as clearly as possible, what our view is regarding the fundamental constitution of sensible knowledge in general.

What we have meant to say is that all our intuition is nothing but the representation of appearance; that the things which we intuit are not in themselves what we intuit them as being, nor their relations so constituted in themselves as they appear to us, and that if the subject, or even only the subjective constitution of the senses in general, be removed, the whole constitution and all the relations of objects in space and time, nay space and time themselves, would vanish. As appearances, they cannot exist in themselves, but only in us. What objects may be in themselves, and apart from all this receptivity of our sensibility, remains completely unknown to us. We know nothing but our mode of perceiving them - a mode which is peculiar to us, and not necessarily shared in by every being, though, certainly, by every human being. With this alone have we any concern. Space and time are its pure forms, and sensation in general its matter. The former alone can we know *a priori*, that is, prior to all actual perception; and such knowledge is therefore called pure intuition. The latter is that in our knowledge which leads to its being called *a posteriori* knowledge, that is, empirical intuition. The former inheres in our sensibility with absolute necessity, no matter of what kind our sensations may be; the latter can exist in varying modes. Even if we could bring our intuition to the highest degree of clearness, we should not thereby come any nearer to the constitution of objects in themselves. We should still know only our mode of intuition, that is, our sensibility. We should, indeed, know it completely, but always only under the conditions of space and time - conditions which are originally inherent in the subject. What the objects may be in themselves would never become known to us even through the most enlightened knowledge of that which is alone given us, namely, their appearance.

The concept of sensibility and of appearance would be falsified, and our whole teaching in regard to them would be rendered empty and useless, if we were to accept

the view that our entire sensibility is nothing but a confused representation of things, containing only what belongs to them in themselves, but doing so under an aggregation of characters and partial representations that we do not consciously distinguish. For the difference between a confused and a clear representation is merely logical, and does not concern the content. No doubt the concept of 'right', in its common-sense usage, contains all that the subtlest speculation can develop out of it, though in its ordinary and practical use we are not conscious of the manifold representations comprised in this thought. But we cannot say that the common concept is therefore sensible, containing a mere appearance. For 'right' can never be an appearance; it is a concept in the understanding, and represents a property (the moral property) of actions, which belongs to them in themselves. The representation of a body in intuition, on the other hand, contains nothing that can belong to an object in itself, but merely the appearance of something, and the mode in which we are affected by that something; and this receptivity of our faculty of knowledge is termed sensibility. Even if that appearance could become completely transparent to us, such knowledge would remain *toto coelo* different from knowledge of the object in itself.

The philosophy of Leibniz and Wolff, in thus treating the difference between the sensible and the intelligible as merely logical, has given a completely wrong direction to all investigations into the nature and origin of our knowledge. This difference is quite evidently transcendental. It does not merely concern their [logical] form, as being either clear or confused. It concerns their origin and content. It is not that by our sensibility we cannot know the nature of things in themselves in any save a confused fashion; we do not apprehend them in any fashion whatsoever. If our subjective constitution be removed, the represented object, with the qualities which sensible intuition bestows upon it, is nowhere to be found, and cannot possibly be found. For it is this subjective constitution which determines its form as appearance.

We commonly distinguish in appearances that which is essentially inherent in their intuition and holds for sense in all human beings, from that which belongs to their intuition accidentally only, and is valid not in relation to sensibility in general but only in relation to a particular standpoint or to a peculiarity of structure in this or that sense. The former kind of knowledge is then declared to represent the object in itself, the latter its appearance only. But this distinction is merely empirical. If, as generally happens, we stop short at this point, and do not proceed, as we ought, to treat the empirical intuition as itself mere appearance, in which nothing that belongs to a thing in itself can be found, our transcendental distinction is lost. We then believe that we know things in themselves, and this in spite of the fact that in the world of sense, however deeply we enquire into its objects, we have to do with nothing but appearances. The rainbow in a sunny shower may be called a mere appearance, and the rain the thing in itself. This is correct, if the latter concept be taken in a merely physical sense. Rain will then be viewed only as that which, in all experience and in all its various positions relative to the senses, is determined thus, and not otherwise, in our intuition. But if we take this empirical object in its general character, and ask, without considering whether or not it is the same for all human sense, whether it represents an object in itself (and by that we cannot mean the drops of rain, for these are already, as appearances, empirical objects), the question as to the relation of the representation to the object at once becomes transcendental. We then realise that not only are the drops of rain mere appearances, but that even their round shape, nay even the space in which they fall, are nothing in themselves, but

merely modifications or fundamental forms of our sensible intuition, and that the transcendental object remains unknown to us.

The second important concern of our Transcendental Aesthetic is that it should not obtain favour merely as a plausible hypothesis, but should have that certainty and freedom from doubt which is required of any theory that is to serve as an organon. To make this certainty completely convincing, we shall select a case by which the validity of the position adopted will be rendered obvious ...

Let us suppose that space and time are in themselves objective, and are conditions of the possibility of things in themselves. In the first place, it is evident that in regard to both there is a large number of *a priori* apodeictic and synthetic propositions. This is especially true of space, to which our chief attention will therefore be directed in this enquiry. Since the propositions of geometry are synthetic *a priori*, and are known with apodeictic certainty, I raise the question, whence do you obtain such propositions, and upon what does the understanding rely in its endeavour to achieve such absolutely necessary and universally valid truths? There is no other way than through concepts or through intuitions; and these are given either *a priori* or *a posteriori*. In their latter form, namely, as *empirical* concepts, and also as that upon which these are grounded, the *empirical* intuition, neither the concepts nor the intuitions can yield any synthetic proposition except such as is itself also merely empirical (that is, a proposition of experience), and which for that very reason can never possess the necessity and absolute universality which are characteristic of all geometrical propositions. As regards the first and sole means of arriving at such knowledge, namely, in *a priori* fashion through mere concepts or through intuitions, it is evident that from mere concepts only analytic knowledge, not synthetic knowledge, is to be obtained. Take, for instance, the proposition, "Two straight lines cannot enclose a space, and with them alone no figure is possible," and try to derive it from the concept of straight lines and of the number two. Or take the proposition, "Given three straight lines, a figure is possible," and try, in like manner, to derive it from the concepts involved. All your labour is vain; and you find that you are constrained to have recourse to intuition, as is always done in geometry. You therefore give yourself an object in intuition. But of what kind is this intuition? Is it a pure *a priori* intuition or an empirical intuition? Were it the latter, no universally valid proposition could ever arise out of it - still less an apodeictic proposition - for experience can never yield such. You must therefore give yourself an object *a priori* in intuition, and ground upon this your synthetic proposition. If there did not exist in you a power of *a priori* intuition; and if that subjective condition were not also at the same time, as regards its form, the universal *a priori* condition under which alone the object of this outer intuition is itself possible; if the object (the triangle) were something in itself, apart from any relation to you, the subject, how could you say that what necessarily exist in you as subjective conditions for the construction of a triangle, must of necessity belong to the triangle itself? You could not then add anything new (the figure) to your concepts (of three lines) as something which must necessarily be met with in the object, since this object is [on that view] given antecedently to your knowledge, and not by means of it. If, therefore, space (and the same is true of time) were not merely a form of your intuition, containing conditions *a priori*, under which alone things can be outer objects to you, and without which subjective conditions outer objects are in themselves nothing, you could not in regard to outer objects determine anything whatsoever in an *a priori* and synthetic manner. It is, therefore, not merely possible or probable, but indubitably certain, that space and time, as the necessary

conditions of all outer and inner experience, are merely subjective conditions of all our intuition, and that in relation to these conditions all objects are therefore mere appearances, and not given us as things in themselves which exist in this manner. For this reason also, while much can be said *a priori* as regards the form of appearances, nothing whatsoever can be asserted of the thing in itself, which may underlie these appearances.

II. In confirmation of this theory of the ideality of both outer and inner sense, and therefore of all objects of the senses, as mere appearances, it is especially relevant to observe that everything in our knowledge which belongs to intuition - feeling of pleasure and pain, and the will, not being knowledge, are excluded - contains nothing but mere relations; namely, of locations in an intuition (extension), of change of location (motion), and of laws according to which this change is determined (moving forces). What it is that is present in this or that location, or what it is that is operative in the things themselves apart from change of location, is not given through intuition. Now a thing in itself cannot be known through mere relations; and we may therefore conclude that since outer sense gives us nothing but mere relations, this sense can contain in its representation only the relation of an object to the subject, and not the inner properties of the object in itself. This also holds true of inner sense, not only because the representations of the *outer senses* constitute the proper material with which we occupy our mind, but because the time in which we set these representations, which is itself antecedent to the consciousness of them in experience, and which underlies them as the formal condition of the mode in which we posit them in the mind, itself contains [only] relations of succession, coexistence, and of that which is coexistent with succession, the enduring. Now that which, as representation, can be antecedent to any and every act of thinking anything, is intuition; and if it contains nothing but relations, it is the form of intuition. Since this form does not represent anything save in so far as something is posited in the mind, it can be nothing but the mode in which the mind is affected through its own activity (namely, through this positing of its representation), and so is affected by itself; in other words, it is nothing but an inner sense in respect of the form of that sense. Everything that is represented through a sense is so far always appearance, and consequently we must either refuse to admit that there is an inner sense, or we must recognise that the subject, which is the object of the sense, can be represented through it only as appearance, not as that subject would judge of itself if its intuition were self-activity only, that is, were intellectual. The whole difficulty is as to how a subject can inwardly intuit itself; and this is a difficulty common to every theory. The consciousness of self (apperception) is the simple representation of the T, and if all that is manifold in the subject were given by the *activity of the self* the inner intuition would be intellectual. In man this consciousness demands inner perception of the manifold which is antecedently given in the subject, and the mode in which this manifold is given in the mind must, as non-spontaneous, be entitled sensibility. If the faculty of coming to consciousness of oneself is to seek out (to apprehend) that which lies in the mind, it must affect the mind, and only in this way can it give rise to an intuition of itself. But the form of this intuition, which exists antecedently in the mind, determines, in the representation of time, the mode in which the manifold is together in the mind, since it then intuits itself not as it would represent itself if immediately self-active, but as it is affected by itself, and therefore as it appears to itself, not as it is.

III. When I say that the intuition of outer objects and the self-intuition of the mind alike represent the objects and the mind, in space and in time, as they affect our senses, that is, as they appear, I do not mean to say that these objects are a mere *illusion*. For in an appearance the objects, nay even the properties that we ascribe to them, are always regarded as something actually given. Since, however, in the relation of the given object to the subject, such properties depend upon the mode of intuition of the subject, this object as *appearance* is to be distinguished from itself as object *in itself*. Thus when I maintain that the quality of space and of time, in conformity with which, as a condition of their existence, I posit both bodies and my own soul, lies in my mode of intuition and not in those objects in themselves, I am not saying that bodies merely *seem* to be outside me, or that my soul only *seems* to be given in my self-consciousness. It would be my own fault, if out of that which I ought to reckon as appearance, I made mere illusion. That does not follow as a consequence of our principle of the ideality of all our sensible intuitions - quite the contrary. It is only if we ascribe *objective reality* to these forms of representation, that it becomes impossible for us to prevent everything being thereby transformed into mere *illusion*. For if we regard space and time as properties which, if they are to be possible at all, must be found in things in themselves, and if we reflect on the absurdities in which we are then involved, in that two infinite things, which are not substances, nor anything actually inhering in substances, must yet have existence, nay, must be the necessary condition of the existence of all things, and moreover must continue to exist, even although all existing things be removed, - we cannot blame the good Berkeley for degrading bodies to mere illusion. Nay, even our own existence, in being made thus dependent upon the self-subsistent reality of a nonentity, such as time, would necessarily be changed with it into sheer illusion - an absurdity of which no one has yet been guilty.

IV. In natural theology, in thinking an object [God], who not only can never be an object of intuition to us but cannot be an object of sensible intuition even to himself, we are careful to remove the conditions of time and space from his intuition - for all his knowledge must be intuition, and not *thought*, which always involves limitations. But with what right can we do this if we have previously made time and space forms of things in themselves, and such as would remain, as *a priori* conditions of the existence of things, even though the things themselves were removed? As conditions of all existence in general, they must also be conditions of the existence of God. If we do not thus treat them as objective forms of all things, the only alternative is to view them as subjective forms of our inner and outer intuition, which is termed sensible, for the very reason that it is *not original*, that is, is not such as can itself give us the existence of its object - a mode of intuition which, so far as we can judge, can belong only to the primordial being. Our mode of intuition is dependent upon the existence of the object, and is therefore possible only if the subject's faculty of representation is affected by that object.

This mode of intuiting in space and time need not be limited to human sensibility. It may be that all finite, thinking beings necessarily agree with man in this respect, although we are not in a position to judge whether this is actually so. But however universal this mode of sensibility may be, it does not therefore cease to be sensibility. It is derivative (*intuitus derivativus*), not original (*intuitus originarius*), and therefore not an intellectual intuition. For the reason stated above, such intellectual intuition seems to belong solely to the primordial being, and can never be ascribed to a

dependent being, dependent in its existence as well as in its intuition, and which through that intuition determines its existence solely in relation to given objects.² This latter remark, however, must be taken only as an illustration of our aesthetic theory, not as forming part of the proof.

Conclusion of the Transcendental Aesthetic

Here, then, in pure *a priori* intuitions, space and time, we have one of the factors required for solution of the general problem of transcendental philosophy: *how are synthetic a priori judgments possible?* When in *a priori* judgment we seek to go out beyond the given concept, we come in the *a priori* intuitions upon that which cannot be discovered in the concept but which is certainly found *a priori* in the intuition corresponding to the concept, and can be connected with it synthetically. Such judgments, however, thus based on intuition, can never extend beyond objects of the senses; they are valid only for objects of possible experience.

Notes

- 1 The predicates of the appearance can be ascribed to the object itself, in relation to our sense, for instance, the red colour or the scent to the rose. [But what is illusory can never be ascribed as predicate to an object (for the sufficient reason that we then attribute to the object, taken by itself, what belongs to it only in relation to the senses, or in general to the subject), for instance, the two handles which were formerly ascribed to Saturn.] That which, while inseparable from the representation of the object, is not to be met with in the object in itself, but always in its relation to the subject, is appearance. Accordingly the predicates of space and time are rightly ascribed to the objects of the senses, as such; and in this there is no illusion. On the other hand, if I ascribe redness to the rose *in itself* [handles to Saturn], or extension to all outer objects *in themselves*, without paying regard to the determinate relation of these objects to the subject, and without limiting my judgment to that relation, illusion then first arises. [The passage enclosed in brackets conflicts with the main argument, and is probably a later addition carelessly inserted.]
- 2 [May be more freely translated as: "through that intuition is conscious of its own existence only in relation to given objects".]

Ideas

Edmund Husserl

First published in 1913, Edmund Husserl's *Ideas: General Introduction to Pure Phenomenology* played a crucial role in the development of twentieth-century European philosophy. Husserl's focus on consciousness and its operations lay at the origin of mid-century phenomenological literary criticism, which studied the movement of consciousness in the literary text.

The Thesis of the Natural Standpoint and its Suspension

The world of the natural standpoint: I and my world about me

Our first outlook upon life is that of natural human beings, imaging, judging, feeling, willing, "*from the natural standpoint.*" Let us make clear to ourselves what this means in the form of simple meditations which we can best carry on in the first person.

I am aware of a world, spread out in space endlessly, and in time becoming and become, without end. I am aware of it, that means, first of all, I discover it immediately, intuitively, I experience it. Through sight, touch, hearing, etc., in the different ways of sensory perception, corporeal things somehow spatially distributed are *for me simply there*, in verbal or figurative sense "present," whether or not I pay them special attention by busying myself with them, considering, thinking, feeling, willing. Animal beings also, perhaps men, are immediately there for me; I look up, I see them, I hear them coming towards me, I grasp them by the hand; speaking with them, I understand immediately what they are sensing and thinking, the feelings that stir them, what they wish or will. They too are present as realities in my field of intuition, even when I pay them no attention. But it is not necessary that they and other objects likewise should be present precisely in my *field of perception*. For me real objects are there, definite, more or less familiar, agreeing with what is actually perceived without being themselves perceived or even intuitively present. I can let my attention wander from the writing-table I have just seen and observed, through the unseen portions of the room behind my back to the verandah, into the garden, to the children in the summer-house, and so forth, to all the objects concerning which I precisely "know" that they are there and yonder in my immediate co-perceived surroundings - a knowledge which has nothing of conceptual thinking in it, and first changes into clear intuiting with the bestowing of attention, and even then only partially and for the most part very imperfectly.

But not even with the added reach of this intuitively clear or dark, distinct or indistinct *co-present* margin, which forms a continuous ring around the actual field of

perception, does that world exhaust itself which in every waking moment is in some conscious measure "present" before me. It reaches rather in a fixed order of being the limitless beyond. What is actually perceived, and what is more or less clearly co-present and determinate (to some extent at least), is partly pervaded, partly girt about with a *dimly apprehended depth or fringe of indeterminate reality*. I can pierce it with rays from the illuminating focus of attention with varying success. Determining representations, dim at first, then livelier, fetch me something out, a chain of such recollections takes shape, the circle of determinacy extends ever farther, and eventually so far that the connexion with the actual field of perception as the *immediate* environment is established. But in general the issue is a different one: an empty mist of dim indeterminacy gets studded over with intuitive possibilities or presumptions, and only the "form" of the world as "world" is foretokened. Moreover, the zone of indeterminacy is infinite. The misty horizon that can never be completely outlined remains necessarily there.

As it is with the world in its ordered being as a spatial present - the aspect I have so far been considering - so likewise is it with the world in respect to its *ordered being in the succession of time*. This word now present to me, and in every waking "now" obviously so, has its temporal horizon, infinite in both direction, its known and unknown, its intimately alive and its unalive past and future. Moving freely within the moment of experience which brings what is present into my intuitional grasp, I can follow up these connexions of the reality which immediately surrounds me. I can shift my standpoint in space and time, look this way and that, turn temporally forwards and backwards; I can provide for myself constantly new and more or less clear and meaningful perceptions and representations, and images also more or less clear, in which I make intuitable to myself whatever can possibly exist really or supposedly in the steadfast order of space and time.

In this way, when consciously awake, I find myself at all times, and without my ever being able to change this, set in relation to a world which, through its constant changes, remains one and ever the same. It is continually "present" for me, and I myself am a member of it. Therefore this world is not there for me as a mere *world of facts and affairs*, but, with the same immediacy, as a *world of values*, a *world of goods*, a *practical world*. Without further effort on my part I find the things before me furnished not only with the qualities that befit their positive nature, but with value-characters such as beautiful or ugly, agreeable or disagreeable, pleasant or unpleasant, and so forth. Things in their immediacy stand there as objects to be used, the "table" with its "books," the "glass to drink from," the "vase," the "piano," and so forth. These values and practicalities, they too belong to *the constitution of the "actually present" objects as such*, irrespective of my turning or not turning to consider them or indeed any other objects. The same considerations apply of course just as well to the men and beasts in my surroundings as to "mere things." They are my "friends" or my "foes," my "servants" or "superiors," "strangers" or "relatives," and so forth.

The "Cogito." My natural world-about-me and the ideal worlds-about-me

It is then to this world, *the world in which I find myself and which is also my world-about-me*, that the complex forms of my manifold and shifting *spontaneities* of consciousness stand related: observing in the interests of research the bringing of meaning into conceptual form through description; comparing and distinguishing,

collecting and counting, presupposing and inferring, the theorizing activity of consciousness, in short, in its different forms and stages. Related to it likewise are the diverse acts and states of sentiment and disapproval, joy and sorrow, desire and aversion, hope and fear, decision and action. All these, together with the sheer acts of the Ego, in which I become acquainted with the world as *immediately* given me, through spontaneous tendencies to turn towards it and to grasp it, are included under the one Cartesian expression: *Cogito*. In the natural urge of life I live continually in *this fundamental form of all "wakeful" living*, whether in addition I do or do not assert the *cogito*, and whether I am or am not "reflectively" concerned with the Ego and the *cogitare*. If I am so concerned, a new *cogito* has become livingly active, which for its part is not reflected upon, and so not objective for me.

I am present to myself continually as someone who perceives, represents, thinks, feels, desires, and so forth; and *for the most part* herein I find myself related in present experience to the fact-world which is constantly about me. But I am not always so related, not every *cogito* in which I live has for its *cogitatum* things, men, objects or contents of one kind or another. Perhaps I am busied with pure numbers and the laws they symbolize: nothing of this sort is present in the world about me, this world of "real fact." And yet the world of numbers also is there for me, as the field of objects with which I am arithmetically busied; while I am thus occupied some numbers or constructions of a numerical kind will be at the focus of vision, girt by an arithmetical horizon partly defined, partly not; but obviously this being-there-for-me, like the being there at all, is something very different from this. *The arithmetical world is there for me only when and so long as I occupy the arithmetical standpoint*. But the *natural* world, the world in the ordinary sense of the word, is *constantly there for me*, so long as I live naturally and look in its direction. I am then at the "*natural standpoint*" which is just another way of stating the same thing. And there is no need to modify these conclusions when I proceed to appropriate to myself the arithmetical world, and other similar "worlds," by adopting the corresponding standpoint. The natural world *still remains "present,"* I am at the natural standpoint after as well as before, and in this respect *undisturbed by the adoption of new standpoints*. If my *cogito* is active *only* in the worlds proper to the new standpoints, the natural world remains unconsidered; it is now the background for my consciousness as act, but it is *not the encircling sphere within which an arithmetical world finds its true and proper place*. The two worlds are present together but *disconnected*, apart, that is, from their relation to the Ego, in virtue of which I can freely direct my glance or my acts to the one or to the other.

The "other" Ego-subject and the intersubjective natural world-about-me

Whatever holds good for me personally, also holds good, as I know, for all other men whom I find present in my world-about-me. Experiencing them as men, I understand and take them as Ego-subjects, units like myself, and related to their natural surroundings. But this in such wise that I apprehend the world-about-them and the world-about-me objectively as one and the same world, which differs in each case only through affecting consciousness differently. Each has his place whence he sees the things that are present, and each enjoys accordingly different appearances of the things. For each, again, the fields of perception and memory actually present are different, quite apart from the fact that even that which is here intersubjectively

known in common is known in different ways, is differently apprehended, shows different grades of clearness, and so forth. Despite all this, we come to understandings with our neighbours, and set up in common an objective spatio-temporal fact-world as *the world about us that is there for us all, and to which we ourselves none the less belong.*

The General Thesis of the Natural Standpoint

That which we have submitted towards the characterization of what is given to us from the natural standpoint, and thereby of the natural standpoint itself, was a piece of pure description *prior to all "theory."* In these studies we stand bodily aloof from all theories, and by "theories" we here mean anticipatory ideas of every kind. Only as facts of our environment, not as agencies for uniting facts validly together, do theories concern us at all. But we do not set ourselves the task of continuing the pure description and raising it to a systematically inclusive and exhaustive characterization of the data, in their full length and breadth, discoverable from the natural standpoint (or from any standpoint, we might add, that can be knit up with the same in a common consent). A task such as this can and must - as scientific - be undertaken, and it is one of extraordinary importance, although so far scarcely noticed. Here it is not ours to attempt. For us who are striving towards the entrance-gate of phenomenology all the necessary work in this direction has already been carried out; the few features pertaining to the natural standpoint which we need are of a quite general character, and have already figured in our descriptions, and been sufficiently *and fully clarified.* We even made a special point of securing this full measure of clearness.

We emphasize a most important point once again in the sentences that follow: I find continually present and standing over against me the one spatio-temporal fact-world to which I myself belong, as do all other men found in it and related in the same way to it. This "fact-world," as the world already tells us, I find to *be out there,* and also *take it just as it gives itself to me as something that exists out there.* All doubting and rejecting of the data of the natural world leaves standing the *general thesis of the natural standpoint.* "The" world is as fact-world always there; at the most it is at odd points "other" than I supposed, this or that under such names as "illusion," "hallucination," and the like, must be struck *out of it,* so to speak; but the "it" remains ever, in the sense of the general thesis, a world that has its being out there. To know it more comprehensively, more trustworthily, more perfectly than the naive lore of experience is able to do, and to solve all the problems of scientific knowledge which offer themselves upon its ground, that is the goal of the *sciences of the natural standpoint*—

We limit still further the theme of our inquiry. Its title ran: Consciousness, or more distinctly *Conscious experience (Erlebnis) in general,* to be taken in an extremely wide sense about whose exact definition we are fortunately not concerned. Exact definitions do not lie at the threshold of analysis of the kind we are here making, but are a later result involving great labour. As starting-point we take consciousness in a pregnant sense which suggests itself at once, most simply indicated through the Cartesian *cogito*, "I think." As is known Descartes understood this in a sense so wide as to include every case of "I perceive, I remember, I fancy, I judge, feel, desire, will," and all experiences of the Ego that in any way resemble the foregoing, in all the countless fluctuations of their special patterns. The Ego itself to which they are all related, spontaneous, in receptive or any other "attitude," and indeed the Ego in

any and every sense, we leave at first out of consideration. We shall be concerned with it later, and fundamentally. For the present there is sufficient other material to serve as support for our analysis and grasp of the essential. And we shall find ourselves forthwith referred thereby to enveloping connexions of experience which compel us to widen our conception of a conscious experience beyond this circle of specific *cogitationes*.

We shall consider conscious experiences *in the concrete fullness and entirety* with which they figure in their concrete context - the *stream of experience* - and to which they are closely attached through their own proper essence. It then becomes evident that every experience in the stream which our reflexion can lay hold on has *its own essence open to intuition*, a "content" which can be considered in its *singularity in and for itself*. We shall be concerned to grasp this individual content of the *cogitatio* in its *pure* singularity, and to describe it in its general features, excluding everything which is not to be found in the *cogitatio* as it is in itself. We must likewise describe the *unity of consciousness* which is demanded by *the intrinsic nature of the cogitationes*, and so necessarily demanded that they could not be without this unity.

Classical Rhetoric

Edward P. J. Corbett

The publication of Edward Corbett's book on classical rhetoric in 1965 was indicative of the revival of interest in rhetoric that took place in the latter half of the twentieth century. In his book, Corbett reviews the major components of classical rhetoric, from the "topics" or kinds of discourse to the figures of speech.

Figures of Speech

We come now to a consideration of figures of speech. It is fair enough to regard figures of speech as the "graces of language," as the "dressing of thought," as "embellishments," for indeed they do "decorate" our prose and give it "style," in the couturier's sense. But it would be a mistake to regard embellishment as the chief or sole function of figures. The classical rhetoricians certainly did not look upon them as decorative devices primarily. Metaphor, according to Aristotle, did give "charm and distinction" to our expression; but even more than that, metaphor was another way to *give* "clearness" and "liveliness" to the expression of our thoughts. Figures, in his view, provided one of the best ways to strike that happy balance between "the obvious and the obscure," so that our audience could grasp our ideas promptly and thereby be disposed to accept our arguments.

"What, then, can oratorical imagery effect?" Longinus asked. He was even more explicit than Aristotle in pointing out the rhetorical function of figures: "Well, it is able in many ways to infuse vehemence and passion into spoken words, while more particularly when it is combined with the argumentative passages it not only persuades the hearer but actually makes him its slave." - *On the Sublime*, XV, 9.

It was Quintilian who most explicitly related the figures to the *logos*, *pathos*, and *ethos* of argument. Quintilian looked upon the figures as another means of lending "credibility to our arguments," of "exciting the emotions," and of winning "approval for our characters as pleaders" (*Instit. Orat.*, IX, i). This view of the function of figures of speech is perhaps the most reliable attitude to adopt toward these devices of style. Because figures can render our thoughts vividly concrete, they help us to communicate with our audience clearly and effectively; because they stir emotional responses, they can carry truth, in Wordsworth's phrase, "alive into the heart by passion"; and because they elicit admiration for the eloquence of the speaker or writer, they can exert a powerful ethical appeal.

Sister Miriam Joseph in her book *Shakespeare's Use of the Arts of Language* reclassified the more than two hundred figures distinguished by the Tudor rhetoricians

according to the four categories: grammar, logos, pathos, and ethos. In doing this, she was able to demonstrate, quite convincingly, that the three "schools" of rhetoric during the Renaissance (the Ramists, the traditionalists, and the figurists) saw the figures as being intimately connected with the topics of invention. Metaphor, for instance, involving comparison of like things, is tied up with the topic of similarity; antithesis, involving the juxtaposition of opposites, is tied up with the topic of dissimilarity or of contraries. Then there were figures, like apostrophe, that were calculated to work directly on the emotions, and figures, like *comprobatio*, that were calculated to establish the ethical image of the speaker or writer. In our exposition we shall frequently point out the relationship of the figures either with grammar or with the three modes of persuasive appeal.

The mention of two hundred figures of speech in the previous paragraph may have appalled the student. If pressed, most students could name - even if they could not define or illustrate - a half dozen figures of speech. But where did those *other* figures come from? and what are they? In their passion for anatomizing and categorizing knowledge, the Humanists of the Renaissance delighted in classifying and sub-classifying the figures. Admittedly, they were being overly subtle in distinguishing such a multitude of figures. The most widely used classical handbook in the Renaissance schools, *Rhetorica ad Herennium*, required the students to learn only 65 figures. Susenbrotus, in his popular *Epitome troporum ac schematum* (1540), distinguished 132 figures. But Henry Peacham, in his 1577 edition of *The Garden of Eloquence*, pushed the number up to 184. Pity the poor Tudor schoolboy who was expected to define and illustrate and to use in his own compositions a goodly number of these figures.

We are not going to plague the student with a long catalogue of figures, but we are going to introduce more figures than he has met with in his previous study of style. If nothing else, the student should become aware, through this exposure, that his language has more figurative resources than he was conscious of. And he may discover that he has been using many of the figures of speech all his life. For men did not begin to use figures of speech only after academicians had classified and defined them; rather, the figures were classified and defined after men had been using them for centuries. Like the principles of grammar, poetics, and rhetoric, the doctrine of the figures was arrived at inductively. Rhetoricians merely gave "names" to the verbal practices of their fellow men.

What do we mean by the term "figures of speech"? We mean the same thing that Quintilian meant when he used the *term figura*: "any deviation, either in thought or expression, from the ordinary and simple method of speaking, a change analogous to the different positions our bodies assume when we sit down, lie down, or look back. ...Let the definition of a figure, therefore, be *a form of speech artfully varied from common usage* (Ergo figura sit arte aliqua novata forma dicendi)" - *Instit. Orat.*, IX, i, II.

We will use "figures of speech" as the generic term for any artful deviations from the ordinary mode of speaking or writing. But we will divide the figures of speech into two main groups - the *schemes* and the *tropes*. A scheme (Greek *schema*, form, shape) involves a deviation from the ordinary pattern or arrangement of words. A trope (Greek *tropein*, to turn) involves a deviation from the ordinary and principal signification of a word.

Both types of figures involve a *transference* of some kind: a trope, a transference of meaning; a scheme, a transference of order. When Shakespeare's Mark Antony said,

"Brutus is an honorable man," he was using the trope called irony, because he was "transferring" the ordinary meaning of the word *honorable* to convey a different meaning to his audience. If Mark Antony had said, "Honorable is the man who gives his life for his country," he would have been using a species of the scheme hyperbaton, because he would be "transferring" the usual order of words. In a sense, of course, both schemes and tropes involve a change of "meaning," since both result in effects that are different from the ordinary mode of expression. But for all practical purposes, our distinction is clear enough to enable the student to distinguish between a scheme and a trope.

The terms used to label the various figures appear formidable - strange, polysyllabic words, most of them merely transliterated from the Greek. But technical terms, in any discipline, are always difficult at first sight; they are difficult, however, mainly because they are unfamiliar. Whenever we study a new discipline we have to learn the "names" of things peculiar to that discipline. Inevitably these specialized terms will be puzzling, but they will remain puzzling only until we learn to connect the *sign* with the concept or thing for which it stands. The word *tree* is difficult for the child only until he learns to associate the sound or the graphic mark of this word with the thing that it designates. The term *prosopopeia* will frighten the student at first, but once he gets to the point where he can immediately associate the term with its significance, *prosopopeia* will be no more frightening to the student than the familiar terms *metaphor* and *simile*. We could, as the Renaissance rhetorician George Puttenham tried to do, invent English terms for the various figures, but since they would have to be coined terms, they would not necessarily be any easier to learn than the classical terms. However, wherever a familiar Anglicized term exists for a figure, we will use that term instead of the classical one.

In any case, we must not look upon terminology as an end in itself. Just as we can speak and write our native language without knowing the names of the parts of speech, so we can use and respond to figurative language without knowing the names of the figures. Nomenclature, in any study, is a convenience for purposes of classification and discussion. But an awareness of the various figures of speech can increase our verbal resources, and if we make a conscious effort to learn the figures of speech, it is likely that we will resort to them more often.

The Schemes

Schemes of words

We shall not dwell very long on schemes of words because while they occur frequently in poetry - especially in the poetry of earlier centuries - they rarely occur in prose. The schemes of words (sometimes called *orthographical schemes*, because they involve changes in the spelling or sound of words) are formed (1) by adding or subtracting a letter or a syllable at the beginning, middle, or end of a word, or (2) by exchanging sounds. Terms like the following are of more concern to the grammarian and the prosodist than to the rhetorician:

prosthesis - adding a syllable in front of word - e.g. *beloved* for *loved*

epenthesis — adding a syllable in the middle of word - e.g. *visitating* for *visiting*

proparalepsis - adding a syllable at the end of word - e.g. *climature* for *climate*

aphaeresis - subtracting a syllable from the beginning of word - e.g. 'neath for *beneath*
syncope — subtracting a syllable from the middle of word - e.g. *prosprous* for *prosperous*
apocope - subtracting a syllable from the end of word - e.g. *even* for *evening* *metathesis* —
 transposition of letters in a word - e.g. *elapse* for *clasp* *antisthecon* — change of sound - e.g.
wrang for *wrong*

One can easily see that all of these involve a change in the shape or configuration of words. Poets used to employ such schemes to accommodate the rhyme or the rhythm of a line of verse. And because such changes are associated primarily with poetry, it is customary to regard such altered words as "poetic diction." Perhaps the situation in modern prose where we are most likely to use schemes of words would be the dialogue in a story. If a character in a story habitually clipped syllables from his words or mispronounced certain words, we might try to indicate those speech habits with spelling changes. Readers of *Finnegans Wake* could supply numerous examples of other uses that James Joyce made of orthographical schemes in his remarkably ingenious prose.

Schemes of Construction

1 Schemes of Balance

PARALLELISM - similarity of structure in a pair or series of related words, phrases, or clauses.

Examples: He tried to make the law equitable, precise, and comprehensive.

To contain the enemy forces, to reinforce his own depleted resources, to inspirit the sagging morale of his troops, and to re-assess the general strategy of the campaign - these were his objectives when he took command.

It is rather for us to be here dedicated to the great task remaining before us - that from those honored dead we take increased devotion to that cause for which they gave the last full measure of devotion; that we here highly resolve that these dead shall not have died in vain; that this nation, under God, shall have a new birth of freedom; and that government of the people, by the people, for the people, shall not perish from the earth. - Abraham Lincoln

Parallelism is one of the basic principles of grammar and rhetoric. The principle demands that equivalent things be set forth in co-ordinate grammatical structures. So nouns must be yoked with nouns, prepositional phrases with prepositional phrases, adverb clauses with adverb clauses. When this principle is ignored, not only is the grammar of co-ordination violated, but the rhetoric of coherence is wrenched. Students must be made to realize that violations of parallelism are serious, not only because they impair communication but because they reflect disorderly thinking. Whenever the student sees a co-ordinating conjunction in one of his sentences, he should check to make sure that the elements joined by the conjunction are of the same grammatical kind. Such a check would prevent him from writing sentences like this: "He was jolly, a good talker, and even better as a drinker."

When the parallel elements are similar not only in structure but in length (that is, the same number of words, even the same number of syllables), the scheme is called *isocolon*. For example: His purpose was *to impress the ignorant, to perplex the dubious, and to confound the scrupulous*. The addition of symmetry of length to similarity of structure contributes greatly to the rhythm of sentences. Obviously, the student should not strive for isocolon every time he produces parallel structure. Such regularity of rhythm would approach the recurrent beat of verse.

Since parallelism is a device that we resort to when we are specifying or enumerating pairs or series of like things, it is easy to see the intimate relationship between this device of form and the topic of similarity. See the analysis of the rhetorical effect of parallelism in Clark Kerr's sentence in the previous section.

ANTITHESIS - the juxtaposition of contrasting ideas, often in parallel structure.

Examples: Contempt is the proper punishment of affectation, and detestation the just consequence of hypocrisy.

Many things difficult to design prove easy to perform.

If you are pleased with prognostics of good, you will be terrified likewise with tokens of evil.

If of Dryden's fire the blaze is brighter, of Pope's the heat is more regular and constant.

All of these examples are quoted from Dr. Johnson, in whose prose, antithesis is such a pronounced feature that we have come to associate this structural device with his name. But antithesis was a scheme greatly admired by all the rhetoricians.

It was the unknown author of *Rhetorica ad Alexandrum* who most clearly pointed up the fact that the opposition in an antithesis can reside either in the words or in the ideas or in both:

An antithesis occurs when both the wording and the sense, or one or other of them, are opposed in a contrast. The following would be an antithesis both of wording and sense: "It is not fair that my opponent should become rich by possessing what belongs to me, while I sacrifice my property and become a mere beggar." In the following sentence we have a merely verbal antithesis: "Let the rich and prosperous give to the poor and needy"; and an antithesis of sense only in the following: "I tended him when he was sick, but he has been the cause of very great misfortune to me." Here there is no verbal antithesis, but the two actions are contrasted. The double antithesis (that is, both of sense and of wording) would be the best to use; but the other two kinds are also true antitheses. (From *Rhetorica ad Alexandrum*, Ch. 26, trans. E. S. Forster)

Nicely managed, antithesis can produce the effect of aphoristic neatness and can win for the author a reputation for wit. Antithesis is obviously related to the topic of dissimilarity and the topic of contraries. (See the analysis of antithesis in Clark Kerr's sentence.)

2 Schemes of unusual or inverted word order (hyperbaton)

ANASTROPHE - inversion of the natural or usual word order.

Examples: Backward run the sentences, till reels the mind. (From a parody of the style of *Time Magazine*.)

With folly no man is willing to confess himself very intimately acquainted. - Dr. Johnson

People that he had known all his life he didn't really know. - student theme

Perfectly does anastrophe conform to our definition of a scheme as "an artful deviation from the ordinary pattern or arrangement of words." Because such deviation surprises expectation, anastrophe can be an effective device for gaining attention. But its chief function is to secure emphasis. It is a commonplace that the beginning and end of a clause are the positions of greatest emphasis. Words placed in those positions draw special attention, and when those initial or terminal words are not normally found in those positions, they receive extraordinary emphasis.

PARENTHESIS - insertion of some verbal unit in a position that interrupts the normal syntactical flow of the sentence.

Examples: But wherein any man is bold - I am speaking foolishly - I also am bold ----- Are they ministers of Christ? I - to speak as a fool - am more. - St. Paul, 2 Cor. 11,21 and 23

He tried - who could do more? - to restrain the fury of the mob.

The extraordinary number of bills passed during that session (312 of them) did not speak well of the Congressmen's capacity for deliberation.

The distinguishing mark of parenthesis is that the interpolated member is "cut off from the syntax of the rest of the sentence. A parenthesis abruptly - and usually briefly - sends the thought off on a tangent. Although the parenthetical matter is not necessary for the grammatical completeness of the sentence, it does have a pronounced rhetorical effect. For a brief moment, we hear the author's voice, commenting, editorializing, and, for that reason, the sentence gets an emotional charge that it would otherwise not have. Note, for instance, the difference in effect if the parenthetical element in St. Paul's first sentence is syntactically integrated with the rest of the sentence: "But I am speaking foolishly if I claim that wherein any man is bold, I also am bold."

APPOSITION - placing side by side two co-ordinate elements, the second of which serves as an explanation or modification of the first.

Examples: John Morgan, the president of the Sons of the Republic, could not be reached by phone.

A great many second-rate poets, in fact, are second-rate just for this reason, that they have not the sensitiveness and consciousness to perceive that they feel differently from the preceding generation and therefore must use words differently. - T. S. Eliot

Men of this kind - soldiers of fortune, pool-hall habitués, gigolos, beachcombers - expend their talents on trivialities.

Apposition is such a common method of expansion in modern prose that it hardly seems to conform to our definition of a scheme as "an artful deviation from the

ordinary patterns of speech." But if one reflects upon his own experience, he will have to acknowledge that appositional structures seldom occur in impromptu speech. Apposition may not be the exclusive property of written prose, but it certainly occurs most frequently in written prose - in a situation, in other words, where we have time to make a conscious choice of our arrangement of words. So there is something *artful* about the use of the appositive. And there is something out-of-the-ordinary about the appositive, too. Although the appositive does not disturb the natural flow of the sentence as violently as parenthetical expressions do (mainly because the appositive is grammatically co-ordinate with the unit that it follows), it does interrupt the flow of the sentence, interrupts the flow to supply some gratuitous information or explanation.

3 Schemes of omission

ELLIPSIS - deliberate omission of a word or of words which are readily implied by the context.

Examples: And he to England shall along with you. - *Hamlet*, III, iii, 4

As with religion, so with education. In colonial New England, education was broad-based, but nevertheless elitist; and in its basic assumptions, intellectualist. - David Marquand, *Encounter* (March 1964)

When in doubt, play trumps.

Ellipsis can be an artful and arresting means of securing economy of expression. We must see to it, however, that the understood words are grammatically compatible. If we wrote, "The ringleader was hanged, and his accomplices imprisoned," we would be guilty of a solecism, because the understood *was* is not grammatically compatible with the plural subject (*accomplices*) of the second clause. And we produce a "howler" if we say, "While in the fourth grade, my father took me to the zoo."

ASYNDETON - deliberate omission of conjunctions between a series of related clauses.

Examples: I came, I saw, I conquered.

They may have it in well-doing, they may have it in learning, they may have it even in criticism. - Matthew Arnold

The infantry plodded forward, the tanks rattled into position, the big guns swung their snouts toward the rim of the hills, the planes raked the underbrush with gunfire.

The Tudor rhetoricians had a special name for the omission of conjunctions between single words or phrases. They would have labelled the following as instances of brachylogia:

... and that government of the people, by the people, for the people, shall not perish from the earth. - Abraham Lincoln

... that we shall pay any price, bear any burden, meet any hardship, support any friend, oppose any foe to assure the survival and the success of liberty. -John F. Kennedy

But there seems to be no good reason why we cannot use the single term *asyndeton* for all these instances of omission of conjunctions. The principal effect of asyndeton is to produce a hurried rhythm in the sentence. Aristotle observed that asyndeton was especially appropriate for the conclusion of a discourse, because there, perhaps more than in any other place in the discourse, we may want to produce the emotional reaction that can be stirred by, among other means, rhythm. And Aristotle concluded his *Rhetoric* with an instance of asyndeton that is noticeable even in translation: "I have done. You have heard me. The facts are before you. I ask for your judgment."

The opposite scheme is polysyndeton (deliberate use of many conjunctions). Note how the proliferation of conjunctions in the following quotation slows up the rhythm of the prose and produces an impressively solemn note:

And God said, "Let the earth bring forth living creatures according to their kinds: cattle and creeping things and beasts of the earth according to their kinds." And it was so. And God made the beasts of the earth according to their kinds and the cattle according to their kinds and everything that creeps upon the ground according to its kind. And God saw that it was good. - Genesis, 1:24—25

Ernest Hemingway uses polysyndeton to create another effect. Note how the repeated *and's* in the following passage suggest the flow and continuity of experience:

I said, "Who killed him?" and he said, "I don't know who killed him but he's dead all right," and it was dark and there was water standing in the street and no lights and windows broke and boats all up in the town and trees blown down and everything all blown and I got a skiff and went out and found my boat where I had her inside Mango Key and she was all right only she was full of water. - Hemingway, "After the Storm"

Polysyndeton can also be used to produce special emphasis. Note the difference in effect of these two sentences:

This semester I am taking English, history, biology, mathematics, sociology, and physical education.

This semester I am taking English and history and biology and mathematics and sociology and physical education.

4 *Schemes of repetition*

ALLITERATION - repetition of initial or medial consonants in two or more adjacent words.

Examples: The moan of doves in immemorial elms

And murmuring of innumerable bees, - Tennyson, *The Princess*

After life's fitful fever he sleeps well. - *Macbeth*, III, ii, 22

It is lawful to picket premises for the purpose of peacefully persuading persons to refrain from trespassing.

In Anglo-Saxon poetry, *alliteration* rather than rhyme was the device to bind verses together. Because it contributes to the euphony of verse or prose, alliteration became

a conspicuous feature of Euphuistic prose and Romantic poetry. Because it is such an obvious mannerism, alliteration is rarely used in modern prose. It is sometimes used today, however, for special effects - as a mnemonic device for slogans (Better Business Builds Bigger Bankrolls) and advertising catch-lines (Spark/ing... F/avorfu... Mi//er High Life... The Champagne of *Bottk Beer... Brewed only* in Mi/waukee. Sometimes alliteration is deliberately used for humorous effect: He was a preposterously pompous proponent of precious pedantry.

ASSONANCE - the repetition of similar vowel sounds, preceded and followed by different consonants, in the stressed syllables of adjacent words.

Example: An old, mad, bh'nd, despzsed, and dj/ing king -
Princes, the dregs of their dwll race, who flow
Through pwblc scorn - *mud* from a mwddy spring -
- Shelley, "Sonnet: England in 1819"

Assonance, a device of sound, like alliteration, is used mainly in poetry. A prose writer might deliberately use assonance to produce certain onomatopoeic or humorous effects. The danger for the prose writer, however, lies in the careless repetition of similar vowel-sounds, producing awkward jingles like this: "He tries to revise the evidence supplied by his eyes."

ANAPHORA ■— repetition of the same word or group of words at the beginnings of successive clauses.

Examples: The Lord sitteth above the water floods. The Lord remaineth a King forever. The Lord shall give strength unto his people. The Lord shall give his people the blessing of peace. - Psalm 29

We shall fight on the beaches, we shall fight on the landing-grounds, we shall fight in the fields and in the streets, we shall fight in the hills. - Winston Churchill

This is the essence - this is the heart - this is the day-to-day stuff of our duty in this Assembly as we see it: to build mightier mansions, to keep strengthening the United Nations. - Adlai E. Stevenson

Whenever anaphora occurs, we can be sure that the author has used it deliberately. Since the repetition of the words helps to establish a marked rhythm in the sequence of clauses, this scheme is usually reserved for those passages where the author wants to produce a strong emotional effect. Note how Reinhold Niebuhr combines anaphora with plays on words to produce this neat aphorism: "Man's capacity for justice makes democracy possible; but man's inclination to injustice makes democracy necessary."

EPISTROPHE - repetition of the same word or group of words at the ends of successive clauses.

Examples: Shylock: I'll have my bond! Speak not against my bond! I
have sworn an oath that I will have my bond!
- *Merchant of Venice*, III, iii, 3-4

When I was a child, I spoke like a child, I thought like a child, I reasoned like a child. -St. Paul, 1 Cor. 13, 11

After a war that everyone was proud of, we concluded a peace that nobody was proud of. - Walter Bagehot

He's learning fast. Are you earning fast? - Advertisement for Aetna Life Insurance

Epistrophe not only sets up a pronounced rhythm but secures a special emphasis, both by repeating the word and by putting the word in the final position in the sentence.

EPANALEPSIS - repetition at the end of a clause of the word that occurred at the beginning of the clause.

Example: Blood hath bought blood, and blows have answer'd blows:
Strength match'd with strength, and power confronted power.
- Shakespeare, *King John*, II, i, 329-30

Epanalepsis is rare in prose, probably because when the emotional situation arises that can make such a scheme appropriate, poetry seems to be the only form that can adequately express the emotion. It would seem perfectly natural for a father to express his grief over the death of a beloved son in this fashion: "He was flesh of my flesh, bone of my bone, blood of my blood." But would the father be speaking prose or poetry? Perhaps the only answer we could give is that it is heightened language of some sort, the kind of language which, despite its appearance of contrivance, springs spontaneously from intense emotion. Repetition, we know, is one of the characteristics of highly emotional language. And in this instance what better way for the father to express the intimacy of the relationship with his son than by the repetition of words at the beginning and end of successive groups of words?

Perhaps the best general advice about the use of epanalepsis - in fact of all those schemes that are appropriate only to extraordinary circumstances - would be, "If you find yourself consciously deciding to use epanalepsis, don't use it." When the time is appropriate, the scheme will present itself unbidden.

ANADIPLOSIS - repetition of the last word of one clause at the beginning of the following clause.

Examples: Labor and care are rewarded with success, success produces confidence, confidence relaxes industry, and negligence ruins the reputation which diligence had raised. - Dr. Johnson, *Rambler* No. 21

They point out what is perfectly obvious, yet seldom realized: That if you have a lot of things you cannot move about a lot, that furniture requires dusting, dusters require servants, servants require insurance stamps ____ It [property] produces men of weight. Men of weight cannot, by definition, move like the lightning from the East unto the West. - E. M. Forster, "My Wood," *Abinger Harvest*

CLIMAX - arrangement of words, phrases, or clauses in an order of increasing importance.

Examples: More than that, we rejoice in our sufferings, knowing that suffering produces endurance, endurance produces character, and character produces hope, and hope does not disappoint us, because God's love has been poured into our hearts through the Holy Spirit which has been given to us. - St. Paul, Romans, 5, 3-5

Let a man acknowledge obligations to his family, his country, and his God.

In our institutions of higher learning one finds with the passing years more and more departmentalized pedants hiding in the holes of research, seeking to run away from embarrassing questions, afraid of philosophy and scared to death of religion. - Bernard Iddings Bell, "Perennial Adolescence"

Climax can be considered a scheme of repetition only when, as in the first example quoted above, it is a continued anadiplosis involving three or more members. Otherwise, as in the second and third examples, it is simply a scheme which arranges a series in an order of gradually rising importance. This latter variety of climax can be looked upon as a scheme related to the topic of degree, and it is the kind of climax that the student will most often find in modern prose and that he will probably find occasion to use in his own prose.

ANTIMETABOLE - repetition of words, in successive clauses, in reverse grammatical order.

Examples: One should eat to live, not live to eat. - Moliere, *L'Avare*

You like it, it likes you. - Advertising slogan for Seven-Up

Mankind must put an end to war — or war will put an end to mankind. - John F. Kennedy, United Nations Speech, 1961

Ask not what America can do for you - ask what you can do for your country. - John F. Kennedy, Inaugural Address

All of these examples have the air of the "neatly turned phrase" - the kind of phrasing that figures in most memorable aphorisms. Would the sentence from President Kennedy's Inaugural Address be so often quoted if it had read something like this: "Do not ask what America can do for you. You would do better to ask whether your country stands in need of *your* services"? The "magic" has now gone out of the appeal. It would be a profitable exercise for the student to take several of the schemes presented in this section and convert them into ordinary prose. Such an exercise would undoubtedly reveal what the schemes add to the expression of the thought.

Similar to antimetabole is the scheme called chiasmus ("the criss-cross"). Chiasmus reverses the grammatical structures in successive clauses, but unlike antimetabole, does not repeat the words. Example: "I am indisposed to work, but to beg I am ashamed." Both antimetabole and chiasmus can be used to reinforce antithesis.

POLYPTOTON - repetition of words derived from the same root.

Examples: The Greeks are *strong*, and *skilful* to their *strength*,
Fierce to their *skill*, and to their *fierceness* valiant;
 - Shakespeare, *Troilus and Cressida*, I, i, 7-8

No man *is just* who deals *unjustly* with another man.

He is a man to *know* because he's *known*.

In the midst of all this dark, this void, this emptiness, I, more *ghostly* than a *ghost*, cry,
 "Who? Who?" to no answer. - Loren Eiseley, "The Uncompleted Man," *Harper's* (March
 1964)

Their *blood bleeds* the nation of its sanguine assurance.

Not as a call to *battle*, though *embattled* we are. - John F. Kennedy, Inaugural Address

Polyptoton is very much akin to those plays on words that we will investigate in the next section on tropes.

The Tropes

Metaphor and simile

METAPHOR - an implied comparison between two things of unlike nature that yet have something in common.

SIMILE — an explicit comparison between two things of unlike nature that yet have something in common.

Examples (all from student themes):

He had a posture like a question-mark, (simile)

On the final examination, several students went down in flames, (metaphor)

Like an arrow, the prosecutor went directly to the point, (simile)

The question of federal aid to parochial schools is a bramble patch, (metaphor)

Silence settled down over the audience like a block of granite, (simile)

Birmingham lighted a runaway fuse, and as fast as the headlines could record them,
 demonstrations exploded all over the country, (metaphor)

We shall treat of metaphor and simile together because they are so much alike. The difference between metaphor and simile lies mainly in the manner of expressing the comparison. Whereas metaphor says, "David was a lion in battle," simile says, "David was *like* a lion in battle." Both of these tropes are related to the topic of similarity, for although the comparison is made between two things of unlike nature (*David* and *lion*), there is some respect in which they are similar (e.g., they are courageous, or they fight ferociously, or they are unconquerable in a fight). The

thing with which the first thing is compared is to be understood in some "transferred sense": *David* is not literally a *lion*, but he is a lion in some "other sense."

An extended or continued metaphor is known as an allegory. We see one of these sustained metaphors in *The Battle of the Books*, where Jonathan Swift compares the classical writers, not to the spider, which spins its web out of its own entrails, but to the far-ranging bee:

As for us the ancients, we are content with the bee to pretend to nothing of our own, beyond our wings and our voices, that is to say, our flights and our language. For the rest, whatever we have got has been by infinite labor and search, and ranging through every corner of nature; the difference is that instead of dirt and poison, we have chosen to fill our hives with honey and wax, thus furnishing mankind with the two noblest of things, which are sweetness and light.

Closely allied to this form of extended metaphor is parable, an anecdotal narrative designed to teach a moral lesson. The most famous examples of parable are those found in the New Testament. In the parable of the sower of seeds, for instance, our interest is not so much in the tale of a man who went out to sow some seeds as in what each detail of the anecdote "stands for," in what the details "mean." Whenever the disciples were puzzled about what a particular parable meant, they asked Christ to interpret it for them.

And while we are talking about these analogical tropes, we should warn the student to be on his guard against the "mixed metaphor," which results when he loses sight of the terms of his comparison. When Joseph Addison said, "There is not a single view of human nature which is not sufficient to extinguish the seeds of pride," it is obvious that he is mixing two different metaphors. We could say "to extinguish *the flames* of pride" or "to *water* the seeds of pride," but we cannot mix the notion of extinguishing with that of seeds. The rhetoricians sometimes called such "wrenching of words" *catachresis*.

SYNECDOCHE -a figure of speech in which a part stands for the whole.

Examples:

genus substituted for the species:

vessel for *ship*, *weapon* for *sword*, *creature* for *man*, *arms* for *rifles*, *vehicle* for *bicycle*

species substituted for the genus: *bread fox*

food, *cutthroat fox assassin*

part substituted for the whole:

sail for *ship*, *hands* for *helpers*, *roofs* for *houses*

matter for what is made from it:

silver for *money*, *canvas* for *sail*, *steel* for *sword*

In general, we have an instance of synecdoche when the part or genus or adjunct that is mentioned suggests something else. It is an *oblique* manner of speaking. All of the following illustrate this trope: "Give us this day our daily *bread*." "All *hands* were summoned to the quarter-deck." "Not *marble*, nor the gilded monuments of princes,

shall outlive this powerful *rhyme*."" "They braved the *waves* to protect their fatherland." "Brandish your *steel*, men." "Are there no *roofs* in this town that will harbor an honorable man?" "It is pleasing to contemplate a *manufacture* rising gradually from its first mean state by the successive *labors* of innumerable *minds*."" - Johnson, *Rambler* No. 9. "The door closed upon the extempore surgeon and midwife, and *Roaring Camp* sat down outside, smoked its pipe, and awaited the issue." - Bret Harte, "The Luck of Roaring Camp."

METONYMY - substitution of some attributive or suggestive word for what is actually meant.

Examples: crown for royalty, mitre for bishop, wealth for rich people, brass for military officers, bottle for wine, pen for writers

Metonymy and synecdoche are so close to being the same trope that George Campbell, the eighteenth-century rhetorician, wondered whether we should make any great effort to distinguish them. Those rhetoricians who did make the effort to discriminate these tropes would label the following as examples of metonymy:

He slinks out of the way of the humblest *petticoat*. - G. B. Shaw

As if the *kitchen* and the *nursery* were less important than the *office* in the city. - G. B. Shaw

"Who is this Son of Man?" Jesus said to them, "The *light* is with you for a little longer. Walk while you have the *light* lest the *darkness* overtake you." -John 13, 34—5

He addressed his remarks to the *chair*.

He was addicted to the *bottle*.

Yesterday I sold a *Rembrandt*.

If the nearness of our last necessity brought a nearer conformity into it, there were happiness in *hoary hairs* and no calamity in *half senses*. — Sir Thomas Browne

In Europe, we gave the *cold shoulder* to De Gaulle, and now he gives the *warm hand* to Mao Tse-tung. - Richard Nixon

PUNS - generic name for those figures which make a play on words.

(1) Antanaclasis - repetition of a word in two different senses.

Learn a *craft* so that when you grow older you will not have to earn your living by *craft*.

Never serve the coffee without the *cream* - Harvey's Bristol *Cream* (advertising slogan)

(2) Paronomasia - use of words alike in sound but different in meaning.

It was *afoul* act to steal my *fowl*. RCA - A *sound*

tradition (advertisement for a stereo set).

- (3) Syllepsis - use of a word understood differently in relation to two or more other words, which it modifies or governs.

He *lost* his hat and his temper.

Here thou, great Anna! whom three realms obey
Dost sometimes counsel *take* - and sometimes tea. - Alexander Pope

The figure of zeugma is somewhat like syllepsis, but whereas in syllepsis the single word is grammatically and idiomatically compatible with both of the other words that it governs, in a zeugma the single word does not fit grammatically or idiomatically with one member of the pair. If we say, "Jane *has murdered* her father, and may you too" or "He maintained a *flourishing* business and racehorse," we would be producing an instance of zeugma, because in both sentences the underlined word is either grammatically or idiomatically incongruous with one member (in these examples, the second member) of the pair it governs. Those two lines from Pope's *Rape of the Lock* which are often classified as zeugma - "Or stain her honour, or her new brocade" and "Or lose her heart, or necklace, at a ball" - would, according to our definition, be examples of syllepsis. Syllepsis is the only one of these two figures which can be considered a form of pun. Zeugma, if skillfully managed, could be impressive as a display of wit, but often enough, zeugma is nothing more than a faulty use of the scheme of ellipsis.

ANTHIMERIA - the substitution of one part of speech for another.

Examples: I'll *unhair* thy head. - Shakespeare, *Antony and Cleopatra*, II, v, 64

A mile before his tent fall down, and *knee*

The way into her mercy. - Shakespeare, *Coriolanus*, V, i⁵

The thunder would not *peace* at my bidding. - Shakespeare, *King Lear*, IV, vi, 103

Dozens of other examples of anthimeria could be quoted from Shakespeare's plays. If a word was not available for what he wanted to express, Shakespeare either coined a word or used an old word in a new way. Today's writer must use *anthimeria* seldom and with great discretion unless he is truly a master of the existing English language. On the other hand, an apt creation can be pungent, evocative, witty, or memorable. English today is a rich, flexible language, because words have been borrowed, changed, and created. Think of all the ways in which a word like *smoke* has been used since it first came into the language:

The smoke rose from the chimney.
The chimney smokes.

He smoked the ham.
 He smokes.
 He asked for a smoke.
 He objected to the smoke nuisance.
 He noticed the smoky atmosphere.
 He tried smoking on the sly.
 He smoked out the thief.
 His dreams went up in smoke.
 The Ferrari smoked along the wet track.

Someday someone will say, if it hasn't been said already, "He looked at her smokily."

PERIPHRAISIS (antonomasia) - substitution of a descriptive word or phrase for a proper name or of a proper name for a quality associated with the name.

Examples: The *Splendid Splinter* hit two more *round-trippers* today.

The Negro does not escape *Jim Crow* when he moves into a higher-income bracket.

She may not have been a *Penelope*, but she was not as unfaithful as the gossips made her out to be.

When his swagger is exhausted, he drivels into erotic poetry or sentimental uxorious-ness.
 And the *Tennysonian King Arthur* posing at *Guinevere* becomes *Don Quixote* grovelling before *Dulcinea*. — G. B. Shaw

The frequency with which we meet this trope, even in modern prose, is evidence of the urge in man to express familiar ideas in uncommon ways. Circumlocutions and tags can become tiresome clichés (as they often do on the sports page), but when they display a fresh, decorous inventiveness, they can add grace to our writing. It is the trite or overly ingenious oblique expression that wearies the reader.

PERSONIFICATION (prosopoeia) - investing abstractions or inanimate objects with human qualities or abilities.

Examples: The ground thirsts for rain.

The very stones cry out for revenge.

Can Honor's voice provoke the silent dust,
 Or Flatt'ry sooth the dull cold ear of Death? - Thomas Gray

Personification is such a familiar figure that there is no need to multiply examples of it. This is one of the figures that should be reserved for passages designed to stir the emotions. Another emotional figure, closely allied to personification, is apostrophe (addressing an absent person or a personified abstraction). Here is an example of apostrophe from Sir Walter Raleigh's *History of the World*:

O eloquent, just, and mighty Death! whom none could advise, thou hast persuaded; what none hath dared, thou hast done; and whom all the world has flattered, thou only hast cast out of the world and despised. Thou hast drawn together all the far-stretched greatness, all the pride, cruelty, and ambition of man, and covered it all with these two narrow words, *Hie jacet*.

HYPERBOLE - the use of exaggerated terms for the purpose of emphasis or heightened effect.

Examples: His eloquence would split rocks.

It's really ironical... I have gray hair. I really do. The one side of my head - the right side - is full of millions of gray hairs. — Holden Caulfield in *Catcher in the Rye*

My left leg weighs three tons. It is embalmed in spices like a mummy. I can't move. I haven't moved for five thousand years. I'm of the time of Pharaoh. - Thomas Bailey Aldrich, "Marjorie Daw"

Hyperbole is so steadily droned into our ears that most of us have ceased to think of it as a figure of speech. Advertisers and teenagers can hardly talk without using superlatives. Perhaps we would not be so much amused by the Oriental greeting, "We welcome you, most honorable sir, to our miserable abode," if we stopped to consider how exaggerated many of our forms of greeting, address, and compliment are.

Hyperbole can be a serviceable figure of speech if we learn to use it with restraint and for a calculated effect. Under the stress of emotion, it will slip out naturally and will then seem appropriate. If we can learn to invent fresh hyperboles, we will be able to produce the right note of emphasis (as in the first example above) or humor (as in the quotation from Aldrich).

Being related to the topic of degree, hyperbole is like the figure called *auxesis* (magnifying the importance or gravity of something by referring to it with a disproportionate name). So a lawyer will try to impress a jury by referring to a scratch on the arm as "a wound" or to pilfering from the petty-cash box as "embezzlement." We can accept Mark Antony's reference to the wound that Brutus inflicted on Caesar as "the most unkindest cut of all," but the occasion seemed not to warrant Senator Joseph McCarthy's classic remark, "That's the most unheard of thing I ever heard of."

LITOTES - deliberate use of understatement, not to deceive someone but to enhance the impressiveness of what we say.

Examples: It was a not unhappy crowd that greeted the team at the airport.

Scaliger's influence in France was not inconsiderable during the sixteenth century. -Joel E. Spingarn, *Literary Criticism in the Renaissance*

Last week I saw a woman flayed, and you will hardly believe how much it altered her appearance for the worse. - Jonathan Swift, *A Tale of a Tub*

I am a citizen of no mean city. - St. Paul

Litotes is a form of meiosis (a lessening). The same lawyer whom we saw in the previous section using auxesis might represent another of his clients by referring to a case of vandalism as "boyish highjinks." A rose by any other name will smell as sweet, but a crime, if referred to by a name that is not too patently disproportionate, may lose some of its heinousness.

RHETORICAL QUESTION (erotema) - asking a question, not for the purpose of eliciting an answer but for the purpose of asserting or denying something obliquely.

Examples: What! Gentlemen, was I not to foresee, or foreseeing was I not to endeavor to save you from all these multiplied mischiefs and disgraces?... Was I an Irishman on that day that I boldly withstood our pride? or on the day that I hung down my head and wept in shame and silence over the humiliation of Great Britain? I became unpopular in England for the one, and in Ireland for the other. What then? What obligation lay on me to be popular? - Edmund Burke, *Speech to the Electors of Bristol*

Wasn't the cult of James a revealing symbol and symbol of an age and society which wanted to dwell like him in some false world of false art and false culture? - Maxwell Geismar, *Henry James and His Cult*

The rhetorical question is a common device in impassioned speeches, but it can be used too in written prose. It can be an effective persuasive device, subtly influencing the kind of response one wants to get from an audience. The manner in which the question is phrased can determine either a negative or an affirmative response. If we say, "Was this an act of heroism?" the audience will respond, in the proper context, with a negative answer. By inducing the audience to make the appropriate response, the rhetorical question can often be more effective as a persuasive device than a direct assertion would be.

IRONY - use of a word in such a way as to convey a meaning opposite to the literal meaning of the word.

Examples: For Brutus is an *honourable* man;
So are they all, all *honourable* men. - Shakespeare, *Julius Caesar*, III, ii, 88-9

It is again objected, as a very absurd, ridiculous custom that a set of men should be suffered, much less employed and hired, to bawl one day in seven against the *lawfulness* of those methods most in use toward the pursuit of greatness, riches, and pleasure, which are the constant practice of all men alive on the other six. But this objection is, I think, a little unworthy of *so refined* an age as ours. - Swift, *Argument Against the Abolishing of Christianity*

As a trope which quite definitely conveys a "transferred meaning," irony is related to the topic of contraries or the topic of contradiction. A highly sophisticated device, irony must be used with great caution. If one misjudges the intelligence of his audience, he may find that his audience is taking his words in their ostensible sense rather than in the intended opposite sense.

The Tudor rhetoricians had a special name for the kind of irony in which one proposed to pass over some matter, yet managed subtly to reveal the matter anyway. They called this kind of irony *paralipsis*. A notable example of paralipsis is found in Mark Antony's famous "Friends, Romans, countrymen" speech in *Julius Caesar*:

Let but the commons hear this testament,
Which (pardon me) I do not mean to read,
And they would go and kiss dead Caesar's wounds...
Have patience, gentle friends; I must not read it.
It is not meet you know how Caesar lov'd you ____
'Tis good you know not that you are his heirs.
(III, ii, 136-51)

A look at the entire speech will show how Antony, despite his disclaimers, managed to let the mob know what was in Caesar's last will.

ONOMATOPOEIA - use of words whose sound echoes the sense.

Examples: 'Tis not enough no harshness gives offense, The
sound must seem an echo to the sense: Soft is the strain
when Zephyr gently blows, And the smooth stream in
smoother numbers flows; But when loud surges lash the
sounding shore, The hoarse, rough verse should like the
torrent roar: When Ajax strives some rock's vast weight to
throw, The line too labors, and the words move slow; Not
so, when swift Camilla scours the plain, Flies o'er the
unbending corn, and skims along the main.

- Pope, *Essay on Criticism*, II, 364—73

Over the cobbles he clattered and clashed in the dark innyard. - Alfred Noyes, "The Highwayman"

The spray was hissing hot, and a huge jet of water burst up from its midst.

In the passage quoted above from Pope, some of the onomatopoeic effects are produced by the rhythm of the lines as well as by the sounds of words. Since onomatopoeia seeks to match sound with sense, it is easy to see why this figure was commonly associated with the topic of similarity. Onomatopoeia will be used much less frequently in prose than in poetry, yet it still has its appropriate uses in prose. Wherever sound-effects can be used to set the emotional or ethical tone of a passage, onomatopoeia can make a contribution. In seeking to discredit a person or an act, we could reinforce the effect of pejorative diction with cacophony. In a phrase like "a dastardly episode," we reveal our attitude toward the event not only by the unpleasant connotations of the word *dastardly* but also by the harsh sound of the word.

OXYMORON - the yoking of two terms which are ordinarily contradictory.

Examples: expressions like *sweet pain*, *cheerful pessimist*, *conspicuous by his absence*, *cruel kindness*, *thunderous silence*, *luxurious poverty*, *abject arrogance*, *make haste slowly*.

By thus combining contradictories, the writer produces a startling effect, and he may, if his oxymorons are fresh and apt, win for himself a reputation for wit. There is displayed in this figure, as in most metaphorical language, what Aristotle considered a special mark of genius: the ability to see similarities. Here are some examples of oxymoron:

Thou, silent form, dost tease us out of thought As
doth eternity: Cold Pastoral!

Keats, "Ode on a Grecian Urn"

But that he may not be thought to conceive nothing but things inconceivable, he has at last thought on a way by which human sufferings may produce good effect. - Dr. Johnson, Review of a treatise by Soame Jenyns

Much as he had accomplished, she could not but observe that his most splendid successes were almost invariably failures, if compared with the ideal at which he aimed. - Nathaniel Hawthorne, "The Birthmark"

As an evolutionist, I never cease to be astounded by the past. - Lor en Eiseley, "The Uncompleted Man," *Harper's* (March 1964)

How To Do Things With Words

J. L. Austin

J. L. Austin's *How To Do Things With Words* (1962) is one of those books that at first seem unremarkable but become increasingly more remarkable with time. Austin describes a class of utterances, which he calls "performatives," that effect actions in the world. John Searle popularized and deepened Austin's work in his book *Speech Acts* (1969). Austin's work has been important for Post-Structuralists and for gender theorists.

Lecture I

Preliminary isolation of the performative¹

The type of utterance we are to consider here is not, of course, in general a type of nonsense; though misuse of it can, as we shall see, engender rather special varieties of 'nonsense'. Rather, it is one of our second class - the masqueraders. But it does not by any means necessarily masquerade as a statement of fact, descriptive or constative. Yet it does quite commonly do so, and that, oddly enough, when it assumes its most explicit form. Grammarians have not, I believe, seen through this 'disguise', and philosophers only at best incidentally. It will be convenient, therefore, to study it first in this misleading form, in order to bring out its characteristics by contrasting them with those of the statement of fact which it apes.

We shall take, then, for our first examples some utterances which can fall into no hitherto recognized *grammatical* category save that of 'statement', which are not nonsense, and which contain none of those verbal danger-signals which philosophers have by now detected or think they have detected (curious words like 'good' or 'all', suspect auxiliaries like 'ought' or 'can', and dubious constructions like the hypothetical): all will have, as it happens, humdrum verbs in the first person singular present indicative active. Utterances can be found, satisfying these conditions, yet such that

- A they do not 'describe' or 'report' or constate anything at all, are not 'true or false';
 - and B the uttering of the sentence is, or is a part of, the doing of an action, which again
- would not *normally* be described as saying something.

This is far from being as paradoxical as it may sound or as I have meanly been trying to make it sound: indeed, the examples now to be given will be disappointing.

Examples:

(E. a) 'I do (sc. take this woman to be my lawful wedded wife)' - as uttered in the course of the marriage ceremony. (E. b) 'I name this ship the *Queen Elizabeth*' - as uttered when smashing the bottle against the stem. (E. c) 'I give and bequeath my watch to my brother' - as occurring in a will. (E. d) 'I bet you sixpence it will rain tomorrow.'

In these examples it seems clear that to utter the sentence (in, of course, the appropriate circumstances) is not to *describe* my doing of what I should be said in so uttering to be doing or to state that I am doing it: it is to do it. None of the utterances cited is either true or false: I assert this as obvious and do not argue it. It needs argument no more than that 'damn' is not true or false: it may be that the utterance 'serves to inform you' - but that is quite different. To name the ship *is* to say (in the appropriate circumstances) the words 'I name, &c.'. When I say, before the registrar or altar, &c, 'I do', I am not reporting on a marriage: I am indulging in it.

What are we to call a sentence or an utterance of this type? I propose to call it a *performative sentence* or a performative utterance, or, for short, 'a performative'. The term 'performative' will be used in a variety of cognate ways and constructions, much as the term 'imperative' is.⁷ The name is derived, of course, from 'perform', the usual verb with the noun 'action': it indicates that the issuing of the utterance is the performing of an action - it is not normally thought of as just saying something.

A number of other terms may suggest themselves, each of which would suitably cover this or that wider or narrower class of performatives: for example, many performatives are *contractual* ('I bet') or *declaratory* ('I declare war') utterances. But no term in current use that I know of is nearly wide enough to cover them all. One technical term that comes nearest to what we need is perhaps 'operative', as it is used strictly by lawyers in referring to that part, i.e. those clauses, of an instrument which serves to effect the transaction (conveyance or what not) which is its main object, whereas the rest of the document merely 'recites' the circumstances in which the transaction is to be effected. But 'operative' has other meanings, and indeed is often used nowadays to mean little more than 'important'. I have preferred a new word, to which, though its etymology is not irrelevant, we shall perhaps not be so ready to attach some preconceived meaning.

Can saying make it so? Are

we then to say things like this:

'To marry is to say a few words', or
'Betting is simply saying something'?

Such a doctrine sounds odd or even flippant at first, but with sufficient safeguards it may become not odd at all.

A sound initial objection to them may be this; and it is not without some importance. In very many cases it is possible to perform an act of exactly the same kind *not* by uttering words, whether written or spoken, but in some other way. For example, I may

in some places effect marriage by cohabiting, or I may bet with a totalisator machine by putting a coin in a slot. We should then, perhaps, convert the propositions above, and put it that 'to say a few certain words is to marry' or 'to marry is, in some cases, simply to say a few words' or 'simply to say a certain something is to bet'.

But probably the real reason why such remarks sound dangerous lies in another obvious fact, to which we shall have to revert in detail later, which is this. The uttering of the words is, indeed, usually a, or even *the*, leading incident in the performance of the act (of betting or what not), the performance of which is also the object of the utterance, but it is far from being usually, even if it is ever, the *sole* thing necessary if the act is to be deemed to have been performed. Speaking generally, it is always necessary that the *circumstances* in which the words are uttered should be in some way, or ways, *appropriate*, and it is very commonly necessary that either the speaker himself or other persons should *also* perform certain *other* actions, whether 'physical' or 'mental' actions or even acts of uttering further words. Thus, for naming the ship, it is essential that I should be the person appointed to name her, for (Christian) marrying, it is essential that I should not be already married with a wife living, sane and undivorced, and so on: for a bet to have been made, it is generally necessary for the offer of the bet to have been accepted by a taker (who must have done something, such as to say 'Done'), and it is hardly a gift if I *say* 'I give it you' but never hand it over.

So far, well and good. The action may be performed in ways other than by a performative utterance, and in any case the circumstances, including other actions, must be appropriate. But we may, in objecting, have something totally different, and this time quite mistaken, in mind, especially when we think of some of the more awe-inspiring performatives such as 'I promise to...' Surely the words must be spoken 'seriously' and so as to be taken 'seriously'? This is, though vague, true enough in general - it is an important commonplace in discussing the purport of any utterance whatsoever. I must not be joking, for example, nor writing a poem. But we are apt to have a feeling that their being serious consists in their being uttered as (merely) the outward and visible sign, for convenience or other record or for information, of an inward and spiritual act: from which it is but a short step to go on to believe or to assume without realizing that for many purposes the outward utterance is a description, *true or false*, of the occurrence of the inward performance. The classic expression of this idea is to be found in the *Hippolytus* (1. 612), where Hippolytus says

r] yXu)Gcr oiiiiox, V Se 4>pf]v avuioxbc;

i.e. 'my tongue swore to, but my heart (or mind or other backstage artiste) did not.'⁹ Thus 'I promise to...' obliges me - puts on record my spiritual assumption of a spiritual shackle.

It is gratifying to observe in this very example how excess of profundity, or rather solemnity, at once paves the way for immodality. For one who says 'promising is not merely a matter of uttering words! It is an inward and spiritual act!' is apt to appear as a solid moralist standing out against a generation of superficial theorizers: we see him as he sees himself, surveying the invisible depths of ethical space, with all the distinction of a specialist in the *sui generis*. Yet he provides Hippolytus with a let-out, the bigamist with an excuse for his 'I do' and the welsher with a defence for his

'I bet'. Accuracy and morality alike are on the side of the plain saying that *our word is our bond*.

If we exclude such fictitious inward acts as this, can we suppose that any of the other things which certainly are normally required to accompany an utterance such as 'I promise that...' or 'I do (take this woman...)' are in fact described by it, and consequently do by their presence make it true or by their absence make it false? Well, taking the latter first, we shall next consider what we actually do say about the utterance concerned when one or another of its normal concomitants is *absent*. In no case do we say that the utterance was false but rather that the utterance - or rather the *act*,¹⁰ e.g. the promise - was void, or given in bad faith, or not implemented, or the like. In the particular case of promising, as with many other performatives, it is appropriate that the person uttering the promise should have a certain intention, viz. here to keep his word: and perhaps of all concomitants this looks the most suitable to be that which 'I promise' does describe or record. Do we not actually, when such intention is absent, speak of a 'false' promise? Yet so to speak is *not* to say that the utterance 'I promise that...' is false, in the sense that though he states that he does, he doesn't, or that though he describes he misdescribes - misreports. For he *does* promise: the promise here is not even *void*, though it is given *in bad faith*. His utterance is perhaps misleading, probably deceitful and doubtless wrong, but it is not a lie or a misstatement. At most we might make out a case for saying that it implies or insinuates a falsehood or a misstatement (to the effect that he does intend to do something): but that is a very different matter. Moreover, we do not speak of a false bet or a false christening; and that we *do* speak of a false promise need commit us no more than the fact that we speak of a false move. 'False' is not necessarily used of statements only.

Lecture II

We were to consider, you will remember, some cases and senses (only some, Heaven help us!) in which to *say* something is to *do* something; or in which *by* saying or *in* saying something we are doing something. This topic is one development - there are many others - in the recent movement towards questioning an age-old assumption in philosophy - the assumption that to say something, at least in all cases worth considering, i.e. all cases considered, is always and simply to *state* something. This assumption is no doubt unconscious, no doubt is wrong, but it is wholly natural in philosophy apparently. We must learn to run before we can walk. If we never made mistakes how should we correct them?

I began by drawing your attention, by way of example, to a few simple utterances of the kind known as performatives or performatives. These have on the face of them the look - or at least the grammatical make-up - of 'statements'; but nevertheless they are seen, when more closely inspected, to be, quite plainly, *not* utterances which could be 'true' or 'false'. Yet to be 'true' or 'false' is traditionally the characteristic mark of a statement. One of our examples was, for instance, the utterance 'I do' (take this woman to be my lawful wedded wife), as uttered in the course of a marriage ceremony. Here we should say that in saying these words we are *doing* something - namely, marrying, rather than *reporting* something, namely *that* we are marrying. And the act of marrying, like, say, the act of betting, is at least *preferably*

(though still not *accurately*) to be described as *saying certain words*, rather than as performing a different, inward and spiritual, action of which these words are merely the outward and audible sign. That this is so can perhaps hardly be *proved*, but it is, I should claim, a fact.

It is worthy of note that, as I am told, in the American law of evidence, a report of what someone else said is admitted as evidence if what he said is an utterance of our performative kind: because this is regarded as a report not so much of something he *said*, as which it would be hear-say and not admissible as evidence, but rather as something he *did*, an action of his. This coincides very well with our initial feelings about performatives.

So far then we have merely felt the firm ground of prejudice slide away beneath our feet. But now how, as philosophers, are we to proceed? One thing we might go on to do, of course, is to take it all back: another would be to bog, by logical stages, down. But all this must take time. Let us first at least concentrate attention on the little matter already mentioned in passing - this matter of 'the appropriate circumstances'. To bet is not, as I pointed out in passing, merely to utter the words 'I bet, &c.': someone might do that all right, and yet we might still not agree that he had in fact, or at least entirely, succeeded in betting. To satisfy ourselves of this, we have only, for example, to announce our bet after the race is over. Besides the uttering of the words of the so-called performative, a good many other things have as a general rule to be right and to go right if we are to be said to have happily brought off our action. What these are we may hope to discover by looking at and classifying types of case in which something *goes wrong* and the act - marrying, betting, bequeathing, christening, or what not - is therefore at least to some extent a failure: the utterance is then, we may say, not indeed false but in general *unhappy*. And for this reason we call the doctrine of *the things that can be and go wrong* on the occasion of such utterances, the doctrine of the *Infelicities*.

Suppose we try first to state schematically - and I do not wish to claim any sort of finality for this scheme - some at least of the things which are necessary for the smooth or 'happy' functioning of a performative (or at least of a highly developed explicit performative, such as we have hitherto been alone concerned with), and then give examples of infelicities and their effects. I fear, but at the same time of course hope, that these necessary conditions to be satisfied will strike you as obvious.

- (A. 1) There must exist an accepted conventional procedure having a certain conventional effect, that procedure to include the uttering of certain words by certain persons in certain circumstances, and further,
- (A. 2) the particular persons and circumstances in a given case must be appropriate for the invocation of the particular procedure invoked.
- (B. 1) The procedure must be executed by all participants both correctly and
- (B. 2) completely.
- (i". 1) Where, as often, the procedure is designed for use by persons having certain thoughts or feelings, or for the inauguration of certain consequential conduct on the part of any participant, then a person participating in and so invoking the procedure must in fact have those thoughts or feelings, and the participants must intend so to conduct themselves,¹¹ and further
- (JT. 2) must actually so conduct themselves subsequently.

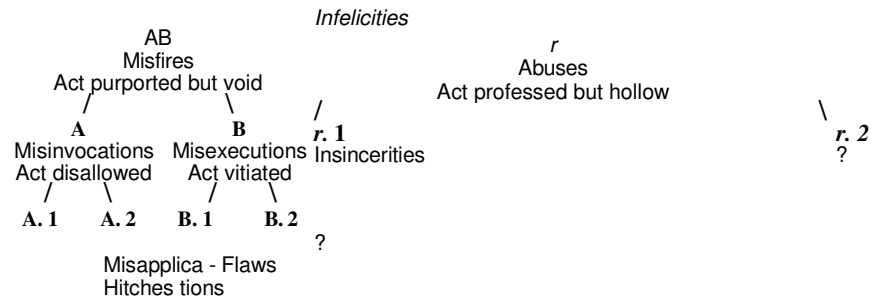

Now if we sin against any one (or more) of these six rules, our performative utterance will be (in one way or another) unhappy. But, of course, there are considerable differences between these 'ways' of being unhappy - ways which are intended to be brought out by the letter-numerals selected for each heading.

The first big distinction is between all the four rules A and B taken together, as opposed to the two rules *T* (hence the use of Roman as opposed to Greek letters). If we offend against any of the former rules (A's or B's) - that is if we, say, utter the formula incorrectly, or if, say, we are not in a position to do the act because we are, say, married already, or it is the purser and not the captain who is conducting the ceremony, then the act in question, e.g. marrying, is not successfully performed at all, does not come off, is not achieved. Whereas in the two *T* cases the act *is* achieved, although to achieve it in such circumstances, as when we are, say, insincere, is an abuse of the procedure. Thus, when I say 'I promise' and have no

intention of keeping it, I have promised but _____. We need names for referring to this general distinction, so we shall call in general those infelicities A. 1-B. 2 which are such that the act for the performing of which, and in the performing of which, the verbal formula in question is designed, is not achieved, by the name MISFIRES; and on the other hand we may christen those infelicities where the act *is* achieved ABUSES (do not stress the normal connotations of these names!). When the utterance is a misfire, the procedure which we purport to invoke is disallowed or is botched: and our act (marrying, &c.) is void or without effect, &c. We speak of our act as a purported act, or perhaps an attempt - or we use such an expression as 'went through a form of marriage' by contrast with 'married'. On the other hand, in the *T* cases, we speak of our infelicitous act as 'professed' or 'hollow' rather than 'purported' or 'empty', and as not implemented, or not consummated, rather than as void or without effect. But let me hasten to add that these distinctions are not hard and fast, and more especially that such words as 'purported' and 'professed' will not bear very much stressing. Two final words about being void or without effect. This does not mean, of course, to say that we won't have done anything: lots of things will have been done - we shall most interestingly have committed the act of bigamy - but we shall *not* have done the purported act, viz. marrying. Because despite the name, you do not when bigamous marry twice. (In short, the algebra of marriage is BOOLEAN.) Further, 'without effect' does not here mean 'without consequences, results, effects'.

Next, we must try to make clear the general distinction between the A cases and the B cases, among the misfires. In both of the cases labelled A there is *misinvocation* of a procedure - either because there *is*, speaking vaguely, no such procedure, or because the procedure in question cannot be made to apply in the way attempted. Hence infelicities of this kind A may be called *Misinvocations*. Among them, we may reasonably christen the second sort - where the procedure does exist all right but can't be applied as purported - *Misapplications*. But I have not succeeded in finding a good name for the other, former, class. By contrast with the A cases, the notion of the B cases is rather that the procedure is all right, and it does apply all right, but we miff the execution of the ritual with more or less dire consequences: so B cases as opposed to A cases will be called *Misexecutions* as opposed to *Misinvocations*: the purported act is *vitiated* by a flaw or hitch in the conduct of the ceremony. The Class B. 1 is that of Flaws, the Class B. 2 that of Hitches.

We get then the following scheme:

I expect some doubts will be entertained about A. 1 and f. 2; but we will postpone them for detailed consideration shortly.

But before going on to details, let me make some general remarks about these infelicities. We may ask:

- (1) To what variety of 'act' does the notion of infelicity apply?
- (2) How complete is this classification of infelicity?
- (3) Are these classes of infelicity mutually exclusive?

Let us take these questions in (that) order.

- (1) How widespread is infelicity?

Well, it seems clear in the first place that, although it has excited us (or failed to excite us) in connexion with certain acts which are or are in part acts of *uttering words*, infelicity is an ill to which *all* acts are heir which have the general character of ritual or ceremonial, all *conventional* acts: not indeed that *every* ritual is liable to every form of infelicity (but then nor is every performative utterance). This is clear if only from the mere fact that many conventional acts, such as betting or conveyance of property, can be performed in non-verbal ways. The same sorts of rule must be observed in all such conventional procedures - we have only to omit the special reference to verbal utterance in our A. This much is obvious.

But, furthermore, it is worth pointing out - reminding you - how many of the 'acts' which concern the jurist are or include the utterance of performatives, or at any rate are or include the performance of some conventional procedures. And of course you will appreciate that in this way and that writers on jurisprudence have constantly shown themselves aware of the varieties of infelicity and even at times of the peculiarities of the performative utterance. Only the still widespread obsession that the utterances of the law, and utterances used in, say, 'acts in the law', *must* somehow be statements true or false, has prevented many lawyers from getting this whole matter much straighter than we are likely to - and I would not even claim to know whether some of them have not already done so. Of more direct concern to us, however, is to realize that, by the same token, a great many of the acts which fall within the province of Ethics are *not*, as philosophers are too prone to assume, simply in the last resort *physical movements*: very many of them have the general character, in whole or part, of conventional or ritual acts, and are therefore, among other things, exposed to infelicity.

Lastly we may ask - and here I must let some of my cats on the table - does the notion of infelicity apply to utterances *which are statements*? So far we have produced the infelicity as characteristic of the *performative* utterance, which was 'defined' (if we

can call it so much) mainly by contrast with the supposedly familiar 'statement'. Yet I will content myself here with pointing out that one of the things that has been happening lately in philosophy is that close attention has been given even to 'statements' which, though not false exactly nor yet 'contradictory', are yet outrageous. For instance, statements which refer to something which does not exist as, for example, 'The present King of France is bald.' There might be a temptation to assimilate this to purporting to bequeath something which you do not own. Is there not a presupposition of existence in each? Is not a statement which refers to something which does not exist not so much false as void? And the more we consider a statement not as a sentence (or proposition) but as an act of speech (out of which the others are logical constructions) the more we are studying the whole thing as an act. Or again, there are obvious similarities between a lie and a false promise. We shall have to return to this matter later.

(2) Our second question was: How complete is this classification?

(i) Well, the first thing to remember is that, since in uttering our performatives we are undoubtedly in a sound enough sense 'performing actions', then, as actions, these will be subject to certain whole dimensions of unsatisfactoriness to which all actions are subject but which are distinct - or distinguishable - from what we have chosen to discuss as infelicities. I mean that actions in general (not all) are liable, for example, to be done under duress, or by accident, or owing to this or that variety of mistake, say, or otherwise unintentionally. In many such cases we are certainly unwilling to say of some such act simply that it was done or that he did it. I am not going into the general doctrine here: in many such cases we may even say the act was 'void' (or voidable for duress or undue influence) and so forth. Now I suppose some very general high-level doctrine might embrace both what we have called infelicities *and* these other 'unhappy' features of the doing of actions - in our case actions containing a performative utterance - in a single doctrine: but we are not including this kind of unhappiness - we must just remember, though, that features of this sort can and do constantly obtrude into any case we are discussing. Features of this sort would normally come under the heading of 'extenuating circumstances' or of 'factors reducing or abrogating the agent's responsibility', and so on.

(ii) Secondly, as *utterances* our performatives are *also* heir to certain other kinds of ill which infect *all* utterances. And these likewise, though again they might be brought into a more general account, we are deliberately at present excluding. I mean, for example, the following: a performative utterance will, for example, be *in a peculiar way* hollow or void if said by an actor on the stage, or if introduced in a poem, or spoken in soliloquy. This applies in a similar manner to any and every utterance - a sea-change in special circumstances. Language in such circumstances is in special ways - intelligibly - used not seriously, but in ways *parasitic* upon its normal use - ways which fall under the doctrine of the *etiolations* of language. All this we are *excluding* from consideration. Our performative utterances, felicitous or not, are to be understood as issued in ordinary circumstances.

(iii) It is partly in order to keep this sort of consideration at least for the present out of it, that I have not here introduced a sort of 'infelicity' - it might

really be called such — arising out of 'misunderstanding'. It is obviously necessary that to have promised I must normally

- (A) have been *heard* by someone, perhaps the promisee;
- (B) have been understood by him as promising.

If one or another of these conditions is not satisfied, doubts arise as to whether I have really promised, and it might be held that my act was only attempted or was void. Special precautions are taken in law to avoid this and other infelicities, e.g. in the serving of writs or summonses. This particular very important consideration we shall have to return to later in another connexion.

- (3) Are these cases of infelicity mutually exclusive? The answer to this is obvious.
 - (a) No, in the sense that we can go wrong in two ways at once (we can insincerely promise a donkey to give it a carrot).
 - (b) No, more importantly, in the sense that the ways of going wrong 'shade into one another' and 'overlap', and the decision between them is 'arbitrary' in various ways.

Suppose, for example, I see a vessel on the stocks, walk up and smash the bottle hung at the stem, proclaim 'I name this ship the *Mr. Stalin*' and for good measure kick away the chocks: but the trouble is, I was not the person chosen to name it (whether or not - an additional complication - *Mr. Stalin* was the destined name; perhaps in a way it is even more of a shame if it was). We can all agree

- (1) that the ship was not thereby named;
- (2) that it is an infernal shame.

One could say that I 'went through a form of naming the vessel but that my 'action' was 'void' or 'without effect', because I was not a proper person, had not the 'capacity', to perform it: but one might also and alternatively say that, where there is not even a pretence of capacity or a colourable claim to it, then there is no accepted conventional procedure; it is a mockery, like a marriage with a monkey. Or again one could say that part of the procedure is getting oneself appointed. When the saint baptized the penguins, was this void because the procedure of baptizing is inappropriate to be applied to penguins, or because there is no accepted procedure of baptizing anything except humans? I do not think that these uncertainties matter in theory, though it is pleasant to investigate them and in practice convenient to be ready, as jurists are, with a terminology to cope with them.

Lecture III

In our first lecture we isolated in a preliminary way the performative utterance as not, or not merely, saying something but doing something, as not a true or false report of something. In the second, we pointed out that though it was not ever true or false it still was subject to criticism - could be unhappy, and we listed six of these types of *Infelicity*. Of these, four were such as to make the utterance Misfire, and the act purported to be done null and void, so that it does not take effect; while two, on the

contrary, only made the professed act an abuse of the procedure. So then we may seem to have armed ourselves with two shiny new concepts with which to crack the crib of Reality, or as it may be, of Confusion - two new keys in our hands, *and* of course, simultaneously two new skids under our feet. In philosophy, forearmed *should* be forewarned. I then stalled around for some time by discussing some general questions about the concept of the Infelicity, and set it in its general place in a new map of the field. I claimed (1) that it applied to *all* ceremonial acts, not merely verbal ones, and that these are more common than is appreciated; I admitted (2) that our list was *not* complete, and that there are indeed other whole dimensions of what might be reasonably called 'unhappiness' affecting ceremonial performances in general and utterances in general, dimensions which are certainly the concern of philosophers; and (3) that, of course, different infelicities can be combined or can overlap and that it can be more or less an optional matter how we classify some given particular example.

We were next to take some examples of infelicities - of the infringement of our six rules. Let me first remind you of rule A. 1, that there must exist an accepted conventional procedure having a certain conventional effect, that procedure to include the uttering of certain words by certain persons in certain circumstances; and rule A. 2 of course, completing it, was that the particular persons and circumstances in a given case must be appropriate for the invocation of the particular procedure invoked.

There must exist an accepted conventional procedure having a certain conventional effect, the procedure to include the uttering of certain words by certain persons in certain circumstances.

A. 1

The latter part, of course, is simply designed to restrict the rule to cases of utterances, and is not important in principle.

Our formulation of this rule contains the two words 'exist' and 'accepted' but we may reasonably ask whether there can be any sense to 'exist' except 'to be accepted', and whether 'be in (general) use' should not be preferred to both. Hence we must not say '(1) exist, (2) be accepted' at any rate. Well, in deference to this reasonable query, let us take just 'accepted' *first*.

If somebody issues a performative utterance, and the utterance is classed as a misfire because the procedure invoked is *not accepted*, it is presumably persons other than the speaker who do not accept it (at least if the speaker is speaking *seriously*). What would be an example? Consider 'I divorce you', said to a wife by her husband in a Christian country, and both being Christians rather than Mohammedans. In this case it might be said, 'nevertheless he has not (successfully) divorced her: we admit only some other verbal or non-verbal procedure'; or even possibly 'we (*we*) do not admit any procedure at all for effecting divorce - marriage is indissoluble.' This may be carried so far that we reject what may be called a *whole code* of procedure, e.g. the code of honour involving duelling: for example, a challenge may be issued by 'my seconds will call on you', which is equivalent to 'I challenge you', and we merely shrug it off. The general position is exploited in the unhappy story of Don Quixote.

Of course, it will be evident that it is comparatively simple if we *never* admit any 'such' procedure at all - that is, any procedure at all for doing that sort of thing, or that procedure *anyway* for doing that particular thing. But equally possible are the

cases where we do sometimes - in certain circumstances or at certain hands - accept a procedure, but *not* in any other circumstances or at other hands. And here we may often be in doubt (as in the naming example above) whether an infelicity should be brought into our present class A. 1 or rather into A. 2 (or even B. 1 or B. 2). For example, at a party, you say, when picking sides, 'I pick George': George grunts 'I'm not playing.' Has George been picked? Undoubtedly, the situation is an unhappy one. Well, we may say, you have not picked George, whether because there is no convention that you can pick people who aren't playing or because George in the circumstances is an inappropriate object for the procedure of picking. Or on a desert island you may say to me 'Go and pick up wood'; and I may say 'I don't take orders from you' or 'you're not entitled to give me orders' - I do not take orders from you when you try to 'assert your authority' (which I might fall in with but may not) on a desert island, as opposed to the case when you are the captain on a ship and therefore genuinely have authority.

Now we could say, bringing the case under A. 2 (Misapplication): the procedure - uttering certain words, &c. - was O.K. and accepted, but the circumstances in which it was invoked or the persons who invoked it were wrong: 'I pick' is only in order when the object of the verb is 'a player', and a command is in order only when the subject of the verb is 'a commander' or 'an authority'.

Or again we could say, bringing the case under rule B. 2 (and perhaps we should reduce the former suggestion to this): the procedure has not been completely executed; because it is a necessary *part* of it that, say, the person to be the object of the verb 'I order to...' must, by some previous procedure, tacit or verbal, have first constituted the person who is to do the ordering an authority, e.g. by saying 'I promise to do what you order me to do.' This is, of course, *one* of the uncertainties - and a purely general one really - which underlie the debate when we discuss in political theory whether there is or is not or should be a social contract.

It appears to me that it does not matter in principle at all how we decide in particular cases - though we may agree, either on the facts or by introducing further definitions, to prefer one solution rather than another - but that it is important in principle to be clear:

(1) as against B. 2 that however much we take into the procedure it would still be possible for someone to reject it *all*;

(2) that for a procedure to be *accepted* involves more than for it merely to be the case that it is *in fact generally used*, even actually by the persons now concerned; and that it must remain in principle open for anyone to reject any procedure - or code of procedures - even one that he has already hitherto accepted — as may happen with, for example, the code of honour. One who does so is, of course, liable to sanctions; others refuse to play with him or say that he is not a man of honour. *Above all* all must not be put into flat factual circumstances; for this is subject to the old objection to deriving an 'ought' from an 'is'. (Being accepted is *not* a circumstance in the right sense.) With many procedures, for example playing games, however appropriate the circumstances may be I may still not be playing, and, further, we should contend that in the last resort it is doubtful if 'being accepted' is definable as being 'usually' employed. But this is a more difficult matter.

Now secondly, what could be meant by the suggestion that sometimes a procedure may not even exist - as distinct from the question whether it is accepted, and by this or that group, or not?

(i) We have the case of procedures which 'no longer exist' merely in the sense that though once generally accepted, they are no longer generally accepted, or even accepted by anybody; for example the case of challenging; and

(ii) we have even the case of procedures which someone is initiating. Sometimes he may 'get away with it' like, in football, the man who first picked up the ball and ran. Getting away with things is essential, despite the suspicious terminology. Consider a possible case: to say 'you were cowardly' may be to reprimand you or to insult you: and I can make my performance explicit by saying 'I reprimand you', but I cannot do so by saying 'I insult you' - the reasons for this do not matter here.¹ All that does matter is that a special variety of non-play can arise if someone *does* say 'I insult you': for while insulting is a conventional procedure, and indeed primarily a verbal one, so that in a way we cannot help understanding the procedure that someone who says 'I insult you' is purporting to invoke, yet we are bound to non-play him, not merely because the convention is not accepted, but because we vaguely feel the presence of some bar, the nature of which is not immediately clear, against its ever being accepted.

Much more common, however, will be cases where it is uncertain how far a procedure extends - which cases it covers or which varieties it could be made to cover. It is inherent in the nature of any procedure that the limits of its applicability, and therewith, of course, the 'precise' definition of the procedure, will remain vague. There will always occur difficult or marginal cases where nothing in the previous history of a conventional procedure will decide conclusively whether such a procedure is or is not correctly applied to such a case. Can I baptize a dog, if it is admittedly rational? Or should I be non-played? The law abounds in such difficult decisions - in which, of course, it becomes more or less arbitrary whether we regard ourselves as deciding (A. 1) that a convention does not exist or as deciding (A. 2) that the circumstances are not appropriate for the invocation of a convention which undoubtedly does exist: either way, we shall tend to be bound by the 'precedent' we set. Lawyers usually prefer the latter course, as being to apply rather than to make law.

There is, however, a further type of case which may arise, which might be classified in many ways, but which deserves a special mention.

The performative utterances I have taken as examples are all of them highly developed affairs, of the kind that we shall later call *explicit* performatives, by contrast with merely *implicit* performatives. That is to say, they (all) begin with or include some highly significant and unambiguous expression such as 'I bet', 'I promise', 'I bequeath' - an expression very commonly also used in naming the act which, in making such an utterance, I am performing - for example betting, promising, bequeathing, &c. But, of course, it is both obvious and important that we can on occasion use the utterance 'go' to achieve practically the same as we achieve by the utterance 'I order you to go': and we should say cheerfully in either case, describing subsequently what someone did, that he ordered me to go. It may, however, be uncertain in fact, and, so far as the mere utterance is concerned, is always left uncertain when we use so inexplicit a formula as the mere imperative 'go', whether the utterer is ordering (or is purporting to order) me to go or merely advising, entreating, or what not me to go. Similarly 'There is a bull in the field' may or may not be a warning, for I *might* just be describing the scenery and 'I shall

be there' may or may not be a promise. Here we have primitive as distinct from explicit performatives; and there may be nothing in the circumstances by which we can decide whether or not the utterance is performative at all. Anyway, in a given situation it can be open to me to take it as *either* one or the other. It was a performative formula - *perhaps* - but the procedure in question was not sufficiently explicitly invoked. Perhaps I did not *take it as* an order or was not anyway *bound* to take it as an order. The person did not *take it as* a promise: i.e. in the particular circumstance he did not accept the procedure, on the ground that the ritual was incompletely carried out by the original speaker.

We could assimilate this to a faulty or incomplete performance (B. 1 or B. 2): except that it is complete really, though not unambiguous. (In the law, of course, this kind of inexplicit performative *will* normally be brought under B. 1 or B. 2 - it is made a rule that to bequeath inexplicitly, for instance, is either an incorrect or an incomplete performance; but in ordinary life there is no such rigidity.) We could also assimilate it to Misunderstandings (which we are not yet considering): but it would be a special kind, concerning the force of the utterance as opposed to its meaning. And the point is not here just that the audience *did not* understand but that it did not *have* to understand, e.g. to *take it as* an order.

We might indeed even assimilate it to A. 2 by saying that the procedure is not designed for use where it is not clear that it is being used - which use makes it altogether void. We might claim that it is only to be used in circumstances which make it unambiguously clear that it is being used. But this is a counsel of perfection.

A. 2. *The particular persons and circumstances in a given case must be appropriate for the invocation of the particular procedure invoked.* We turn next to infringements of A. 2, the type of infelicity which we have called Misapplications. Examples here are legion. 'I appoint you', said when you have already been appointed, or when someone else has been appointed, or when I am not entitled to appoint, or when you are a horse: 'I do', said when you are in the prohibited degrees of relationship, or before a ship's captain not at sea: 'I give', said when it is not mine to give or when it is a pound of my living and non-detached flesh. We have various special terms for use in different types of case - '*ultra vires*' 'incapacity', 'not a fit or proper object (or person, &c.)', 'not entitled', and so on.

The boundary between 'inappropriate persons' and 'inappropriate circumstances' will necessarily not be a very hard and fast one. Indeed 'circumstances' can clearly be extended to cover in general 'the natures' of all persons participating. But we must distinguish between cases where the inappropriateness of persons, objects, names, &c, is a matter of 'incapacity' and simpler cases where the object or 'performer' is of the wrong kind or type. This again is a roughish and vanishing distinction, yet not without importance (in, say, the law). Thus we must distinguish the cases of a clergyman baptizing the wrong baby with the right name or baptizing a baby 'Albert' instead of 'Alfred', from those of saying 'I baptize this infant 2704' or 'I promise I will bash your face in' or appointing a horse as Consul. In the latter cases there is something of the wrong kind or type included, whereas in the others the inappropriateness is only a matter of incapacity.

Some overlaps of A. 2 with A. 1 and B. 1 have already been mentioned: perhaps we are more likely to call it a misinvocation (A. 1) if the person *as such* is inappropriate than if it is just because it is not the duly appointed one - if *nothing* - no

antecedent procedure or appointment, &c. - could have put the matter in order. On the other hand, if we take the question of *appointment* literally (position as opposed to status) we might class the infelicity as a matter of wrongly executed rather than as misapplied procedure - for example, if we vote for a candidate before he has been nominated. The question here is how far we are to go back in the 'procedure'.

Next we have examples of B (already, of course, trenched upon) called Misexecutions.

B. 1. *The procedure must be executed by all participants correctly.* These are flaws. They consist in the use of, for example, wrong formulas - there is a procedure which is appropriate to the persons and the circumstances, but it is not gone through correctly. Examples are more easily seen in the law; they are naturally not so definite in ordinary life, where allowances are made. The use of inexplicit formulas might be put under this heading. Also under this heading falls the use of vague formulas and uncertain references, for example if I say 'my house' when I have two, or if I say 'I bet you the race won't be run today' when more than one race was arranged. This is a different question from that of misunderstanding or slow up-take by the audience; a flaw in the ritual is involved, however the audience took it. One of the things that cause particular difficulty is the question whether when two parties are involved "*consensus ad idem*"¹ is necessary. Is it essential for me to secure *correct understanding* as well as everything else? In any case this is clearly a matter falling under the B rules and not under the T rules.

B. 2. *The procedure must be executed by all participants completely.* These are hitches; we attempt to carry out the procedure but the act is abortive. For example: my attempt to make a bet by saying 'I bet you sixpence' is abortive unless you say 'I take you on' or words to that effect; my attempt to marry by saying 'I will' is abortive if the woman says 'I will not'; my attempt to challenge you is abortive if I say 'I challenge you' but I fail to send round my seconds; my attempt ceremonially to open a library is abortive if I say 'I open this library' but the key snaps in the lock; conversely the christening of a ship is abortive if I kick away the chocks before I have said 'I launch this ship.' Here again, in ordinary life, a certain laxness in procedure is permitted - otherwise no university business would ever get done!

Naturally sometimes uncertainties about whether anything further is required or not will arise. For example, are you required to accept the gift if I am to give you something? Certainly in formal business acceptance is required, but is this ordinarily so? Similar uncertainty arises if an appointment is made without the consent of the person appointed. The question here is how far can acts be unilateral? Similarly the question arises as to when the act is at an end, what counts as its completion?¹⁷

In all this I would remind you that we were *not* invoking such further dimensions of unhappiness as may arise from, say, the performer making a simple mistake of fact or from disagreements over matters of fact, let alone disagreements of opinion; for example, there is no convention that I can promise you to do something to your detriment, thus putting myself under an obligation to you to do it; but suppose I say 'I promise to send you to a nunnery' - when I think, but you do not, that this will be for your good, or again when you think it will but I do not, or even when we both think it will, but in fact, as may transpire, it will not? Have I invoked a non-existent convention in inappropriate circumstances? Needless to say, and as a matter of general

principle, there can be no satisfactory choice between these alternatives, which are too unsubtle to fit subtle cases. There is no short cut to expounding simply the full complexity of the situation which does not exactly fit any common classification.

It may appear in all this that we have merely been taking back our rules. But this is not the case. Clearly there are these six possibilities of infelicity even if it is sometimes uncertain which is involved in a particular case: and we *might* define them, at least for given cases, if we wished. And we must at all costs avoid oversimplification, which one might be tempted to call the occupational disease of philosophers if it were not their occupation.

Notes

- 1 Everything said in these sections is provisional, and subject to revision in the light of later sections.
- 2 Of all people, jurists should be best aware of the true state of affairs. Perhaps some now are. Yet they will succumb to their own timorous fiction, that a statement of 'the law' is a statement of fact.
- 3 Not without design: they are all 'explicit' performatives, and of that prepotent class later called 'exercitives'.
- 4 [Austin realized that the expression 'I do' is not used in the marriage ceremony too late to correct his mistake. We have let it remain in the text as it is philosophically unimportant that it is a mistake. J. O. Urmson.]
- 5 Still less anything that I have already done or have yet to do.
- 6 'Sentences' form a class of 'utterances', which class is to be defined, so far as I am concerned, grammatically, though I doubt if the definition has yet been given satisfactorily. With performative utterances are contrasted, for example and essentially, 'constative' utterances: to issue a constative utterance (i.e. to utter it with a historical reference) is to make a statement. To issue a performative utterance is, for example, to make a bet. See further below on 'illocutions'.
- 7 Formerly I used 'performatory': but 'performative' is to be preferred as shorter, less ugly, more tractable, and more traditional in formation.
- 8 I owe this observation to Professor H. L. A. Hart.
- 9 But I do not mean to rule out all the offstage performers - the lights men, the stage manager, even the prompter; I am objecting only to certain officious understudies.
- 10 We shall avoid distinguishing these precisely because the distinction is not in point.
- 11 It will be explained later why the having of these thoughts, feelings, and intentions is not included as just one among the other 'circumstances' already dealt with in (A).
- 12 [Austin from time to time used other names for the different infelicities. For interest some are here given: A. 1, Non-plays; A. 2, Misplays; B, Miscarriages; B. 1, Misexecutions; B. 2, Non-executions; F, Disrespects; F. 1, Dissimulations; F. 2, Non-fulfilments, Disloyalties, Infractions, Indisciplines, Breaches. J. O. Urmson.]
- 13 Naming babies is even more difficult; we might have the wrong name and the wrong cleric - that is, someone entitled to name babies but not intended to name *this* one.
- 14 If we object here to saying that there is doubt whether it 'exists' - as well we may, for the word gives us currently fashionable creeps which are in general undoubtedly legitimate, we might say that the doubt is rather as to the precise nature or definition or comprehension of the procedure which undoubtedly does exist and *is* accepted.
- 15 Many such possible procedures and formulas would be disadvantageous if recognized; for example, perhaps we ought not to allow the formula 'I promise you that I'll thrash you.' But I am told that in the hey-day of student duelling in Germany it was the custom for members of one club to march past members of a rival club, each drawn up in file, and then for each to say to his chosen opponent as he passed, quite politely, 'Beleidigung', which means 'I insult you.'
- 16 ['Non-play' was at one time Austin's name for the category A. 1 of infelicities. He later rejected it but it remains in his notes at this point. J. O. Urmson.]
- 17 It might thus be doubted whether failure to hand a gift over is a failure to complete the gift or an infelicity of type f.

Tacit Persuasion Patterns

Richard Lanham

In this enlightening chapter from his book, *Analyzing Prose* (1983, 2003), Richard Lanham examines the implied rhetorical patterns of persuasive style. He asks why it is that repetition and linguistic crossing are so conducive to persuasion. And he demonstrates through many examples that writing often assumes shapes that carry with them an implicit tendency to harmonize with our own expectations as readers and therefore to more easily persuade. The glossary of rhetorical terms that follows is also from the same book.

Some social situations seem to carry within themselves a kind of natural persuasiveness, suggest by their very shape a "logical" or "just" outcome. The game theorists who have studied these shapes have christened them "tacit bargaining" patterns, patterns which tacitly suggest a certain outcome. Assume, for example, that you and I are paratroopers dropped behind enemy lines. We become separated during the descent and, since we carelessly failed to plan for such an eventuality, we don't know where to meet. We do, though, have the same map:

I land in the meadow. You - though I don't know it - come down in the forest. Where would you guess I would guess you might guess that we might "logically" meet? Most people say the bridge. Why? It is not in the center of the map. And if it

were, would that make a difference? Obviously it would, because the center provides a natural focus. And so, though off-center, does the bridge. It comes as close to a crossroads, a natural meeting point, as this map affords. If we had both grown up in this area, and spent many a long summer's afternoon at the forest pool, it would be a different story. Or suppose, instead, that a red army entered the mapped area from the wooded side and a white army from the meadow. Each had orders to occupy as much territory as possible without actively engaging the enemy. Chances are they'd both stop at the river. These tacit bargaining situations occur all the time. Their "logic," though, often seems hidden and seldom really logical. If you are the boss and I ask for a raise from \$20 to \$25 per hour you might say you'll "meet me halfway" at \$22.50 per hour. It somehow "seems fair." Actually my going rate may be \$25 and so \$22.50 will not be "logical," that is to say commonly thought fair, at all: If so, I ought to have asked for a raise from \$20 to \$30 per hour so that the tacit bargaining logic would operate with real "logic" - at least from my point of view - to suggest \$25 per hour.

Something analogous to these tacit bargaining patterns occurs in verbal style. Shapes, either sound patterns or sight patterns, often seem to bring with them their own kind of illogical persuasion. We might call them "tacit persuasion" patterns. For the most part, we simply don't know why they affect us as they do. It must come from how the brain processes information but that doesn't really tell us anything. To answer the question properly, we would need to ask how the visual cortex processes visual patterns and then apply that information to chiasmus, say, or isocolon or, why does the axial symmetry of the human body incline us to relish the same kind of symmetry in the outside world? (Think of all those symmetrical patterns we've come across in prose style.) I'm not competent to do this kind of analysis, even if we had time for it here. We don't. We can offer only a general caution: shape makes a lot of difference in prose. A great deal of persuasion occurs in this way and most of it remains tacit, unacknowledged. Some shapes seem to carry their own persuasiveness, irrespective of their content. We feel their presence subconsciously, even if we do not bring that knowledge to self-awareness. A few examples of how such tacit persuading works may alert you to these subcutaneous strategies, even if none of us is quite sure how they work.

We have always - Aristotle started it - restricted the most obvious tacit bargaining shapes to poetry, but the restriction has never worked. Even the most obvious tacit bargaining shape - rhyme - comes into prose all the time. We reach for it every time we want to seem cunning or memorable, as when the first New England Lodge rejoined to a member of the rival family, "It's their habit, Cabot." Here the rhyme (it *is* a rhyme in Lodge-and-Cabot Land) works just for fun, but sound resemblance can yoke meaning, too, as when a politician never hesitates to "fight for the right" but remains "deft with the left." This kind of capitalizing on the chance resemblances of language occurs all the time. Do it too much, of course, and people get annoyed. You've moved over from clever prose stylist to third-rate versifier. And so prose more often uses rhyme's kissing cousins than rhyme itself.

Thus a lapidary phrase-maker might use polyptoton (repetition of a word with the same root but a different ending). Lord Randolph Churchill was fond of saying that "The duty of an Opposition is to oppose," and Disraeli of urging that "Adventures are to the adventurous." This neat trick offers a lot of put-down mileage, especially in the "[Law] is too important to leave to the [lawyers]" form, filling in for "Law" and "lawyer" whatever profession you want to disparage. Or you vary the form by using a synonym instead of the same root word, as when George Bernard Shaw

sighed "How wonderful is youth: why must it be wasted on children?" Such a pattern becomes a kind of mold for thought, or machinery for generating it.

Or we can use a homonymic pun (*paronomasia*), as in "If life is a gamble, make it also a gambol." No *etymological* logic galvanizes this capitalization on linguistic chance. "Gambol" comes from the Italian word *gamba* (leg) and "gamble" from the Anglo-Saxon word for game, *gamen*. But the near-rhyme invites us to a tacit bargain: yes, gamble and gambol ought to be equivalent in something besides sound. Chance should lead to pleasure.

Even the most dedicated opponents of pleasure and language play have been tempted by the near-rhyme polyptotonic habit. The very hammer of the rhetors, Socrates, says (albeit ironically) when he is accused of dressing up to go to Agathon's house: $\chi^{\alpha\alpha}\sigma\iota\tau\eta\alpha\ \chi\&h\iota>$ - "One must be beautiful when going to visit the beautiful." Proverbs, in the European languages at least, use polyptotonic techniques all the time. "*Homo proponit sed Deus disponit* - Man proposes but God disposes." Why does it work so well? What itch does it scratch? If I say of a now-faded classical beauty, "She is but a shadow of her faded middle-aged self," ho-hum. But, "She has faded long since to the shadow of a shade," seems to echo time itself. Why do we want to become Rabelaisian word-spinners, take a word and conjugate or decline its essence out? The tacit power here seems to flow from conjugatability itself, from the transforming power exercised when we use one part of speech for another (the rhetorical term for this is *anthimeria*) or change form or case. The root word exudes a power the whole range of tacit persuasion patterns can draw upon.

Polyptoton is often reinforced by another tacit persuasion pattern - alliteration. Churchill writes "We shall not flag or fail." An Elizabethan storyteller calls Helen of Troy "a piece of price." The liberated puritan calls a misfortune "sad as Sunday." Cliches pickle themselves in a similar alliterative form: "cool, calm, and collected," "fast and furious," "flight of fancy," "forbidden fruit," "top to toe," "enough to make your blood boil." Why do we find this alliterative, "following the letter" form of tacit persuasion so attractive? No one knows for sure. Clearly the pleasure is childlike and, as Freud argued, harks back to babbling, to the fun we had with sounds before they were disciplined by meaning. But this doesn't go far in explaining how alliteration works in mature prose. Alliteration, after all only a kind of front rhyme, poses the same fundamental question. Why do we like it?

The simpler question - how does it work? - involves tacit persuasion at its most obvious. In the map illustration we began with, there just happened to be a bridge across the river. We met there by capitalizing on that chance. Alliteration, or front rhyme, has been traditionally more acceptable in prose than end-rhyme but both do the same thing - capitalize on chance. These patterns can do it just for fun, as in the cliches I've just listed. Or they can underscore other tacit persuasion patterns - chiasmus, isocolon, or climax, for example. This powerful glue can connect elements without logical relationship. Because alliteration does work so well, because we acknowledge the "rightness" of "fate's fickle finger" with a part of our mind not under logical control, people have always resented alliteration and tried to outlaw it. It has no right to work as well as it does.

Language is full of these chance resemblances of sound and spelling and prose stylists have always capitalized on them, used them to suggest a natural affinity between objects or concepts which logically possessed none. Such plays on words, because they please us so, persuade us more than their logical content merits. Certain shapes of phrasing do the same thing. Antithesis provides perhaps the best example

of this second kind of tacit persuasion magic. As a habit of mind, antithesis may well be intrinsic to how we think, part of the brain's now-familiar right and left hemi-sphericity. And, beginning with Darwin (in *The Expression of the Emotions in Man and Animals*), it has been argued that human gesture, too, seems to operate on antithetical principles. If a dog stands erect and bristles its hair as an evolutionary gesture of defiance, then flat hair and a lowly, cringing posture may develop by antithesis - as a formal rather than an evolutionary posture. However persuasive these long-range explanations, clearly antithesis taps a deep power somewhere; its use as a tacit bargaining pattern occurs far too often to be caused by chance. And again, not only powerful but dead easy to work. The root pattern is called "chiasmus" because, diagrammed, it forms an "X" and the Greek word for X is *chi*. When John Kennedy constructed his famous bromide "Ask not what your country can do for you but what you can do for your country," he went to the Well of Antithesis for his active ingredient. Where does the "X" power come from?

<i>Ask not</i>	what your country	can do for you
<i>But</i> what you can do for your country.		

Obviously a verbal judo is at work here. By keeping the phrase but inverting its meaning we use our opponent's own power to overcome him, just as a judo expert does. So a scholar remarked of another's theory, "Gannon entertains that theory because that theory entertains Cannon." The pun on "entertain" complicates the chiasmus here, but the judo still prevails - Cannon is playing with the power of his own mind rather than figuring out the secrets of the universe.

The New Testament uses chiasmus repeatedly to suggest the fundamental reciprocity of human ethics, the tacit bargain that we ignore at our peril. Just think about how much New Testament wisdom comes in this form. Not only "Do unto others as you would have them do unto you," but:

The first shall be last and
the last shall be first.

Judge not, that ye be not judged.

For with what judgment ye judge, ye
shall be judged.

And with what measure ye mete it
shall be measured to you again.

He that findeth his life shall lose it; and
he that loseth his life for my sake shall find it.

For judgment I am come into this world,
that they which see not might see, and that
they which see might be blind.

Such a persistent pattern can suggest balance and inversion of all kinds. Here it points insistently to the absolute inversion of worldly values which Christian ethics implies, a 180-degree reversal which literally makes the last into the first.

The X-pattern sometimes almost *defines* words. Professional football players, for example, use a chiasmus proverb to think about injuries:

If you're sick you don't play

If you play you're not sick

What's going on here? The X seems to establish two different, mutually exclusive roles. It excludes, *by its form*, the temptation to stand in the middle - play, but if you don't play well, blame it on being sick. The X-form provides precisely the diagrammatic force a player needs, the force to separate experience into two mutually exclusive camps. The player makes a tacit bargain with himself. Pattern supplies reassurance.

Winston Churchill used the X-form differently, but still for reassurance, in his famous Mansion House speech in November of 1942. He said, of the African campaign, "This is not the end. It is not even the beginning of the end. But it is perhaps, the end of the beginning." Not *cheap* reassurance. Don't get your hopes up. Don't mistake the first chapter for the last. But, still, yes, get your *long-term* hopes up, because I've imposed a pattern on the war: beginning-end of beginning-beginning of end-end. The AB-BA flip-flop suggests a reversal of fortune by its very shape. You know where you are, and the "logic of the pattern" will ultimately carry you to victory, because the end of the beginning leads - by the X-form logic - to the beginning of the end. As always, Churchill takes pleasure in verbal pattern for its own sake, and this too consoles us. Only strong men can enjoy word games while in grave danger. Ultimate cool.

George Bernard Shaw varies this form in an exchange about sexual chastity in *Man and Superman*.

Dona Ana: Don Juan: a word against chastity is an insult to me.

Don Juan: I say nothing against your chastity, Sefiora, since it took the form of a husband and twelve children. What more could you have done had you been the most abandoned of women?

Dona Ana: I could have had twelve husbands and no children, that's what I could have done.

Don Juan's strong serve right on the line is slammed directly back in his face.

We might, as a last instance of this most obvious tacit bargaining pattern, instance former Attorney General John Mitchell's stirring words about the Watergate disaster: "When the going gets tough, the tough get going." Sounds great, huh? Hard times bring out the greatness in the great. Alas, as John Dean saw when he passed this apothegm on from Mitchell to posterity, the reversal-logic here suggests another and opposite meaning: "When the going gets tough, sensible people take the first train out." Dean's suggested redefinition was cleverly turned but it only reemphasizes the tacit-persuasion logic chiasmus always invokes: the second half of the assertion seems to follow inevitably from the first because the shape of the phrasing says so. The two

senses of Mitchell's epigram are diametrically opposed, but both depend on the same tacit-persuasion power that chiasmus, by the nature of its symmetrical geometry, seems to create.

Repetition works almost as strongly as X inversion. Instead of ABBA, we get ABAB. I open the *Viking Book of Aphorisms* at random and find:

To be engaged	in opposing wrong
affords but slender guarantee	for being right.

Let not thy will	roar
when thy power can but	whisper.

Antithesis still works here, but in the words alone. The pattern is ABAB, the sense ABBA. The ABAB parallelism draws the opposing poles of meaning so close together that magnetic force can flow between them. This magnetic pattern is often the basic form for aphorism. So here. The aphorist piles "opposing wrong" on top of "being right" and "be engaged" on top of "affords slender guarantee." Often, as here, one of the pairs, A or B, generates more electricity than the other. But not always.

Let not	<i>thy will</i>	<i>roar</i>
when	<i>thy power</i>	can but <i>whisper.</i>

Here A and B work with equal strength. Sometimes this equal kind of pattern seems too pat, a little cute. Unequal pairs seem to work better as in this proverb from the great UCLA basketball coach, John Wooden:

Don't let what you can't do
Interfere with what you can do.

As someone addicted to just this folly, I draw daily consolation from Wooden's exhortation. But why does it work so well? Where does the tacit persuasion come from? Well, somehow from those horizontal and vertical visual coordinates considered earlier. From the way "can't do" and "can do" are visually insulated from one another by "interfere."

The isocolon in these aphorisms operates with brute simplicity: equal length = equal entity. Then put two of them in parallel but make the sense an X-pattern, and the paradoxical electricity which galvanizes aphorism begins to flow. The terms may not really be so antithetical as the pattern implies, but the energetic quickness of the play hides this.

Patterns like these become templates for thinking; they both frame thinking and, by their formal "logic," urge certain thoughts upon us. To take a trivial instance, I just now got up from my desk to get a drink of water. I've been writing all morning and my hand has fallen asleep from cramp. As I was drinking the water my subconscious mind must have been thinking "I have written too much. I should stop for lunch." But this thought came *as an aphorism*:

Your hand can go to sleep	from writing too much
as well as	from writing too little.

The pattern somehow had prompted as well as formed the thought. This formal back-pressure works on several levels. Every argument has two sides, we like to say, but it may have seven or eight. It "has two sides" because for many reasons it proves convenient to give it two sides. The formal pressure manifest in tacit persuasion never lets up.

Two basic tacit persuasion patterns have now emerged, inversion and repetition, ABBA and ABAB. In this kind of visual geometry, there can be only one more, climax/anticlimax, an extension of the ABAB pattern either up or down. Since the aphorism reveals this geometry so clearly (since that clear geometry is what defines an aphorism!) let's stay with this form. Churchill said about the Battle of Britain pilots: "Never in the field of human conflict was so much owed by so many to so few." First, a simple root expansion,

A B A' B' A" B"
ABABAB - so much/so many/so few/.

But with complications. "Much" and "many" are alike (and so yoked by alliteration) but "few" stands opposite to them. A' repeats A but A" stands as an antithetical climax to it. "So much" and "so many" lead us to expect a third repetition instead of the antithesis. Climax, but based on an antithetical pattern.

We've seen *anaphora* (similar opening patterns) at work before. In the next example, Churchill uses it to build a straightforward climax, a repetition that grows but does not reverse itself:

We shall not flag or fail. We shall fight in France, we shall fight on the seas and oceans, we shall fight with growing confidence and growing strength in the air, we shall defend our island, whatever the cost may be, we shall fight on the beaches, we shall fight on the landing grounds, we shall fight in the fields and in the streets, we shall fight in the hills; we shall never surrender. *{Blood, Toil, Tears and Sweat: The Speeches of Winston Churchill, edited by David Cannadine, Boston: Houghton Mifflin, (1989)}*

The climactic progression stands out.

We shall not flag or fail.
We shall fight in France,
we shall fight on the seas and oceans,
we shall fight with growing confidence and growing strength in the air,
we shall defend our island, whatever the cost may be,
we shall fight on the beaches,
we shall fight on the landing grounds,
we shall fight in the fields and in the streets,
we shall fight in the hills;
we shall never surrender.

Nice symmetry, for a start. The "f" alliteration set up with "yiaɡ or fziV continues through "fight" to the climactic "we shall never surrender" with only one slight break in the middle, where "we shall de/end" defers the alliteration to the second syllable. This break states the general theme whose particulars are itemized before and after. *Before*, a survey of offensive fighting - in France, at sea, in the air; *after*, z survey of

where the fighting will occur if the enemy does invade - on the beaches and on the landing grounds (stage one), then fields and streets (stage two), then in the hills (stage three), and finally the climax - "we shall never surrender."

The whole pattern equalizes two kinds of statements: 1) where Britain will fight; 2) that she will defend the island, whatever the cost, will never surrender. The equalizing is done by the list and the list is paced by the summary comment ("we shall defend our island") halfway through and climaxed by "we shall never surrender." The form welds both processes into a chain of certainties. By our tacit agreement, Churchill's assertion becomes a proleptic fact. And, oddly enough, a kind of reversal occurs here too, for we are so sure the "no surrender" spirit prevails that we refuse to believe the invasion will succeed, the backward steps from landing ground to field to street to hills will be taken.

The *locus classicus* for the tacit persuasion patterns we have been discussing is a linguistically lunatic Elizabethan short novel, John Lyly's *Euphues*. Lyly came down to London from Oxford in the 1570s determined to make a splash. This otherwise commendable resolve issued in the publication of *Euphues, The Anatomy of Wit* (1578). *Euphues* is a prodigal-son type who goes to Naples, steals his best friend's girl, and after she jilts him, comes home to repent. Not much happens in the silly and sketchy plot, and if we read *Euphues* for the plot we really will hang ourselves. (Dr Johnson commented on the detailed psychological portraiture in Samuel Richardson's long novels: "Why, Sir, if you were to read Richardson for the story, your impatience would be so much fretted that you would hang yourself"). But when we read it for the style we're tempted to do the same thing. The book consists mostly of moralizing speeches, couched in a style so full of antithesis, isocolon, climax, and alliteration that it comes to be *about* tacit persuasion patterns. A typical sentence-paragraph:

When parents have more care how to leave their children wealthy than wise, and are more desirous to have them maintain the name than the nature of a gentleman; when they put gold into the hands of youth where they should put a rod under their girdle; when instead of awe they make them past grace and leave them rich executors of goods and poor executors of godliness - then it is no marvel that the son, being left rich by his father's will, becomes retchless by his own will.

Maybe a chart will help

When parents have more care how	to leave their	children
		wealthy than B'ise
and are more desirous	to have	them maintain
the reame than the nature of a gentleman;	when they put	gold into the hands of
youth where they should put a rod under their girdle	when instead of awe	
they make them past grace	and leave them	rich executors of goods and
		poor executors of godliness
then it is no marvel that the son	#eing left	rich by his father's will
	becomes	retchless by his own will.

The italicized alliteration only begins the game. It is intensified by word repetition ("executors ... executors"/"will... will" - this repetition is called *diacope*). The iso-

colon, stacking up phrases equal in length and structure, jumps off the chart. And there is hidden rhyme like the m#ntain/n#me/nature patterns. Antithetical words are pulled closer together by the alliteration: "wealthy/wise; name/nature; goods/ godliness." The goods/godliness pairing creates a kind of sight-and-sound slant pun. Good and God both sound and look somewhat alike, *as z/they* might be different forms of the same root word. The ABAB isocolons sometimes omit the second A:

leave their children	wealthy than
(leave their children)	wise
leave them	rich executors of goods and
(leave them)	poor executors of godliness.

But even here sometimes a smaller full ABAB pattern lurks:

A	B
rich executors	of goods
A	B
poor executors	of godliness

And the last pair of parallel phrases generates a Chinese box effect:

A	B
being left rich	by his father's will
becomes retchless	by his own will

Fair enough, but look at the chiasmus hidden in the A side:

A	B
left	rich
↖ ↗	
retch-	less
B	A

A self-generating dynamic operates between chiasmus and the double-isocolon (ABAB), each threatening to turn into, or overlay, the other. It begins to work in the goods/godliness contrast:

A	B
rich executors	of goods
↖ ↗	
poor executors	of godliness
A	B

Straightforward double-isocolon, but a reader of Lyly is so conditioned to antitheses that he starts to make them at the least suggestion. Chiasmus as well as double-isocolon has become *a way of perceiving*. So we start to cross them here:

<i>rich executors</i>	<i>goods</i>
<i>poor executors</i>	<i>godliness</i>

And out pops the central moral of this relentless moralizing: people poor in goods are rich in godliness and vice versa. Not always true? The proverbial wisdom disagrees and the tacit persuasion patterns have been enlisted to help convince us.

The sentence, with its "when... when... where... when... THEN" periodic suspension, constitutes a climactic syllogism which expresses the central theme of Lyly's prodigal son tale - prodigal sons are made, not born. They are the sons of prodigal fathers. A sensible point but stale. But look at it from Lyly's point of view. He didn't have anything new to say. In his moral world, nothing new was left to say. How make a splash, then? You let the tacit persuasion patterns generate the meaning for you. Finding yourself with nothing to say, you deliver yourself methodically into the arms of chance. Since you make a splash by being extreme, he does this extremely. And so *Euphues*, whatever help it may provide for prodigal sons, comes to be a tacit persuasion pattern-book of Lyly's method of composition which, in this respect, resembles John Cage's practice of composing using patterns from *I Ching*.

We see better illustrated here than in any other prose style I know the backpressure form exerts on thought. Vernon Lee, an acute student of English style, once called syntax "the cast left by long repeated acts of thought." Lyly turned this observation on its head, thought becoming the cast left by infinitely repeated tacit persuasion patterns.

Prose like this stands at the typographical interface between prose and poetry. Lyly maximizes the tension between horizontal and vertical coordinates which verse typography allows but prose typography does not. Lyly's prose wants to be diagrammed. Its pronounced visual coordinates allegorize a search for moral ones, form a geometrical analogue for the proverbial wisdom it heaps upon us.

Compulsively patterned prose like this is hard for us to take. The Elizabethans, on the other hand, loved it. It started a fad for such elaborate patterning, a fad which, unlike most fads, left a permanent trace after it faded away. It offered written English a new set of patterns, a hypotactic periodicity that contrasted sharply with the paratactic running style which had constituted the main road of prose up to that time. It made patterns that were tacit in Greek and Latin overt in English.

We don't like the compulsive repetition. But even more, we don't like the direction in which the intellectual current flows - from pattern to thought, rather than vice versa. We have thought, ever since this patterning was repudiated by the plain styles which followed upon the scientific revolution, that *thought came first*. Words only dress it up. Western educational history, until that time, mostly thought otherwise. Verbal patterns were instruments to think with, and they were taught as part of the training in how to think. Pattern/thought, pattern/thought, pattern/thought - a continuing oscillation. We shall see this pair of viewpoints return when we come to consider electronic text. Patterning there is dynamic and three-dimensional but, even more than with print or manuscript, exerts back-pressure on how we think, and how we learn to think.

One more tacit persuasion pattern - the list. It creates a world of equal integers which permits systematic search and arrangement. Metaphor generalizes experience. The list *iterates* it, describes the universe by describing each particular in it. It underlies more prose than we usually realize. Here's an egregious example, again from Shaw's *Man and Superman*. A born-again moralizing Don Juan meets the Devil in Hell, and proceeds to badmouth the beautiful people he meets there. The Devil

replies: "Senor Don Juan: you are uncivil to my friends." I'll render Don Juan's reply to this civil rejoinder directly in schematic form:

Pooh! why should I be civil to them or to you? In this Palace of Lies a truth or two will not hurt you. Your friends are all the dullest dogs I know.

They are not beautiful: they are only decorated. They are not clean: they are only shaved and starched. They are not dignified: they are only fashionably dressed. They are not educated: they are only college passmen. They are not religious: they are only pewrenters. They are not moral: they are only conventional. They are not virtuous: they are only cowardly.

They are not even vicious: they are only "frail."

They are not artistic: they are only lascivious.
They are not prosperous: they are only rich. They are not loyal: they are only servile;

not dutiful, only sheepish;
not public spirited, only patriotic;
not courageous, only quarrelsome;
not determined, only obstinate;
not masterful, only domineering;
not self-controlled, only obtuse;
not self-respecting, only vain;
not kind, only sentimental;
not social, only gregarious;
not considerate, only polite;
not intelligent, only opinionated;
not progressive, only factious;
not imaginative, only superstitious;
not just, only vindictive;
not generous, only propitiatory;
not disciplined, only cowed;

and not truthful at all:
liars every one of them,
to the very backbone of their souls.

Don Juan is in harrowing hell, enumerating all its falsities, one by one. He uses the classic strategy of *epitheton*, here a string of paired epithets, one representing the truth, the other its hellish simulacrum. Once the list gets going, we accept its tacit logic, that experience can be adequately described by contrasting epithets. An introduction precedes the list; a ringing generalization ("liars every one of them") concludes it. The rocking rhythm is slightly varied midway by the variation I have emphasized: They are not *even* vicious: they are only "frail." The list builds, pair by pair, into a terrific rant. But, somewhere towards the end, we begin to wonder if Don Juan does not become imprisoned by his formula. The game of pairing, the formal pleasure, takes over from the thought. We begin, that is, to look *at* the list rather than through it. I've encouraged

this process, of course, by my reformatting and color coding. In regular consecutive prose on the page, and especially when spoken aloud, they carry us along in the rush.

Shaw meant us, though, to think about this list as a list, to notice the argumentative power of the tacit bargaining formula he employs. We can tell by the comment which immediately follows the list. Don Juan's listeners include not only the Devil but The Statue, the illustrious Commander of the Calatrava, the father of Doiia Ana, whom Don Juan, in life, had slain in a swordfight. They are all friends now - that already-mentioned devilish civility of Hell - and the Commander's response is enthusiastic.

Your flow of words is simply amazing, Juan. How I wish I could have talked like that to my soldiers.

The Commander is admiring the list *as a list*, looking *at* it rather than *through* it, he praises it as a rhetorical effect. There is no better way to deflate an opponent's argument than to praise the manner of its delivery. It is an old Hollywood putdown: "Wow! Terrific! Who writes your stuff?" Shaw uses Don Juan both to advance an argument and to illustrate the power of tacit-bargaining verbal patterns.

A list creates a world of equal integers which permits systematic search and arrangement. It underlies more prose than we usually realize. Lyly uses it all the time:

If I be	in Crete	I can lie
if	in Greece	I can shift
if	in Italy	I can court it.
I can carouse		with Alexander
abstain		with Romulus
eat		with the epicure
fast		with the Stoic
sleep		with Endymion
watch		with Chrysippus

The list aims to exhaust the riches of the universe, to have been everywhere and to have done everything. The list is based on fraudulent conversion from numerical extension to infinity, from quantity to quality. List enough items and you'll have grasped the essence, generalized, grasped intuitively. It's not true, but it seems so.

The basic tacit persuasion patterns - the antithesis and balance of the "X" and "double-isocolon" patterns, the climax often built upon them, and the iterative listing as alternate to climax - often develop into one another.

Taken together, they seem to represent all the basic patterns available. Not many styles are so compulsive as to be *about* these patterns but many use them. For example, from the *Declaration of Independence*:

When in the Course of human events, it becomes necessary for one people to dissolve the political bands which have connected them with another, and to assume among the Powers of the earth, the separate and equal station to which the Laws of Nature and of

Nature's God entitle them, a decent respect to the opinions of mankind requires that they should declare the causes which impel them to the separation.

Our old friend the "when-then" syllogism, the "then" being understood ("entitle them, *then* a decent... "). Then the lists start:

We hold these truths to be self-evident: that
 all men are created equal
 that they are endowed by their Creator with certain unalienable Rights That
 among these are Life, Liberty and the Pursuit of Happiness that to secure
 these rights... that whenever any form of Government...

The list form is stressed by the repeated "that"s. Take them out and the tacit-persuasion list pattern submerges:

We hold several truths to be self-evident. All men have been created equal and endowed with certain unalienable Rights, by their Creator. These rights include Life, Liberty and the Pursuit of Happiness. To secure these rights Men institute governments which derive their just powers from the consent of the governed. Whenever any form of Government...

Notice how the climax ("Life, Liberty and the Pursuit of Happiness") loses power without the listing to play off against? You can deflate the whole document simply by subtracting the anaphora. Try it:

He has refused his Assent to Laws, the most wholesome and necessary for the public good.
 He has forbidden his Governors to pass Laws of immediate and pressing importance, unless suspended in their operation till his Assent should be obtained...
 He has refused to pass other Laws for the accommodation of large districts of people, unless those people would relinquish the right of Representation in the Legislature...
 He has called together legislative bodies at places unusual, uncomfortable and distant from the depository of their Public Records...
 He has dissolved Representative Houses repeatedly, for opposing with manly firmness his invasions on the rights of the people.
 He has refused for a long time, after such dissolutions, to cause others to be elected...
 He has endeavoured to prevent the population of these States; for that purpose obstructing the Laws of Naturalization of Foreigners; refusing to pass others to encourage their migration hither, and raising the conditions of new Appropriations of Lands...
 For protecting them, by a mock Trial, from Punishment for any Murders which they should commit on the Inhabitants of these States:
 For cutting off our Trade with all parts of the world:
 For imposing taxes on us without our Consent:
 For depriving us in many cases, of the benefits of Trial by Jury:
 For transporting us beyond Seas to be tried for pretended offences...

And so on, through several more repetitions. Exhausting but exhaustive, a damning list as reductively egalitarian as the political philosophy it argues for - all these sins equal, all equally sinful.

Such repetitive patterning makes *Euphues* look like a model of restraint. Why doesn't it vex us as much? Familiarity makes us look through it rather than at it, of course. But mostly, we feel that its august subject - a political revolution - *deserves* the pomp of such ceremonial repetition. Feeling the list *as a list* intensifies the egalitarian argument. The double-isocolon patterns emerge here as a direct formal implication of the anaphora-list-making.

A	B
He has refused his Assent to Laws,	the most wholesome and necessary B'
A' He has	
forbidden his Governors to pass	of immediate and pressing importance
laws	B
A He has	
dissolved Representative Houses	for opposing
A' He	B'
has refused	after such dissolutions

A suggestion of chiasmus:

The two lines of the X differ in kind: polyptoton creates the "dissolved" axis synonym but not the "opposing-refused" one. A double-I pattern lurks below the surface in other places, too. For example:

A	B
unless suspended in their operation	till his Assent
A'	B'
when so suspended he has utterly neglected	to attend to them.

And *tricolon*, three-element climax, occurs as well, here reinforced by *anaphora* through *homoiooteleuton* (similar endings):

He has endeavored to prevent the population of these States;
 for that purpose
 obstructing the Laws of Naturalization of Foreigners:
 refusing to pass others to encourage their migration hither and
 raising the conditions of new Appropriations of Lands.

The chiasmus here more often than not hesitates on the brink of self-consciousness:

Or happening on a scale too large to notice:

A	B
He has combined with others to subject us to a jurisdiction foreign to our constitution,	and unacknowledged by our Laws
A'	B'
giving his assent to their acts	of pretended legislation

A and A' are yoked by his *combining* and his *assenting*; B and B' by "laws" and "legislation." And isn't there an X-pattern suggested too?

The whole document moves from list-making through the parallelism, balance, and antithesis that come from chiasmus and isocolon to the resolution of tricolon climax. The balance and antithesis patterns don't declare themselves; the list pattern blows a trumpet. And so, at the end, does the resonating *tricolon*:

we mutually pledge to each other
our Lives
our Fortunes and
our sacred Honor.

How could anyone resist this? And that is what the tacit persuasion patterns are all about, forming the path of least resistance. In their ideal form they have the nice symmetry we have seen: list <—> X and double-I <—> climax. They constitute, in fact, as we can now see, the basic beginning <—> middle <—> ending strategies for sentences. Put them to work in actual prose and they grow so complex that, like the other exploratory patterns we've been examining in these chapters, they become less a component of style than style itself, the inevitability that revolutions seek in events themselves and find so often only in the words used to describe them.

A Brief Glossary of Rhetorical Terms"

Classical rhetoric was divided into five parts:

- 1 Invention
- 2 Arrangement
- 3 Style
- 4 Memory
- 5 Delivery

And into three areas of use:

- 1 Deliberative (to debate in political bodies)
- 2 Judicial (to plead in law courts)
- 3 Epideictic or Panegyric (to praise, blame, or show off)

alloiosis. Breaking down a subject into alternatives:

Your tax accountant, on the pros and cons of taking a chancy deduction: "You can either eat well or sleep well."

For a fuller listing, see Richard A. Lanham, *A Handlist of Rhetorical Terms* (Berkeley: University of California Press, 1969).

amplificatio. A generic term for all the ways an argument can be expanded and enriched. *anadiplosis.* Repetition of the last word of one line or clause to begin the next. *anacoluthon.* Ending a sentence with a different construction from that with

which it began.

anaphora. Repetition of the same word at the beginning of successive clauses or verses:

It is the most grievous consequence of what we have done and of what we have left undone in the last five years.-. five years of futile good intentions, five years of eager search for the line of least resistance, five years of uninterrupted retreat of British power, five years of neglect of our air defences. *anthymeria.* Using one part of speech for another:

Who *authored* this tripe, anyway?

antistrophe. See *epiphora.*

aporia. True or feigned doubt or deliberation about an issue:

"Dora is rather difficult to -I would not, for the world, say, to rely upon, because she is the soul of purity and truth - but rather difficult to -I hardly know how to express it, really, Agnes."

apostrophe. Breaking off a speech or conversation to address a person or thing absent:

"Mother, dear, you should have lived to see this!"

cataphoresis. A wildly unlikely metaphor:

"Mom will have kittens when she hears this."

chiasmus. The order in the second half of an expression reverses that of the first:

"When the going gets tough, the tough get going." Or, as in the old Mark Cross slogan:

"Everything for the horse but the rider and everything for the rider but the horse." The term is derived from the Greek letter X (chi), whose shape, if the two halves of the construction are diagrammed, it resembles.

When the going gets tough

the tough* get going

climax. Mounting by degrees through words or sentences of increasing weight and in parallel construction:

So a Victorian schoolmaster rebuked a dilatory student who wouldn't learn Latin vowel quantities: "If you do not take more pains, how can you ever expect to write good longs and shorts? If you do not write good longs and shorts, how can you ever be a man of taste? If you are not a man of taste, how can you ever be of use in the world?"

Repetition of a word or words in succeeding clauses.

conduplicatio. Correction or revision of a word or phrase used previously.

correctio. Repetition of a word or phrase with one or more words in between:

didcope. "Give me strength, O Lord, give me strength!"

<i>effictio.</i>	<p>The head-to-toe inventory of a person's charms once so common in English poetry:</p> <p>"My Lady's hair is threads of beaten gold, Her front the purest Chrystal eye hath seen, Her eyes the brightest stars the heavens hold ..." and so on. A general term for vivid, vigorous description.</p>
<i>enargia.</i>	Division of subject into adjuncts, cause into effects, antecedent into
<i>enumeratio.</i>	<p>consequents:</p> <p>"How do I love thee? Let me count the ways. I love thee to the depth and breadth and height..."</p> <p>Intensive <i>anaphora</i>.</p>
<i>epanaphora.</i>	Frequent repetition of phrase or question, dwelling on a point. Opposite
<i>epimone.</i>	of <i>anaphora</i> , repetition of a word or phrase at the end of several clauses
<i>epiphora.</i>	or sentences:
	<p>"When I was a child, I spake as a child, I understood as a child, I thought as a child." Repeated or regular qualification of a noun by an appropriate adjective; an adjective that regularly accompanies a noun, as in "heartfelt thanks." Emphatic repetition of a word with no words in between:</p>
<i>epitheton.</i>	<p>"O Horror! Horror! Horror!" Putting oneself into the character of another so as to express that person's thoughts and feelings more vividly.</p>
<i>epizeuxis.</i>	
<i>ethopoeia.</i>	The character or set of emotions which a speaker reenacts in order to affect an audience. Use of a series of words with similar endings:
<i>ethos.</i>	<p>"The expression of the <i>function</i> of the facilitator of the condemnation of the amputee," as a licensed bureaucrat might put it. Raising questions and answering them. Every clause</p>
<i>homoioteleuton.</i>	<p>in a sentence has its own subject and verb:</p> <p>"Madame, the guests are come, supper served up, you called, my young lady asked for, the nurse cursed in the pantry, and everything in extremity." A succession of phrases of equal length and corresponding structure:</p>
<i>hypophora.</i>	
<i>hypozeuxis.</i>	<p>"Never in the history of mankind have so many owed so much to so few." Denial of the contrary, understatement in order to intensify:</p>
<i>isocolon.</i>	<p>"I am not unacquainted with the pleasures of money, for I love the stuff!" Belittling</p>
	comparison:
<i>litotes.</i>	<p>"Banker's hot rod" for a Ferrari coupe Substitution of cause for effect (or vice versa) or proper name for quality (or vice versa):</p>
	So Winston Churchill wrote to his wife during WW II, "I can't
<i>meiosis.</i>	tell you how we are coming but we're coming by puff-puff."
<i>metonymy.</i>	

occupatio. Emphasizing a point by pointedly seeming to pass it over:

"I will not discuss his criminal record, his several jail terms, the daring escape and bloody recapture - bygones are bygones."

oxymoron. A condensed paradox:

"Icy hot," "darkness visible," "act naturally" *paramologia*. Conceding a point to seem fair; giving away a weaker point to make a stronger:

"Of course I stole; what mother with starving children would do otherwise?"

parechesis. Repeating the same sound in words close together:

"Gaunt as the ghastliest of glimpses that gleam through the gloom of the gloaming when ghosts go aghast." *paromoiosis*. Use of similar sounds to reinforce isocolon:

"Seeing the sincere affection of the mind cannot be expressed by the mouth and that no art can unfold the entire love of the heart, I am earnestly to beseech you not to measure the firmness of my faith by the fewness of my words."

pathos. A general term for any kind of rhetorical figure which appeals directly to the emotions of an audience. *Ethos*, then, is the emotional set of the speaker; *pathos*, the emotional set the speaker wants to evoke in the audience.

ploce. Repetition of a word with a different meaning after the interval of another word or words:

"On the walls were pictured groups of early Americans signing things and still earlier Americans shooting arrows at things. But all over the immaculate mushroom-coloured carpet, and in what could be seen of a sort of Empire-style room opening off on the left, stood groups of present-day Americans drinking things."

polyptoton. Repetition of words from the same root but in different forms or with different endings:

"Society is no comfort to one not sociable." *synecdoche*.

Substitution of part for whole, genus for species, or vice versa:

"All hands on deck."

tapinosis. Debasing language or epithet:

"Rhymester" for "poet"

Often synonymous with *meiosis*.

tricolon. The pattern of three phrases in parallel, so common in Western writing after Cicero:

"Clear leadership, violent action, rigid decisions, one way or the other, form the only path not only of victory, but of safety and even of mercy."

trope. A rhetorical figure (metaphor, for example) which changes the meaning of a phrase. A *trope* is usually contrasted with a *scheme* (*isocolon*, for example), which only changes the shape of a phrase.

zeugma. One verb is made to govern several objects, each in a different way:

"Here thou, great *Anna!* whom three realms obey Dost sometimes counsel take - and sometimes Tea."

Not so much a Teaching as an Intangling

Stanley Fish

With the publication of *Surprised by Sin* in 1967, Stanley Fish launched a long, successful career as the most passionate defender of reader response criticism in the United States, a career that culminated with the publication of his humorously entitled *Is there a Text in this Class?* in 1980. In this selection from *Surprised by Sin*, Fish notices how John Milton manipulates his readers in order to advance his moral argument.

The right thing in speaking really is that we should be satisfied not to annoy our hearers, without trying to delight them: we ought in fairness to fight our case with no help beyond the bare facts: nothing, therefore, should matter except the proof of those facts. Still, as has been said, other things affect the result considerably, owing to the defects of our hearers.

ARISTOTLE, *Rhetoric*

(i) The Defects of our Hearers

I would like to suggest something about *Paradise Lost* that is not new except for the literalness with which the point will be made: (1) the poem's centre of reference is its reader who is also its subject; (2) Milton's purpose is to educate the reader to an awareness of his position and responsibilities as a fallen man, and to a sense of the distance which separates him from the innocence once his; (3) Milton's method is to re-create in the mind of the reader (which is, finally, the poem's scene) the drama of the Fall, to make him fall again exactly as Adam did and with Adam's troubled clarity, that is to say, 'not deceived'. In a limited sense few would deny the truth of my first two statements; Milton's concern with the ethical imperatives of political and social behaviour would hardly allow him to write an epic which did not attempt to give his audience a basis for moral action; but I do not think the third has been accepted in the way that I intend it.

A. J. A. Waldock, one of many sensitive readers who have confronted the poem since 1940, writes: '*Paradise Lost* is an epic poem of singularly hard and definite outline, expressing itself (or so at least would be our first impressions) with unmistakable clarity and point.' In the course of his book Waldock expands the reservation indicated by his parenthesis into a reading which predicates a disparity between Milton's intention and his performance:

In a sense Milton's central theme denied him the full expression of his deepest interests. It was likely, then, that as his really deep interests could not find outlet in his poem in the right way they might find outlet in the wrong way. And to a certain extent they do; they find vents and safety-valves often in inopportune places. Adam cannot give Milton much scope to express what he really feels about life; but Satan is there, Satan gives him scope. And the result is that the balance is somewhat disturbed; pressures are set up that are at times disquieting, that seem to threaten more than once, indeed, the equilibrium of the poem.

The 'unconscious meaning' portion of Waldock's thesis is, I think, as wrong as his description of the reading experience as 'disquieting' is right. If we transfer the emphasis from Milton's interests and intentions which are available to us only from a distance, to our responses which are available directly, the disparity between intention and execution becomes a disparity between reader expectation and reading experience; and the resulting 'pressures' can be seen as part of an intelligible pattern. In this way we are led to consider our own experience as a part of the poem's subject.

By 'hard and definite outline' I take Waldock to mean the sense of continuity and direction evoked by the simultaneous introduction of the epic tradition and Christian myth. The 'definiteness' of a genre classification leads the reader to expect a series of formal stimuli - martial encounters, complex similes, an epic voice - to which his response is more or less automatic; the hardness of the Christian myth predetermines his sympathies; the union of the two allows the assumption of a comfortable reading experience in which conveniently labelled protagonists act out rather simple roles in a succession of familiar situations. The reader is prepared to hiss the devil off the stage and applaud the pronouncements of a partisan and somewhat human deity who is not unlike Tasso's 'il Padre eterno'. But of course this is not the case; no sensitive reading of *Paradise Lost* tallies with these expectations, and it is my contention that Milton ostentatiously calls them up in order to provide his reader with the shock of their disappointment. This is not to say merely that Milton communicates a part of his meaning by a calculated departure from convention; every poet does that; but that Milton consciously wants to worry his reader, to force him to doubt the correctness of his responses, and to bring him to the realization that his inability to read the poem with any confidence in his own perception is its focus.

Milton's programme of reader harassment begins in the opening lines; the reader, however, may not be aware of it until line 84 when Satan speaks for the first time. The speech is a powerful one, moving smoothly from the *exdramatio* of 'But O how fall'n' (84) to the regret and apparent logic of 'till then who knew / The force of those dire Arms' (93-4), the determination of 'courage never to submit or yield' (108) and the grand defiance of 'Irreconcilable to our grand Foe, / Who now triumphs, and in th' excess of joy / Sole reigning holds the Tyranny of Heav'n' (122-4). This is our first view of Satan and the impression given, reinforced by a succession of speeches in Book I, is described by Waldock: 'fortitude in adversity, enormous endurance, a certain splendid recklessness, remarkable powers of rising to an occasion, extraordinary qualities of leadership (shown not least in his salutary taunts)'. But in each case Milton follows the voice of Satan with a comment which complicates, and according to some, falsifies, our reaction to it:

So spake th' Apostate Angel, though in pain,
Vaunting aloud, but rackt with deep despair.
(125-6)

Waldock's indignation at this authorial intrusion is instructive:

If one observes what is happening one sees that there is hardly a great speech of Satan's that Milton is not at pains to correct, to damp down and neutralize. He will put some glorious thing in Satan's mouth, then, anxious about the effect of it, will pull us gently by the sleeve, saying (for this is what it amounts to): 'Do not be carried away by this fellow: he *sounds* splendid, but take my word for it--- ' Has there been much despair in what we have just been listening to? The speech would almost seem to be incompatible with that. To accept Milton's comment here... as if it had a validity equal to that of the speech itself is surely very naive critical procedure... in any work of imaginative literature at all it is the demonstration, by the very nature of the case, that has the higher validity; an allegation can possess no comparable authority. Of course they should agree; but if they do not then the demonstration must carry the day. (pp. 77-8)

There are several assumptions here:

- (1) There is a disparity between our response to the speech and the epic voice's evaluation of it.
- (2) Ideally, there should be no disparity.
- (3) Milton's intention is to correct *his* error.
- (4) He wants us to discount the effect of the speech through a kind of mathematical cancellation.
- (5) The question of relative authority is purely an aesthetic one. That is, the reader is obliged to hearken to the most dramatically persuasive of any conflicting voices.

Of these I can assent only to the first. The comment of the epic voice unsettles the reader, who sees in it at least a partial challenge to his own assessment of the speech. The implication is that there is more (or less) here than has met the ear; and since the only ear available is the reader's, the further implication is that he has failed in some way to evaluate properly what he has heard. One must begin by admitting with Waldock the impressiveness of the speech, if only as a *performance* that commands attention as would any forensic *tour de force*; and attention on that level involves a corresponding inattention on others. It is not enough to analyse, as Lewis and others have, the speciousness of Satan's rhetoric. It is the nature of sophistry to lull the reasoning process; logic is a safeguard against a rhetorical effect only after the effect has been noted. The deep distrust, even fear, of verbal manipulation in the seventeenth century is a recognition of the fact that there is no adequate defence against eloquence at the moment of impact. (The appeal of rhetoric was traditionally associated with the weakness of the fallen intellect - the defect of our hearers; its fine phrases flatter the desires of the cupiderous self and perpetuate the disorder which has reigned in the soul since the Fall.) In other words one can analyse the process of deception only after it is successful. The reader who is stopped short by Milton's rebuke (for so it is) will, perhaps, retrace his steps and note more carefully the inconsistency of a Tyranny that involves an excess of joy, the perversity of 'study of revenge, immortal hate' (a line that had slipped past him sandwiched respectably between will and courage), the sophistry of the transfer of power from the 'Potent

Victor' of 95 to the 'Fate' of 116, and the irony, in the larger picture, of 'that were *low* indeed' and 'in *foresight* much advanc't. The fit reader Milton has in mind would go further and recognize in Satan's finest moment - 'And courage never to submit or yield' - an almost literal translation of *Georgic* IV. 84, 'usque adeo obnixi non cedere'. Virgil's 'praise' is for his bees whose heroic posturing is presented in terms that are at least ambiguous:

ipsi per medias acies insignibus alis ingentes animos
angusto in pectore versant, usque adeo obnixi non
cedere, dum gravis aut hos aut hos versa fuga victor
dare terga subegit. hi motus animorum atque haec
certamina tanta pulveris exigui iactu compressa
quiescunt.

(82~7)⁵

If we apply these verses to Satan, the line in question mocks him and in the unique time scheme of *Paradise Lost* looks both backward (the Victor has already driven the rebel host to flight) and forward (in terms of the reading experience, the event is yet to come). I believe that all this and more is there, but that the complexities of the passage will be apparent only when the reader has been led to them by the necessity of accounting for the distance between his initial response and the *obiter dictum* of the epic voice. When he is so led, the reader is made aware that Milton is correcting not a mistake of composition, but the weakness all men evince in the face of eloquence. The error is his, not Milton's; and when Waldock invokes some unidentified critical principle ('they should agree') he objects to an effect Milton anticipates and desires.

But this is more than a stylistic trick to ensure the perception of irony. For, as Waldock points out, this first epic interjection introduces a pattern that is operative throughout. In Books I and II these 'correctives' are particularly numerous and, if the word can be used here, tactless. Waldock falsifies his experience of the poem, I think, when he characterizes Milton's countermands as gentle; we are not warned ('Do not be carried away by this fellow'), but accused, taunted by an imperious voice which says with no consideration of our feelings, 'I know that you *have been* carried away by what you have just heard; you should not have been; you have made a mistake, just as I knew you would'; and we resent this rebuke, not, as Waldock suggests, because our aesthetic sense balks at a clumsy attempt to neutralize an unintentional effect, but because a failing has been exposed in a context that forces us to acknowledge it. We are angry at the epic voice, not for fudging, but for being right, for insisting that we become our own critics. There is little in the human situation more humiliating in both senses of the word, than the public acceptance of a deserved rebuke.

Not that the reader falls and becomes one of Satan's party. His involvement in the speech does not *directly* compromise his position in a God-centred universe, since his response (somewhat unconscious) is to a performance rather than to a point of view that he might be led to adopt as his own. As Michael Krouse notes, 'the readers for whom Milton wrote... were prepared for a Devil equipped with what appear on the surface to be the best of arguments' (*Milton's Samson and the Christian Tradition*, p. 102). As a Christian who has been taught every day to steel himself against diabolical wiles, the reader is more than prepared to admit the justness of the epic voice's

judgment on Satan. It is the phrase 'vaunting aloud' that troubles, since it seems to deny even the academic admiration one might have for Satan's art as apart from his morality and to suggest that such admiration can never really be detached from the possibility of involvement (if only passive) in that morality. The sneer in 'vaunting' is aimed equally at the performance and anyone who lingers to appreciate it. (Satan himself delivers the final judgment on this and on all his speeches at iv. 83: 'Whom I seduc'd/With other promises and other *vaunts*'¹.) The danger is not so much that Satan's argument will persuade (one does not accord the father of lies an impartial hearing), but that its intricacy will engage the reader's attention and lead him into an error of omission. That is to say, in the attempt to follow and analyse Satan's soliloquy, the larger contexts in which it exists will be forgotten. The immediate experience of the poetry will not be qualified by the perspective of the poem's doctrinal assumptions. Arnold Stein writes, 'the formal perspective does not force itself upon Satan's speech, does not label and editorialize the impressive wilfulness out of existence; but rather sets up a dramatic conflict between the local context of the immediate utterance and the larger context of which the formal perspective is expression. This conflict marks... the tormented relationship between the external boast and the internal despair.' Stein's comment is valuable, but it ignores the way the reader is drawn into the poem, not as an observer who coolly notes the interaction of patterns (this is the mode of Jonsonian comedy and masque), but as a participant whose mind is the *locus* of that interaction. Milton insists on this since his concern with the reader is necessarily more direct than it might be in any other poem; and to grant the reader the status of the slightly arrogant perceiver-of-ironies Stein invents would be to deny him the full *benefit* (I use the word deliberately, confident that Milton would approve) of the reading experience. Stein's 'dramatic conflict' is there, as are his various perspectives, but they are actualized, that is translated into felt meaning, only through the more pervasive drama (between reader and poem) I hope to describe.

A Christian failure need not be dramatic; if the reader loses himself in the workings of the speech even for a moment, he places himself in a compromising position. He has taken his eye from its proper object - the glory of God, and the state of his own soul - and is at least in danger. Sin is a matter of degrees. To think 'how fine this all sounds, even though it is Satan's', is to be but a few steps from thinking, 'how fine this all sounds' - and no conscious qualification. One begins by simultaneously admitting the effectiveness of Satan's rhetoric and discounting it because it *is* Satan's, but at some point a reader trained to analyse as he reads will allow admiration for a technical skill to push aside the imperative of Christian watchfulness. To be sure, this is not sin. But from a disinterested appreciation of technique one moves easily to a grudging admiration for the technician and then to a guarded sympathy and finally, perhaps, to assent. In this case, the failure (if we can call it that) involves the momentary relaxation of a vigilance that must indeed be eternal. Richard Baxter (*The Saints Everlasting Rest*, c. 1650) warns: 'Not only the open profane, the swearer, the drunkard, and the enemies of godliness, will prove hurtful companions to us, though these indeed are chiefly to be avoided: but too frequent society with persons merely civil and moral, whose conversation is empty and unedifying, may much divert our thoughts from heaven.' In Book ix, Eve is 'yet sinless' when she talks with Satan and follows him to the forbidden tree; but Milton indicates the danger and its vehicle at line 550:

Into the heart of Eve his words made way,
Though at the voice much marvelling.

Eve (innocently) surrenders her mind to wonderment ('much marvelling') at the technical problem of the seeming-serpent's voice ('What may this mean? Language of Man pronounc't / By Tongue of Brute') and forgets Adam's injunction to 'strictest watch' (363). There is at least one assertion of Satan's that Eve should challenge, since it contradicts something she herself has said earlier. The proper response to Satan's salutatory 'Fairest resemblance of thy Maker fair' (538) has been given, in effect, by Eve when she recognizes Adam's superior 'fairness' at iv. 490 ('I... see / How beauty is excell'd by manly grace / And wisdom, which alone is truly fair'). Her failure to give that response again is hardly fatal, but it does involve a deviation (innocent but dangerous) from the strictness of her watch. Of course to rebuke the serpent for an excess in courtesy might seem rude; tact, however, is a social virtue and one which Milton's heroes are rarely guilty of. Eve is correct when she declares that the talking serpent's voice 'claims attention due' (566), but attention *due* should not mean *complete* attention. Satan is the arch-conjurer here, calling his audience's attention to one hand (the mechanics of his articulation), doing his real work with the other ('Into the heart of Eve his words made way'). In Book i, Milton is the conjurer: by naming Satan he disarms us, and allows us to feel secure in the identification of an enemy who traditionally succeeds through disguise (serpent, cherub). But as William Haller notes, in *The Rise of Puritanism*, nothing is more indicative of a graceless state than a sense of security: 'Thus we live in danger, our greatest danger being that we should feel no danger, and our safety lying in the very dread of feeling safe' (New York/London, 1957, p. 156). Protected from one error (the possibility of listening sympathetically to a disguised enemy) we fall easily into another (spiritual inattentiveness) and fail to read Satan's speech with the critical acumen it demands. In the opening lines of Book x, Milton comments brusquely on Adam's and Eve's fall:

For still they knew, and ought to have still remember'd. (12)

Paradise Lost is full of little moments of forgetfulness - for Satan, for Adam and Eve, and, most important, for the reader. At i. 125-6, the epic voice enters to point out to us the first of these moments and to say in effect, ' "For still you knew and ought to have still remembered," remembered who you are (Paradise has already been lost), where you are ("So spake th'Apostate Angel")', and what the issues are (salvation, justification). In this poem the isolation of an immediate poetic effect involves a surrender to that effect, and is a prelude to error, and possibly to sin. Milton challenges his reader in order to protect him from a mistake he must make before the challenge can be discerned. If this seems circular and even unfair, it is also, as I shall argue later, necessary and inevitable.

The result of such encounters is the adoption of a new way of reading. After I. 125-6 the reader proceeds determined not to be caught out again; but invariably he is. If Satanic pronouncements are now met with a certain caution, if there is a new willingness to search for complexities and ironies beneath simple surfaces, this mental armour is never quite strong enough to resist the insidious attack of verbal power; and always the irritatingly omniscient epic voice is there to point out a deception

even as it succeeds. As the poem proceeds and this little drama is repeated, the reader's only gain is an awareness of what is happening to him; he understands that his responses are being controlled and mocked by the same authority, and realizes that while his efforts to extricate himself from this sequence are futile, that very futility becomes a way to self-knowledge. *Control* is the important concept here, for my claim is not merely that this pattern is in the poem (it would be difficult to find one that is not), but that Milton (*a*) consciously put it there and (*b*) expected his reader to notice it —

The lesson in both poems is that the only defence against verbal manipulation (or appearances) is a commitment that stands above the evidence of things that are seen, and the method of both poems is to lead us beyond our perspective by making us feel its inadequacies and the necessity of accepting something which baldly contradicts it. The result is instruction, and instruction is possible only because the reader is asked to observe, analyse, and *place* his experience, that is, to think about it.

In the divorce tracts Milton reveals the source of this poetic technique when he analyses the teaching of Christ, 'not so much a teaching, as an intangling'.⁷ Christ is found 'not so much interpreting the Law with his words, as referring his owne words to be interpreted by the Law'. Those who would understand him must themselves decipher the obscurities of his sayings, 'for Christ gives no full comments or continu'd discourses... scattering the heavenly grain of his doctrin like pearle heer and there, which requires a skilfull and laborious gatherer.' In order better to instruct his disciples, who 'yet retain'd the infection of loving old licentious customs', he does not scruple to mislead them, temporarily: 'But why did not Christ seeing their error informe them? for good cause; it was his profest method not to teach them all things at all times, but each thing in due place and season... the Disciples took it [one of his gnomic utterances] in a manifest wrong sense, yet our Saviour did not there informe them better ____ Yet did he not omitt to sow within them the seeds of sufficient determining, agen the time that his promis'd spirit should bring all things to their memory.' 'Due season' means when they are ready for it, and they will be ready for it when the seeds he has sown obliquely have brought them to the point where a more direct revelation of the truth will be efficacious; until then they are allowed to linger in error or at least in partial ignorance. Recently H. R. MacCallum has shown how Michael uses just this strategy of indirection and misdirection to lead Adam from the sickness of despair to faith and spiritual health.¹¹ Michael's strategy in Book xi is Milton's strategy in the entire poem, whereby his reader becomes his pupil, taught according to his present capacities in the hope that he can be educated, in tract of time, to enlarge them. By first 'intangling' us in the folds of Satan's rhetoric, and then 'informing us better' in 'due season', Milton forces us to acknowledge the *personal* relevance of the Arch-fiend's existence; and, in the process, he validates dramatically one of western man's most durable commonplaces, the equation of the rhetorical appeal (representative of the world of appearances) with the weakness of the 'natural man', that is, with the 'defects of our hearers'.

(ii) Yet Never Saw

The wariness these encounters with demonic attraction make us feel is part of a larger pattern in which we are taught the hardest of all lessons, distrust of our own

abilities and perceptions. This distrust extends to all the conventional ways of knowing that might enable a reader to locate himself in the world of any poem. The questions we ask of our reading experience are in large part the questions we ask of our day-to-day experience. Where are we, what are the physical components of our surroundings, what time is it? And while the hard and clear outline of *Paradise Lost* suggests that the answers to these questions are readily available to us, immediate contexts repeatedly tell us that they are not. Consider, for example, the case of Satan's spear. I have seen responsible critics affirm, casually, that Satan's spear is as large as the mast of a ship; the poem of course affirms nothing of the kind, but more important, it deliberately encourages such an affirmation, at least temporarily:

His spear, to equal which the tallest Pine
Hewn on *Norwegian* Hills to be the Mast
Of some great Ammiral, were but a wand.
(I. 292—+)

Throughout *Paradise Lost*, Milton relies on the operation of three truths so obvious that many critics fail to take them into account: (1) the reading experience takes place in time, that is, we necessarily read one word after another; (2) the childish habit of moving the eyes along a page and back again is never really abandoned although in maturity the movement is more mental than physical, and defies measurement; therefore the line as a unit is a resting place even when rhyme is absent; (3) a mind asked to order a succession of rapidly given bits of detail (mental or physical) seizes on the simplest scheme of organization which offers itself. In this simile, the first line supplies that scheme in the overt comparison between the spear and the tallest pine, and the impression given is one of equality. This is not necessarily so, since logically the following lines could assert any number of things about the relationship between the two objects; but because they are objects, offering the mind the convenience of focal points that are concrete, and because they are linked in the reading sequence by an abstract term of relationship (equal), the reader is encouraged to take from the line an image, however faint and wavering, of the two side by side. As he proceeds that image will be reinforced, since Milton demands that he attach to it the information given in 293 and the first half of 294; that is, in order to maintain the control over the text that a long syntactical unit tends to diminish, the reader will accept 'hewn on *Norwegian* hills' as an adjunct of the tallest pine in a very real way. By providing a scene or background (*memoria*) the phrase allows him to strengthen his hold on what now promises to be an increasingly complex statement of relationships. And in the construction of that background the pine frees itself from the hypothetical blur of the first line; it is now real, and through an unavoidable process of association the spear which stood in an undefined relationship to an undefined pine is seen (and I mean the word literally) in a kind of apposition to a conveniently visual pine. (This all happens very quickly in the mind of the reader who does not have time to analyse the cerebral adjustments forced upon him by the simile.) In short, the equation (in size) of the two objects, in 292 only a possibility, is posited by the reader in 292-4 because it simplifies his task; and this movement towards simplification will be encouraged, for Milton's fit reader, by the obvious reference in 'to be the Mast / Of some great Ammiral' to the staff of the Cyclops Polyphemus, identified in the *Aeneid* as a lopped pine¹² and likened in the *Odyssey* to 'the mast of some black ship of twenty oars'.

The construction of the image and the formulation of the relationship between its components are blocked by the second half of line 294, 'were but a wand'. This does several things, and I must resort to the mechanical aid of enumeration:

(1) In the confusion that follows this rupture of the reading sequence, the reader loses his hold on the visual focal points, and is unable to associate firmly the wand with either of them. The result is the momentary diminution of Satan's spear as well as the pine, although a second, and more wary reading, will correct this; but corrected, the impression remains (in line 295 a miniature Satan supports himself on a wand-like spear) and in the larger perspective, this aspect of the simile is one of many instances in the poem where Milton's praise of Satan is qualified even as it is bestowed.

(2) The simile illustrates Milton's solution of an apparently insoluble problem. How does a poet provide for his audience a perspective that is beyond the field of its perception? To put the case in terms of *Paradise Lost*, the simile as it functions in other poems will not do here. A simile, especially an epic simile, is an attempt to place persons and/or things, perceived in *a* time and *a* space, in the larger perspective from which their significance must finally be determined. This is possible because the components of the simile have a point of contact - their existence in the larger perspective - which allows the poem to yoke them together without identifying them. Often, part of the statement a simile makes concerns the relationship between the components and the larger perspective in addition to the more obvious relationship between the components themselves; poets suggest this perspective with words like smaller and greater. Thus a trapped hero is at once like and unlike a trapped wolf, and the difference involves their respective positions in a hierarchy that includes more than the physical comparison. A complex and 'tight' simile then can be an almost scientific description of a bit of the world in which for 'the immediate relations of the crude data of experience' are substituted 'more refined logical entities, such as relations between relations, or classes of relations, or classes of classes of relations'. In Milton's poem, however, the components of a simile often do not have a point of contact that makes their comparison possible in a meaningful (relatable or comprehensible) way. A man exists and a wolf exists and if categories are enlarged sufficiently it can be said without distortion that they exist on a comparable level; a man exists and Satan (or God) exists, but any statement that considers their respective existences from a human perspective, however inclusive, is necessarily reductive, and is liable to falsify rather than clarify; and of course the human perspective is the only one available. To return to Book I, had Milton asserted the identity of Satan's spear and the tallest pine, he would not only have sacrificed the awe that attends incomprehensibility; he would also have lied, since clearly the *personae* of his extra-terrestrial drama are not confined within the limitations of our time and space. On the other hand, had he said that the spear is larger than one can imagine, he would have sacrificed the concreteness so necessary to the formulation of an effective image. What he does instead is grant the reader the convenience of concreteness (indeed fill his mind with it) and then tell him that what he sees is not what is there ('there' is never located). The result is almost a feat of prestidigitation: for the rhetorical negation of the scene so painstakingly constructed does not erase it; we are relieved of the necessity of believing the image true, but permitted to retain the solidity it offers our straining imaginations. Paradoxically, our awareness of the inadequacy of what is described and what we can apprehend

provides, if only negatively, a sense of what cannot be described and what we cannot apprehend. Thus Milton is able to suggest a reality beyond this one by forcing us to feel, dramatically, its unavailability.

(3) Finally, the experience of reading the simile tells us a great deal about ourselves. How large is Satan's spear? The answer is, we don't know, although it is important that for a moment we think we do. Of course, one can construct, as James Whaler does, a statement of relative magnitudes (Spear is to pine as pine is to wand)¹⁵ but while this may be logical, it is not encouraged by the logic of the reading experience which says to us: If one were to compare Satan's spear with the tallest pine the comparison would be inadequate. I submit that any attempt either to search out masts of Norwegian ships or to determine the mean length of wands is irrelevant.

Another instance may make the case clearer. In Book in, Satan lands on the Sun:

There lands the Fiend, a spot like which perhaps
Astronomer in the Sun's lucent Orb Through his
glaz'd optic Tube yet never saw.

(588-90)

Again in the first line two focal points (spot and fiend) are offered the reader who sets them side by side in his mind; again the detail of the next one and one half lines is attached to the image, and a scene is formed, strengthening the implied equality of spot and fiend; indeed the physicality of the impression is so persuasive that the reader is led to join the astronomer and looks with him through a reassuringly specific telescope ('glaz'd optic Tube') to see - nothing at all ('yet never saw'). In both similes the reader is encouraged to assume that his perceptions extend to the object the poet would present, only to be informed that he is in error; and both similes are constructed in such a way that the error must be made before it can be acknowledged by a surprised reader. (The parallel to the rhetorical drama between demonic attraction and authorial rebuke should be obvious.) For, however many times the simile is re-read, the 'yet never saw' is unexpected. The mind cannot perform two operations at the same time, and one can either cling to the imminence of the disclaimer and repeat, silently, ' "yet never saw" is coming, "yet never saw" is coming', or yield to the demands of the image and attend to its construction; and since the choice is really no choice at all - after each reading the negative is only a memory and cannot compete with the immediacy of the sensory evocation - the tail-like half line always surprises.

Of course Milton wants the reader to pull himself up and re-read, for this provides a controlled framework within which he is able to realize the extent and implication of his difficulty, much like the framework provided by the before and after warnings surrounding Belial's speech. The implication is personal; the similes and many other effects say to the reader: 'I know that you rely upon your senses for your apprehension of reality, but they are unreliable and hopelessly limited.' Significantly, Galileo is introduced in both similes; the Tuscan artist's glass represents the furthest extension of human perception, and that is not enough. The entire pattern, of which the instances I analyse here are the smallest part, is, among other things, a preparation for the moment in Book vin when Adam responds to Raphael's astronomical dissertation: 'To whom thus Adam clear'd of doubt'. Reader reaction is involuntary: cleared of doubt? by that impossibly tortuous and equivocal description of two all too probable universes?¹⁶ By this point, however, we are able to place our reaction, since

Adam's experience here parallels ours in so many places (and a large part of the poem's meaning is communicated by our awareness of the relationship between Adam and ourselves). He *is* cleared of doubt, not because he now knows how the universe is constructed, but because he knows that he cannot know; what clears him of doubt is the certainty of self-doubt, and as with us this certainty is the result of a superior's willingness to grant him, momentarily, the security of his perspective. Milton's lesson is one that twentieth-century science is just now beginning to learn:

Finally, I come to what it seems to me may well be from the long-range point of view the most revolutionary of the insights to be derived from our recent experiences in physics, more revolutionary than the insights afforded by the discoveries of Galileo and Newton, or of Darwin. This is the insight that it is impossible to transcend the human reference point __ The new insight comes from a realization that the structure of nature may eventually be such that our processes of thought do not correspond to it sufficiently to permit us to think about it at all.¹⁷

In *Paradise Lost*, our sense of time proves as illusory as our sense of space and physicality. Jackson Cope quotes with approval Sigfried Giedion and Joseph Frank, who find in modern literature a new way of thinking about time:

The flow of time which has its literary reflection in the Aristotelian development of an action having beginning, middle and end is... frozen into the labyrinthine planes of a spatial block which... can only be perceived by travelling both temporally and physically from point to point, but whose form has neither beginning, middle, end nor center, and must be effectively conceived as a simultaneity of multiple views.

And Mrs. Isabel MacCaffrey identifies the 'simultaneity of multiple views' with the eternal moment of God, a moment, she argues, that Milton makes ours:

The long view of time as illusory, telescoped into a single vision, had been often adopted in fancy by Christian writers__ Writing of Heaven and the little heaven of Paradise, Milton by a powerful releasing act of the imagination transposed the intuitive single glance of God into the poem's mythical structure. Our vision of history becomes for the time being that of the Creator 'whose eye Views all things at one view' (ii. 189—90); like him, we are stationed on a 'prospect high Wherin past, present, future he beholds.'

(iii. 77-8)¹⁹

The experience of every reader, I think, affirms the truth of these statements; Milton does convince us that the world of his poem is a static one which 'slights chronology in favor of a folded structure which continually returns upon itself, or a spiral that circles about a single center'. The question I would ask is how does he so convince us? His insistence on simultaneity is easily documented. How many times do we see Christ ascend, after the war in Heaven, after the passion, after Harrowing Hell, after giving Satan his death wound, after the creation, after the final conflagration, at the day of final judgment? How many times do our first parents fall, and how many times are they accorded grace? The answer to all these questions is, 'many times' or is it all the time (at each point of time) or perhaps at one, and the same, time. My difficulty with the preceding sentence is a part of my point: I cannot let go of the word 'time' and the idea of sequence; timelessness (I am forced to resort to a

question-begging negative) is an interesting concept, but we are all of us trapped in the necessity of experiencing in time, and the attempt even to conceive of a state where words like day and evening measure space rather than duration is a difficult one; Chaucer's *Troilus*, among others, is defeated by it. Mrs. MacCaffrey asserts that 'spatial imagining' is part of Milton's 'mental climate' and the researches of Walter Ong, among others, support her; but if Milton has implanted the eternal moment 'into the poem's mythical structure', how does the reader, who, in Cope's words, must travel 'temporally and physically from point to point', root it out? Obviously many readers do not; witness the critics who are troubled by contradictory or 'impossible' sequences and inartistic repetitions. Again the reactions of these anti-Miltonists are the surest guide to the poet's method; for it is only by encouraging and then 'breaking' conventional responses and expectations that Milton can point his reader beyond them. To return to Waldo, part of the poem's apparently 'hard and definite' outline is the easy chronology it seems to offer; but the pressures of innumerable local contexts demand adjustments that give the lie to the illusion of sequence and reveal in still another way the inability of the reader to consider this poem as he would any other.

In the opening lines of Book I, chronology and sequence are suggested at once in what is almost a plot line: man disobeys, eats fruit, suffers woe and awaits rescue. It is a very old and simple story, one that promises a comfortable correlation of plot station and emotional response: horror and fear at the act, sorrow at the result, joy at the happy ending, the whole bound up in the certain knowledge of cause and effect. As Milton crowds more history into his invocation the reader, who likes to know what time it is, will attempt to locate each detail on the continuum of his story line. The inspiration of the shepherd, Moses, is easily placed between the Fall and the restoration; at this point many readers will feel the first twinge of complication, for Moses is a type of Christ who as the second Adam restores the first by persevering when he could not; as one begins to construct statements of relationship between the three, the clarity of lines 1-3 fades. Of course there is nothing to force the construction of such statements, and Milton thoughtfully provides in the very next line the sequence-establishing phrase, 'In the Beginning'. Reassured both by the ordering power of 'beginning' and by the allusion to Genesis (which is, after all, the original of all once-upon-a-times), the reader proceeds with the invocation, noting, no doubt, all the riches unearthed by generations of critical exegesis, but still firmly in control of chronology; and that sense of control is reinforced by the two-word introduction to the story proper: 'Say first', for with the first we automatically posit a second and then a third, and in sum, a neat row of causal statements leading all the way to an end already known.

The security of sequence, however, is soon taken away. I have for some time conducted a private poll with a single question: 'What is your reaction when the second half of line 54 - "for *now* the thought" - tells you that you are *now* with Satan, in Hell?' The unanimous reply is, 'surprise', and an involuntary question: how did I come to be here? Upon re-reading, the descent to Hell is again easy and again unchartable. At line 26 the time scheme is still manageable: there is (*a*) poem time, the *now* in which the reader sits in his chair and listens, with Milton, to the muse, and (*b*) the named point in the past when the story ('our Grand Parents... so highly to fall off) and our understanding of it ('say first what cause') is assumed to begin. At 33, the 'first' is set back to the act of Satan, now suggested but not firmly

identified as the 'cause' of 27, and a third time (*c*) is introduced, further from (*a*) than (*b*), yet still manageable; but Satan's act also has its antecedent: 'what time his Pride / Had cast him out from Heav'n (36-7); by this point, 'what time' is both an assertion and a question as the reader struggles to maintain an awkward, backward-moving perspective. There is now a time (*d*) and after (that is, before) that an (*e*) 'aspiring... He trusted to have equall'd the most High' (38, 40). Time (*f*) breaks the pattern, returning to (*d*) and providing, in the extended description of 44—53, a respite from sudden shifts. To summarize: the reader has been asked repeatedly to readjust his idea of 'in the beginning' while holding in suspension two plot lines (Adam's and Eve's and Satan's) that are eventually, he knows, to be connected. The effort strains the mind to its capacity, and the relief offered by the vivid and easy picture of Satan falling is more than welcome. It is at this time, when the reader's attention has relaxed, that Milton slips by him the 'now' of 54 and the present tense of 'torments', the first present in the passage. The effect is to alert the reader both to his location (Hell) and to his inability to retrace the journey that brought him there. Re-reading leads him only to repeat the mental occupations the passage demands, and while the arrival in Hell is anticipated, it is always a surprise. The technique is of course the technique of the spot and spear similes, and of the clash between involuntary response and authorial rebuke, and again Milton's intention is to strip from us another of the natural aids we bring to the task of reading. The passage itself tells us this in lines 50-1, although the message may pass unnoted at first: 'Nine times the Space that measures Day and Night'. Does space measure day and night? Are day and night space? The line raises these questions, and the half-line that follows answers them, not 'to mortal men' who think in terms of duration and sequence, not to us. In this poem we must, we will, learn a new time.

The learning process is slow at first; the reader does not necessarily draw the inferences I do from this early passage; but again it is the frequency of such instances that makes my case. In Book n, when the fallen Angels disperse, some of them explore 'on bold adventure' their new home. One of the landmarks they pass is 'Lethe the River of Oblivion', and Milton pauses to describe its part in God's future plans: 'At certain revolutions all the damn'd / ... They ferry over this *Lethean* Sound / Both to and fro, their sorrow to augment, / And wish and struggle, as they pass to reach / The tempting stream, with one small drop to lose / In sweet forgetfulness all pain and woe, / All in one moment and so near the brink; / But Fate withstands' (597-8, 604—10). At 614 the poet continues with 'Thus roving on / In confus'd march forlorn', and only the phrase 'advent'rous bands' in 615 tells the reader that the poet has returned to the fallen angels. The mistake is a natural one: 'forlorn' describes perfectly the state of the damned, as does 'Confus'd march' their movements 'to and fro': indeed a second reflection suggests no mistake at all; the fallen angels *are* the damned, and one drop of Lethe *would* allow them to lose their woe in the oblivion Moloch would welcome. Fate *does* withstand. What Milton has done by allowing this momentary confusion is to point to the identity of these damned and all damned. As they fly past Lethe the fallen angels are all those who will become them; they do not stand for their successors (the word defeats me), they *state* them. In *Paradise Lost*, history and the historical sense are denied and the reader is forced to see events he necessarily perceives in sequence as time-identities. Milton cannot recreate the eternal moment, but by encouraging and then blocking the construction of sequential relationships he can lead the reader to accept the necessity of, and

perhaps even apprehend, negatively, a time that is ultimately unavailable to him because of his limitations.

This translation of felt ambiguities, confusions, and tautologies into a conviction of timelessness in the narrative is assured partially by the uniqueness of Milton's 'fable'. 'For the Renaissance', notes Mrs. MacCaffrey, 'all myths are reflections, distorted or mutilated though they may be, of the one true myth.' For Milton all history is a replay of the history he is telling, all rebellions one rebellion, all falls one fall, all heroism the heroism of Christ. And his readers who share this Christian view of history will be prepared to make the connection that exists potentially in the detail of the narrative. The similes are particularly relevant here. The first of these compares Satan to Leviathan, but the comparison, to the informed reader, is a tautology; Satan *is* Leviathan and the simile presents two aspects of one, rather than the juxtaposition of two, components. This implies that Satan is, at the moment of the simile, already deceiving 'The Pilot of some small night-founder'd Skiff; and if the reader has attended to the lesson of his recent encounter with the epic voice he recognizes himself as that pilot, moored during the speech of i. 84—126 by the side of Leviathan. The contests between Satan and Adam, Leviathan and the pilot, rhetoric and the reader - the simile compresses them, and all deceptions, into a single instant, forever recurring. The celebrated falling-leaves simile moves from angel-form to leaves to sedge to Busiris and his Memphian Chivalry, or in typological terms (Pharaoh and Herod are the most common types of Satan) from fallen angels to fallen angels. The compression here is so complex that it defies analysis: the fallen angels as they *lie* on the burning lake (the Red Sea) are already *pursuing* the Sojourners of Goshen (Adam and Eve, the Israelites, the reader) who are for the moment *standing* on the safe shore (Paradise, the reader's chair). In Book xn. 191, Pharaoh becomes the River-Dragon or Leviathan (Isaiah xxvii. 1), pointing to the ultimate unity of the Leviathan and falling leaves similes themselves. As similes they are uninformative; how numberless are the falling angels? they are as numberless as Pharaoh's host, that is, as fallen angels, and Pharaoh's host encompasses all the damned who have been, are, and will be, all the damned who will fly longingly above Lethe. As vehicles of perception, however, they tell us a great deal, about the cosmos as it is in a reality we necessarily distort, about the ultimate subjectivity of sequential time, about ourselves.

There are many such instances in the early books and together they create a sensitivity to the difficulties of writing and reading this particular poem. When Milton's epic voice remarks that pagan fablers err relating the story of Mulciber's ejection from Heaven (i. 747), he does not mean to say that the story is not true, but that it is a distorted version of the story he is telling, and that any attempt to apprehend the nature of the angels' fall by comparing it to the fall of Mulciber or of Hesiod's giants involves another distortion that cannot be allowed if *Paradise Lost* is to be read correctly. On the other hand the attempt is hazarded (the reader cannot help it), the distortion is acknowledged along with the unavailability of the correct reading, and Milton's point is made despite, or rather because of, the intractability of his material. When Satan's flight from the judgment of God's scales (iv. 1015) is presented in a line that paraphrases the last line of the *Aeneid*, the first impulse is to translate the allusion into a comparison that might begin, 'Satan is like Turnus in that...'; but of course, the relationship as it exists in a reality beyond that formed by our sense of literary history, is quite the opposite. Turnus's defiance of the fates and his inevitable defeat are significant and comprehensible only in the light of what

Satan did in a past that our time signatures cannot name and is about to do in a present (poem time) that is increasingly difficult to identify. Whatever the allusion adds to the richness of the poem's texture or to Milton's case for superiority in the epic genre, it is also one more assault on the confidence of a reader who is met at every turn with demands his intellect cannot even consider.

(iii) The Good Temptation

Most poets write for an audience assumed fit. Why is the fitness of Milton's audience a concern of the poem itself? One answer to this question has been given in the preceding pages: only by forcing upon his reader an awareness of his limited perspective can Milton provide even a negative intuition of what another would be like; it is a brilliant solution to the impossible demands of his subject, enabling him to avoid the falsification of anthropomorphism and the ineffectiveness of abstraction. Another answer follows from this one: the reader who fails repeatedly before the pressures of the poem soon realizes that his difficulty proves its major assertions - the fact of the Fall, and his own (that is Adam's) responsibility for it, and the subsequent woes of the human situation. The reasoning is circular, but the circularity is appropriate to the uniqueness of the poem's subject matter; for while in most poems effects are achieved through the manipulation of reader response, this poet is telling the story that *created* and still creates the responses of its reader and of all readers. The reader who falls before the lures of Satanic rhetoric displays again the weakness of Adam, and his inability to avoid repeating that fall throughout indicates the extent to which Adam's lapse has made the reassertion of right reason impossible. Rhetoric is thus simultaneously the sign of the reader's infirmity and the means by which he is brought first to self-knowledge, and then to contrition, and finally, perhaps, to grace and everlasting bliss.

St. Paul articulates the dilemma of fallen man when he cries, 'For the good that I would I do not: but the evil which I would not, that I do' (Romans vii. 19). The true horror of the Fall is to be found here, in the loss of that happy state in which man's faculties worked in perfect harmony, allowing him accurately to assess his responsibilities and to meet them. Fallen man is hopelessly corrupt and his corruption resists even the grace freely offered to him through the intercession of Jesus Christ. Man's soul becomes the scene of a battle between the carnality of the first Adam (the old, unregenerate, man) and the righteousness of the second (the new, regenerate, man); and in the seventeenth century the image of an intestine warfare that is simultaneously the sign of the Fall and an indication of the possibility of redemption is to be seen everywhere:

There is in Man, by reason of his general *Corruption*, such a distemper wrought, as that there is not onely *crookednesse* in, but *dissension* also, and fighting betweene his parts: And, though the Light of our *Reason* be by Man's Fall much dimmed and decayed; yet the remainders thereof are so adverse to our unruly *Appetite*, as that it laboureth against us.

(Edward Reynolds, *A Treatise of the Passions and Faculties of the Sould of Man*, London, 1640)

Reason therefore may rightly discern the thing which is good, and yet the will of man not incline itself thereunto, as often the prejudice of sensible experience doth oversway.

(Hooker, *Ecclesiastical Polity*, I, vii. 6)

Our erected wit maketh us know what perfection is, and yet our infected will keepeth us from reaching unto it.

(Sidney, *Apology*)

Milton transforms this commonplace into a poetic technique; he leads us to feel again and again the conflict between the poem's assumed morality and our responses, and to locate the seat of that conflict in our fallen nature and not in any failure in composition. In short, the reader's difficulty is the result of the act that is the poem's subject. The reading experience becomes the felt measure of man's loss and since Milton always supplies a corrective to the reader's errors and distortions, what other critics have seen as the 'disquieting' aspect of that experience can be placed in a context that makes sense of it.

When, in the second part of *Pilgrim's Progress*, Christiana wonders why she and her companion Mercy were not forewarned of the danger lurking 'so near the Kings Palace' or, better still, provided with a 'Conductor', Reliever answers: 'Had my Lord granted you a Conductor, you would not neither, so have bewailed that oversight of yours in not asking for one, as now you have occasion to do. So all things work for good, and tend to make you more wary'; and Mercy adds, 'by this neglect, we have an occasion ministred unto us to behold our own imperfections'. With the same compassionate and deliberate neglect, Milton makes the whole of *Paradise Lost* just such an occasion, the poet's version of what the theologian calls a 'good temptation':

A good temptation is that whereby God tempts even the righteous for the purpose of proving them, not as though he were ignorant of the disposition of their hearts, but for the purpose of exercising or manifesting their faith or patience... or of lessening their self confidence, and reproving their weakness, that... they themselves may become wiser by experience.

The temptation is good because by means of it the secret corruption within is exposed, and consequently we are better able to resist the blandishments of less benevolent tempters. In the struggle against sin, no weapon is more effective than a knowledge of the areas likely to be under attack:

Thou must be carefull and diligent to finde out the subtilty, devices, and sleights of the devill, by which he doth assault thee very cunningly; for he hath a neere conjecture unto what sinnes thou art most inclined... and accordingly he fits his temptations.

{*A Garden of Spiritual! Flowers*, 1638, p. 285)

There is secret corruption within, which will never be found out but by searching ... the benefit is great which waysoever things turn. If upon examination we find that we have not grace in truth, then the mistake is discovered, and the danger prevented. If we find that we have grace, we may take the comfort of it.

(Thomas Watson, *Christian Soldier; Or, Heaven Taken By Storm*, 1669, p. 52)

I feelingly know the weakness of my own heart, and I am not ignorant of the Devil's malice and subtilty, and how he will make the fiercest assaults where I am weakest.

(John Corbet, *Self-Employment in Secret*, 1681, pp. 41-2)

The deceitfulness of man's heart is such, writes Daniel Dyke, that we should welcome 'fit occasions' of trial which 'give a vent to corruption'; for 'many are inwardly full of corruption; but they shew it not, onely for want of occasion' (*The Mystery of Self-Deceiving*, 1615, p. 329). It is our duty, insists John Shower, to 'bring [our] Hearts and Ways to a Trial, but 'most... are unwilling [because] they are stupidly secure and see not the necessity of this duty' (*Serious Reflections On Time And Eternity*, Glasgow, 1828, 1st edn., 1689, p. 175). Milton compels this duty by fitting temptations to our inclinations and then confronting us immediately with the evidence of our fallibility. And in the process, he fosters the intense self-consciousness which is the goal of spiritual self-examination:

When on the Sudden, and by Incogitancy I have spoken a Word, which upon Second Thoughts is doubtful to me, though I had not such doubt in the speaking of it, I have been much perplexed about it, and have engaged myself to a greater watchfulness.

(Corbet, *Self-Imloymerit*, p. 32)

And when upon this inquiry, we find we have contracted any sullages or pollutions, then we must cleanse them from that filth, and *take heed to them*, that is, keep a continual watch over them, and be still upon our guard, that we be not surpriz'd by any new Temptation.

(Edmund Arwaker, *Thoughts well Employ'd*, 1697, p. 21)

Note the similarity between the sequence of mental actions described by Corbet -mistake, correction, instruction - and my description of the reader's experience in Books i and n.

The long-range result of this technique is the creation of a 'split reader', one who is continually responding to two distinct sets of stimuli - the experience of individual poetic moments and the ever present pressure of the Christian doctrine - and who attaches these responses to warring forces within him, and is thus simultaneously the location and the observer of their struggle. This division in the reader is nowhere more apparent or more central to Milton's intention than in Book ix when Adam chooses to disobey. Waldock raised a very real question (which he then answered too quickly) when he argued that at its most crucial point, 'the poem asks from us, at one and the same time, two incompatible responses... that Adam did right, and... that he did wrong. The dilemma is as critical as that, and there is no way of escape.' Almost immediately Paul Turner replied by pointing out that the poet does not want us to escape: 'What would happen if... the reader did *not* feel inside himself a strong, almost overwhelming impulse to do what Adam did. What sort of significance... would remain?'⁷ The ambivalence of the response is meaningful because the reader is able to identify its components with different parts of his being: one part, faithful to what he has been taught to believe (his 'erected wit') and responsive to the unmistakable sentiments of the poem's official voice, recoils in the presence of what he *knows* to be wrong; but another part, subversive and unbidden (his 'infected will') surprises and overcomes him and Adam is secretly applauded. It would be a mistake to deny either of these impulses; they must be accepted and noted because the self must be accepted before it can be transformed. The value of the experience depends on the reader's willingness to participate in it fully while at the same time standing apart from it. He must pass judgment on it, at least on that portion of it which is a reflection of his weakness. So that if we retain Waldock's formula, a description of the total response would be, Adam

is wrong, no, he's right, but, then, of course he is wrong, and so am I. This last is not so much a product of the scene itself as of the moral conditioning the poem has exposed us to and of the self-consciousness it encourages. In effect the reader imposes this final certainty on the ambiguity of the poetic moment (this is the way of escape), but, in doing so, he does not deny its richness; indeed he adds to it by *ordering* it, by providing another perspective which gives the ambiguity meaning and renders it edifying; *he* now supplies the correcting perspective supplied earlier by the epic voice. Moreover, the uneasiness he feels at his own reaction to the fact of sin is a sign that he is not yet lost. The saint is known not by the absence of sin, but by his hatred of it:

First, before hee come to doe the sinne, he hath no purpose to doe it, but his purpose and desire is to doe the will of God, contrary to that sinne. Secondly, in the act of doing of the sinne, his heart riseth against it, yet by the force of temptation, and by the mighty violence of the flesh hee is haled on and pulled to do wickednesse. Thirdly, after hee hath sinned, he is sore displeased with himself for it and truly repenteth.

In the pattern I discern in the poem, the reader is continually surprised by sin and in shame, 'sore displeased with himself,' his heart 'riseth against it'.

One might ask at this point, why read a poem that treats its reader so badly? Why continue to suffer an experience that is unpleasant? The answer is simply that for the seventeenth-century Puritan and indeed for any Christian in what we might call the Augustinian tradition, the kind of discomfort I have been describing would be paradoxically a source of comfort and the unpleasantness a source of pleasure. Milton did not write for the atheist, but for the 'cold' Christian (neither saint nor apostate) who cannot help but allow the press of ordinary life to 'divert his thoughts from Heav'n'. In the same way, the sense of sin so necessary to a properly disposed Christian soul, is blunted rather than reinforced by the familiar recitation of scriptural commonplaces in sermons. One may hear every day of the depravity of natural man and of the inefficacy of unaided human efforts, but, inevitably, the incantational repetition of a truth lessens its immediate and personal force, and the sinner becomes complacent in a verbal and abstract contrition. *Paradise Lost* is immediate and forceful in the communication of these unflattering truths, again following the example of Christ who administers to the Pharisees 'not by the middling temper... but by the other extreme of *antidote*... a sharp & corrosive sentence against a foul and putrid licence; not to eate into the flesh, but into the sore'. In the manner of the Old Law, the poem is designed to 'call forth and develop our natural depravity;... that it might impress us with a slavish fear... that it might be a schoolmaster to bring us to the righteousness of Christ'. And since perpetual vexation and self-doubt are signs that the spirit of the Lord is at work, the reader welcomes an experience he knows to be salutary to his spiritual health; a 'good temptation' Milton points out 'is therefore rather to be desired'. 'They whose hearts are pierced by the Ministry of the word, they are carryed with love and respect to the Ministers of it' (Thomas Hooker).

It should be noted, in addition, that the reading offered here is a partial one. I have isolated this pattern in order to make a precise and rather narrow point about the way the poem works on one level. In Milton's larger scheme the conviction that man can do nothing is accompanied by the conviction that Christ has taken it upon himself to do it all. As Joseph Summers writes, in another context, 'The essential "act" is that the individual should abandon the pretence that he *can* act in any way pertaining to

salvation: he must experience the full realization that salvation belongs to God, that nothing he can do either by faith or works can help. The doctrine is moreover, "comforting", for "all things" are "more ours by being his" (*George Herbert*, p. 61). We are told this at the first - 'till one greater Man / Restore us and regain the blissfull Seat' - but in the course of our struggles with Books I and n, we *forget*, as Milton intends us to, so that we can be reminded dramatically by the glorious sacrifice of Book in. Milton impresses us with the negativity and despair of one aspect of Christian doctrine so that he can send us joyfully to the promise of another.

. Notes

- 1 *Paradise Lost and its Critics* (Cambridge, 1947), p. 15. I consider Waldock's book to be the most forthright statement of an anti-Miltonism that can be found in the criticism of Leavis and Eliot, and, more recently, of Empson, R. J. Zwi Werblowsky, H. R. Swardson and John Peter. Bernard Bergonzi concludes his analysis of Waldock by saying, 'no attempt has been made to defend the poem in the same detailed and specific manner in which it has been attacked' (*The Living Milton*, ed. Frank Kermode, London, 1960, p. 171). This essay is such an attempt. Bergonzi goes on to assert that 'a successful answer to Waldock would have to show that narrative structure of *Paradise Lost* does possess the kind of coherence and psychological plausibility that we have come to expect from the novel. Again there can be no doubt that it does not' (p. 174). I shall argue that the coherence and psychological plausibility of the poem are to be found in the relationship between its effects and the mind of its reader. To some extent my reading has been anticipated by Joseph Summers in his brilliant study, *The Muse's Method* (Harvard, 1962). See especially pp. 30-1: 'Milton anticipated... the technique of the "guilty reader" — The readers as well as the characters have been involved in the evil and have been forced to recognize and to judge their involvement.' See also Anne Ferry's *Milton's Epic Voice: The Narrator in Paradise Lost* (Harvard, 1963), pp. 44—66: 'We are meant to remember that the events of the poem have already occurred... and that it is because of what happens in the poem, because we and all men were corrupted by the Fall, that we stand in need of a guide to correct our reading of it. The narrative voice is our guide' (p. 47). Finally I refer the reader to Douglas Knight's excellent article, 'The Dramatic Center of *Paradise Lost*', *South Atlantic Quarterly* (1964), pp. 44-59, which reached me only after this manuscript was substantially completed. Mr. Knight argues, as I do, for the analytic nature of the reading experience. Our emphases are different (he focuses mainly on the similes) but our general conclusions accord perfectly: 'The poem's material and structure fuse as they put pressure on the reader to assess and estimate the place where he is to stand; Adam and Eve can almost be said to dramatize for him a mode of action which is his own if he reads the poem properly. For *Paradise Lost* is a work of art whose full achievement is one of mediation and interactivity among three things: a way of reading the poem, an estimate of it as a whole work, and a reader's proper conduct of his life' (pp. 56-7).
- 2 *Paradise Lost and its Critics*, p. 24.
- 3 *Ibid.*, p. 77.
- 4 The tradition begins with Plato's opposition of rhetoric to dialectic. Socrates' interlocutors *discover* the truth for themselves, when, in response to his searching questions, they are led to examine their opinions and, perhaps, to refute them. The rhetorician, on the other hand, creates a situation in which his auditors have no choice but to accept the beliefs he urges on them. In *The Testimony of the President, Professors, Tutors, and Hebrew Instructor of Harvard College in Cambridge, Against the Reverend Mr. George Whitefield, And his Conduct* (Boston, 1744), Whitefield is censured because of 'his power to raise the People to any Degree of Warmth he pleases, whereby they stand ready to receive almost any Doctrine he is pleased to broach...' (p. 13). The danger lies in the weakness of the fallen intellect which is more likely

to be swayed by appearances than by the naked presentation of the truth. In recognition of this danger, the Puritan preacher first sets out the points of doctrine in the form of a Ramist 'proof before turning in the 'uses' to the figures of exhortation. 'For a minister to lure men to an emotional reception of the creed before their imaginations had conceived it, before their intellects were convinced of it and their wills had deliberately chosen to live by it, was fully as immoral as openly to persuade them to wrong doing' (Perry Miller, *The New England Mind: The Seventeenth Century*, Beacon Press Edition, Boston, 1961, p. 308). A similar distrust of rhetoric manifests itself in the writings of the Baconian empiricists. Figurative language is said to be useless for the description of experiments or the formulation of conclusions, and rhetorical appeals are disdained because they dull intellects which should be alertly analytic. Bacon protests against the delivery (presentation) of knowledge 'in such form as may be best believed, and not as may be best examined' and advises instead 'the method of the mathematicues' (*Selected Writings*, ed. H. G. Dick, New York, 1955, p. 304). To Hobbes geometry is 'the only science that it has pleased God hitherto to bestow on mankind', a science which, as Aristotle said, no one uses fine language in teaching (*Leviathan*, ed. H. W. Schneider, New York, 1958, p. 41). Sprat believes that eloquence, 'this vicious volubility of *Tongue*' should be 'banish'd out of all *civil Societies*'¹ because the ornaments of speaking 'are in open defiance against *Reason*' and hold too much correspondence with the passions, giving the mind 'a motion too changeable, and bewitching, to consist with *right practice*' (*The History of the Royal Society of London*, 1667,

p. III) ____ Complementing the fear of rhetoric is a faith in the safeguards provided by the use of analytical method. Where one short-circuits the rational and panders to the emotions, the other speaks directly to the reason. Where one compels assent without allowing due deliberation, the other encourages the auditor or reader to examine the progress of a composition at every point, whether it be a poem, a sermon, or the report of an experiment. 'Now my plan', announces Bacon, 'is to proceed regularly and gradually from one axiom to another.' However complex the experiment, he proposes to 'subjoin a clear account of the manner in which I made it; that men knowing exactly how each point was made out, may see whether there be any error connected with it' (*Preface to the Great Instauration*, in *The English Philosophers From Bacon to Mill*, ed. E. A. Burtt, New York, 1939, p. 21). Puritan preachers dispose their texts with the same care so that their auditors can receive the discourse according to the manner of its composition. The focus is always on the mind, which must be led, step by step, and with a consciousness of an answering obligation, to a clear understanding of conceptual content. (Again we see the similarity to Platonic dialectic.) In writing *Paradise Lost*, then, Milton is able to draw upon a tradition of didacticism which finds its expression in a distrust of the affective and an insistence on the intellectual involvement of the listener-pupil; in addition he could rely on his readers to associate logic and the capacity for logical reasoning with the godly instinct in man, and the passions, to which rhetoric appeals, with his carnal instincts.

- 5 As Davis Harding points out (*The Club of Hercules*, Urbana, 111., 1962, pp. 103-8), this passage is also the basis of the bee simile at line 768. The reader who catches the allusion here at line 108 will carry it with him to the end of the book and to the simile. One should also note the parallel between the epic voice's comment at 126 and Virgil's comment on Aeneas' first speech (as Milton's early editors noted it): 'Talia voce refert, curisque ingentibus aeger/spem voltu simulat, premit altum corde dolorem'. But as is always the case in such comparisons, Satan suffers by it, since his deception is self-deception and involves an attempt to deny (to himself) the reality of an authority greater than his, while Aeneas' deception is, in context, an evidence of his faith in the promise of a higher authority. The hope he feigns is only partially a pretence; if it were all pretence, he would not bother.

- 6 *Answerable Style: Essays on Paradise Lost* (Minneapolis, 1953), p. 124. Frank Kermode's analysis in *The Living Milton* (p. 106) supports my position: 'He uses the epic poet's privilege of intervening in his own voice, and he does this to regulate the reader's reaction; but some of the effects he gets from this device are far more complicated than is sometimes supposed. The corrective comments inserted after Satan has been making out a good case for himself are not to be lightly attributed to a crude didacticism; naturally they are meant to keep the reader on the right track, but they also allow Milton to preserve the energy of the myth. While we are

hearing Satan we are not hearing the comment; for the benefit of a fallen audience the moral correction is then applied, but its force is calculatedly lower; and the long-established custom of claiming that one understands Satan better than Milton did is strong testimony to the tact with which it is done.' Anne Ferry (*Milton's Epic Voice*) is closer to Stein: 'The speech is meant to belie the inner experience and the comment to point out the power of the contradiction. Satan's words do not sound despairing precisely because the division within him is so serious. Only the inspired narrator can penetrate the appearance to discover the reality' (p. 120). Mrs. Ferry's discussion of this pattern focuses on her conception of the narrator as a divided being: 'These didactic comments remind us of the narrator's presence and his special vision in order that we may accept his moral interpretation of the story _____. They are not *opposed* to the action of the poem, but are part of the total pattern of that action, not checks upon our immediate responses to drama, but a means of expressing the speaker's double point of view, his fallen knowledge and his inspired vision' (p. 56). It seems to me that the didactic comments *are* checks upon our immediate responses; nor do I believe it an oversimplification 'to make the speaker' a judge 'who lectures us like a prig just when we are most involved in the story'. I agree whole-heartedly, however, with Mrs. Ferry's arranging of interpretative hierarchies: 'So that when we find complexity in our response to the behavior or speech of a character and to the statement of the narrator which interprets it, we must judge the character by the interpretation, not the interpretation by the character's words or acts' (p. 16). I would add (and this is the heart of my thesis) that we must judge ourselves in the same way.

- 11 'Milton and Sacred History: Books XI and XII of *Paradise Lost*' in *Essays in English Literature from the Renaissance to the Victorian Age*, Presented to A. S. P. Woodhouse, ed. Millar MacLure and F. W. Watt (Toronto, 1964), pp. 149-68.
- 12 iii. 659. Harding insists that 'if this passage does not conjure up a mental picture of Polyphemus on the mountaintop, steadying his footsteps with a lopped pine... it has not communicated its full meaning to us' (*The Club of Hercules*, p. 63). In my reading a 'full reading' of the passage involves the recognition of the inadequacy of the mental picture so conjured up.
- 13 The translation is E. V. Rieu's in the Penguin Classic Edition (Baltimore, 1946), p. 148.
- 14 A. N. Whitehead in *The Limits of Language*, ed. Walker Gibson (New York, 1962), pp. 13-14. In classical theory, metaphor is the figure of speech whose operation bears the closest resemblance to the operations of dialectic and logic. Aristotle defines it in the *Poetics* as 'a transference either from genus to species or from species to genus, or from species to species'.
- 15 'The Miltonic Simile', *PMLA*, xlii (1931), 1064.
- 16 Milton clearly anticipates this reaction when he describes the dialogue in the 'argument': 'Adam inquires concerning celestial Motions, is *doubtfully* answer'd' (emphasis mine). See also v. 261-6: 'As when by night the Glass / of *Galileo*, less assur'd, observes / Imagin'd Lands and Regions in the Moon: / Or Pilot from amidst the *Cyclades* / *Delos* or *Samos* first appearing kens / A cloudy spot.' It should be noted that in all these passages certain details form a consistent pattern: Galileo, the moon, spots (representing an unclear vision), etc. The pattern is fulfilled in Raphael's disquisition on the possible arrangement of the heavens. See Greene's excellent reading of Raphael's descent (*The Descent from Heaven*, p. 387): 'The fallen reader's imperfect reason must strain to make out relations as the pilot strains with his physical eyes, as Galileo strains with his telescope, as the fowls gaze with mistaken recognition on the angel, as Adam and Eve will fail to strain and so blur our vision.' See also Northrop Frye, *The Return of Eden* (Toronto, 1965), p. 58: 'Galileo thus appears to symbolize, for Milton, the gaze outward on physical nature, as opposed to the concentration inward on human nature, the speculative reason that searches for new places, rather than the moral reason that tries to create a new state of mind.'
- 17 P. W. Bridgman, quoted in *The Limits of Language*, p. 21.

David Pareus, quoted in Arnold Williams's *The Common Expositor* (Chapel Hill, NC, 1948), p. 113: 'God is said to try man not that he may discover what he does not know (he knows even our inmost thoughts), but that we may discover our weakness, which *we* do not know' (emphasis mine). In his 'Apology for his Book' Bunyan defends a method similar to Milton's: 'You see the ways the Fisher-man doth take / To catch the Fish; what Engines doth he make? /.... Yet Fish there be, that neither Hook, nor Line, / Nor Snare nor Net, nor Engine can make thine; / They must be grop'd for, and be tickled too, / Or they will not be catcht, what e're you do' (p. 3); 'This Book will make a Travailer of thee, / If by its Counsel thou wilt ruled be; / It will direct thee to the Holy Land, / If thou wilt its Directions understand; / Yea, it will make the sloathful active be; / The Blind also, delightful things to see' (pp. 6-7).

Interpretive Communities

Stanley Fish

This selection from Fish's most anthologized essay, "Interpreting the Variorum" (1976), contains his argument for a concept of interpretive communities, groups of readers who share a set of conventions for understanding literary works in certain ways. According to Fish, the formal properties of literary works exist only as they are activated by such communities of readers. Literature, in other words, is both production and consumption at once.

It seems then that the price one pays for denying the priority of either forms or intentions is an inability to say how it is that one ever begins. Yet we do begin, and we continue, and because we do there arises an immediate counterobjection to the preceding pages. If interpretive acts are the source of forms rather than the other way around, why isn't it the case that readers are always performing the same acts or a sequence of random acts, and therefore creating the same forms or a random succession of forms? How, in short, does one explain these two "facts" of reading? (1) The same reader will perform differently when reading two "different" (the word is in quotation marks because its status is precisely what is at issue) texts; and (2) different readers will perform similarly when reading the "same" (in quotes for the same reason) text. That is to say, both the stability of interpretation among readers and the variety of interpretation in the career of a single reader would seem to argue for the existence of something independent of and prior to interpretive acts, something which produces them. I will answer this challenge by asserting that both the stability and the variety are functions of interpretive strategies rather than of texts.

Let us suppose that I am reading *Lycidas*. What is it that I am doing? First of all, what I am not doing is "simply reading," an activity in which I do not believe because it implies the possibility of pure (that is, disinterested) perception. Rather, I am proceeding on the basis of (at least) two interpretive decisions: (1) that *Lycidas* is a pastoral and (2) that it was written by Milton. (I should add that the notions "pastoral" and "Milton" are also interpretations; that is, they do not stand for a set of indisputable, objective facts; if they did, a great many books would not now be getting written.) Once these decisions have been made (and if I had not made these I would have made others, and they would be consequential in the same way), I am immediately predisposed to perform certain acts, to "find," by looking for, themes (the relationship between natural processes and the careers of men, the efficacy of poetry or of any other action), to confer significances (on flowers, streams, shepherds, pagan deities), to mark out "formal" units (the lament, the consolation, the turn, the affirmation of faith, and so on). My disposition to perform these acts (and others; the list is not meant to be exhaustive) constitutes a set of interpretive

strategies, which, when they are put into execution, become the large act of reading. That is to say, interpretive strategies are not put into execution after reading (the pure act of perception in which I do not believe); they are the shape of reading, and because they are the shape of reading, they give texts their shape, making them rather than, as it is usually assumed, arising from them. Several important things follow from this account:

(1) I did not have to execute this particular set of interpretive strategies because I did not have to make those particular interpretive (pre-reading) decisions. I could have decided, for example, that *Lycidas* was a text in which a set of fantasies and defenses find expression. These decisions would have entailed the assumption of another set of interpretive strategies (perhaps like that put forward by Norman Holland in *The Dynamics of Literary Response*) and the execution of that set would have made another text.

(2) I could execute this same set of strategies when presented with texts that did not bear the title (again a notion which is itself an interpretation) *Lycidas, a Pastoral Monody*. I could decide (it is a decision some have made) that *Adam Bede*² is a pastoral written by an author who consciously modeled herself on Milton (still remembering that "pastoral" and "Milton" are interpretations, not facts in the public domain); or I could decide, as Empson did, that a great many things not usually considered pastoral were in fact to be so read; and either decision would give rise to a set of interpretive strategies, which, when put into action, would *write* the text I write when reading *Lycidas*. (Are you with me?)

(3) A reader other than myself who, when presented with *Lycidas*, proceeds to put into execution a set of interpretive strategies similar to mine (how he could do so is a question I will take up later), will perform the same (or at least a similar) succession of interpretive acts. He and I then might be tempted to say that we agree about the poem (thereby assuming that the poem exists independently of the acts either of us performs); but what we really would agree about is the way to write it.

(4) A reader other than myself who, when presented with *Lycidas* (please keep in mind that the status of *Lycidas* is what is at issue), puts into execution a different set of interpretive strategies will perform a different succession of interpretive acts. (I am assuming, it is the article of my faith, that a reader will always execute some set of interpretive strategies and therefore perform some succession of interpretive acts.) One of us might then be tempted to complain to the other that we could not possibly be reading the same poem (literary criticism is full of such complaints) and he would be right; for each of us would be reading the poem he had made.

The large conclusion that follows from these four smaller ones is that the notions of the "same" or "different" texts are fictions. If I read *Lycidas* and *The Waste Land* differently (in fact I do not), it will not be because the formal structures of the two poems (to term them such is also an interpretive decision) call forth different interpretive strategies but because my predisposition to execute different interpretive strategies will *produce* different formal structures. That is, the two poems are different because I have decided that they will be. The proof of this is the possibility of doing the reverse (that is why point 2 is so important). That is to say, the answer to the question "why do different texts give rise to different sequences of interpretive acts?" is that *they don't have to*, an answer which implies strongly that "they" don't exist. Indeed, it has always been possible to put into action interpretive strategies designed to make all texts one, or to put it more accurately, to be forever making the

same text. Augustine urges just such a strategy, for example, in *On Christian Doctrine* where he delivers the "rule of faith" which is of course a rule of interpretation. It is dazzlingly simple: everything in the Scriptures, and indeed in the world when it is properly read, points to (bears the meaning of) God's love for us and our answering responsibility to love our fellow creatures for His sake. If only you should come upon something which does not at first seem to bear this meaning, that "does not literally pertain to virtuous behavior or to the truth of faith," you are then to take it "to be figurative" and proceed to scrutinize it "until an interpretation contributing to the reign of charity is produced." This then is both a stipulation of what meaning there is and a set of directions for finding it, which is of course a set of directions - of interpretive strategies - for making it, that is, for the endless reproduction of the same text. Whatever one may think of this interpretive program, its success and ease of execution are attested to by centuries of Christian exegesis. It is my contention that any interpretive program, any set of interpretive strategies, can have a similar success, although few have been as spectacularly successful as this one. (For some time now, for at least three hundred years, the most successful interpretive program has gone under the name "ordinary language.")⁶ In our own discipline programs with the same characteristic of always reproducing one text include psychoanalytic criticism, Robertsonianism (always threatening to extend its sway into later and later periods), numerology (a sameness based on the assumption of innumerable fixed differences).

The other challenging question - "why will different readers execute the same interpretive strategy when faced with the 'same' text?" - can be handled in the same way. The answer is again that *they don't have to*, and my evidence is the entire history of literary criticism. And again this answer implies that the notion "same text" is the product of the possession by two or more readers of similar interpretive strategies.

But why should this ever happen? Why should two or more readers ever agree, and why should regular, that is, habitual, differences in the career of a single reader ever occur? What is the explanation on the one hand of the stability of interpretation (at least among certain groups at certain times) and on the other of the orderly variety of interpretation if it is not the stability and variety of texts? The answer to all of these questions is to be found in a notion that has been implicit in my argument, the notion of *interpretive communities*. Interpretive communities are made up of those who share interpretive strategies not for reading (in the conventional sense) but for writing texts, for constituting their properties and assigning their intentions. In other words, these strategies exist prior to the act of reading and therefore determine the shape of what is read rather than, as is usually assumed, the other way around. If it is an article of faith in a particular community that there are a variety of texts, its members will boast a repertoire of strategies for making them. And if a community believes in the existence of only one text, then the single strategy its members employ will be forever writing it. The first community will accuse the members of the second of being reductive, and they in turn will call their accusers superficial. The assumption in each community will be that the other is not correctly perceiving the "true text," but the truth will be that each perceives the text (or texts) its interpretive strategies demand and call into being. This, then, is the explanation both for the stability of interpretation among different readers (they belong to the same community) and for the regularity with which a single reader will

employ different interpretive strategies and thus make different texts (he belongs to different communities). It also explains why there are disagreements and why they can be debated in a principled way: not because of a stability in texts, but because of a stability in the makeup of interpretive communities and therefore in the opposing positions they make possible. Of course this stability is always temporary (unlike the longed for and timeless stability of the text). Interpretive communities grow larger and decline, and individuals move from one to another; thus, while the alignments are not permanent, they are always there, providing just enough stability for the interpretive battles to go on, and just enough shift and slippage to assure that they will never be settled. The notion of interpretive communities thus stands between an impossible ideal and the fear which leads so many to maintain it. The ideal is of perfect agreement and it would require texts to have a status independent of interpretation. The fear is of interpretive anarchy, but it would only be realized if interpretation (text making) were completely random. It is the fragile but real consolidation of interpretive communities that allows us to talk to one another, but with no hope or fear of ever being able to stop.

In other words interpretive communities are no more stable than texts because interpretive strategies are not natural or universal, but learned. This does not mean that there is a point at which an individual has not yet learned any. The ability to interpret is not acquired; it is constitutive of being human. What is acquired are the ways of interpreting and those same ways can also be forgotten or supplanted, or complicated or dropped from favor ("no one reads that way anymore"). When any of these things happens, there is a corresponding change in texts, not because they are being read differently, but because they are being written differently.

The only stability, then, inheres in the fact (at least in my model) that interpretive strategies are always being deployed, and this means that communication is a much more chancy affair than we are accustomed to think it. For if there are no fixed texts, but only interpretive strategies making them, and if interpretive strategies are not natural, but learned (and are therefore unavailable to a finite description), what is it that utterers (speakers, authors, critics, me, you) do? In the old model utterers are in the business of handing over ready-made or prefabricated meanings. These meanings are said to be encoded, and the code is assumed to be in the world independently of the individuals who are obliged to attach themselves to it (if they do not they run the danger of being declared deviant). In my model, however, meanings are not extracted but made and made not by encoded forms but by interpretive strategies that call forms into being. It follows then that what utterers do is give hearers and readers the opportunity to make meanings (and texts) by inviting them to put into execution a set of strategies. It is presumed that the invitation will be recognized, and that presumption rests on a projection on the part of a speaker or author of the moves *he* would make if confronted by the sounds or marks he is uttering or setting down.

It would seem at first that this account of things simply reintroduces the old objection; for isn't this an admission that there is after all a formal encoding, not perhaps of meanings, but of the directions for making them, for executing interpretive strategies? The answer is that they will only *be* directions to those who already have the interpretive strategies in the first place. Rather than producing interpretive acts, they are the product of one. An author hazards his projection, not because of something "in" the marks, but because of something he assumes to be in his reader. The very existence of the "marks" is a function of an interpretive community, for

they will be recognized (that is, made) only by its members. Those outside that community will be deploying a different set of interpretive strategies (interpretation cannot be withheld) and will therefore be making different marks.

So once again I have made the text disappear, but unfortunately the problems do not disappear with it. If everyone is continually executing interpretive strategies and in that act constituting texts, intentions, speakers, and authors, how can any one of us know whether or not he is a member of the same interpretive community as any other of us? The answer is that he can't, since any evidence brought forward to support the claim would itself be an interpretation (especially if the "other" were an author long dead). The only "proof of membership is fellowship, the nod of recognition from someone in the same community, someone who says to you what neither of us could ever prove to a third party: "we know." I say it to you now, knowing full well that you will agree with me (that is, understand) only if you already agree with me.

Notes

- 1 American reader-response critic (b. 1927), who employs psychoanalysis: *Dynamics* was published in 1968.
- 2 An 1859 novel by the English writer George Eliot.
- 3 William Empson (1906-1984), English critic and poet, whose works include *Some Versions of Pastoral* (1935).
- 4 A 1922 poem by the American-born poet and critic T. S. Eliot.
- 5 *On Christian Doctrine* (ca. 395 C.E.).
- 6 The study of how everyday language is used. Strictly speaking, this is a 20th-century movement started by the Austrian-born philosopher Ludwig Wittgenstein (1889-1941), though it is rooted in the work of the English empiricist John Locke (1632-1704).
- 7 That is, the scripturally based criticism inspired by D. W. Robertson Jr. (1914—92), a critic of medieval literature.

Text and System

John Frow

Along with Tony Bennett, John Frow is one of the most important contemporary Formalist theorists. In this selection from his book *Marxism and Literary History* (1986), he cunningly demonstrates how readers (and translators) make substantive changes in the meaning of a text over time. The same text from Homer's *The Iliad* is translated with great variability from one generation to another. Frow uses this evidence of interpretive variability to argue that texts are more like complicated assemblages of writing and interpretation within contexts than they are independent entities with firm boundaries.

Borges's "Pierre Menard, Author of *Don Quixote*" is a perfectly serious joke that we are still learning how to take seriously.¹ This story of an obscure provincial "novelist" who by an immense labor (the traces of which are lost) managed to produce a fragmentary text coinciding completely, at the verbal level, with several chapters of *Don Quixote* has usually been read as a meditation on the nature of reading and the nature of authorship. Macherey and Mike Gane both stress that Menard's enterprise "poses the question of reading in the most active possible manner: writing." Alicia Borinsky notes that it "puts into play the question of authorship as the production of voice and, in doing so... questions the kind of continuity that exists between that hypothetical voice and its discourse" (although she herself then restores the onto-logical link between author and text by reconstructing the voice of "Borges" as that of "the aristocracy of intelligence in Argentine political history").³ But in another sense the question of authorship is quite secondary. It is true that the narrator locates the difference between the two texts within a biographical framework; but his explanation of why it is that "the text of Cervantes and that of Menard are verbally identical, but the second is almost infinitely richer" (Borges, 49) is made in terms of the different systems of intertextuality within which the second is inscribed. Thus its disdainful avoidance of the Hispanicizing exoticism popularized by Merimee "indicates a new approach to the historical novel. This disdain condemns *Salammbô*, without appeal" (48). The apparent anachronism of the discourse on arms and letters is explained by reference to "the influence of Nietzsche" (48). And the address to "truth, whose mother is history," which in the seventeenth-century text is "a mere rhetorical eulogy of history," becomes in the twentieth-century text, written by "a contemporary of William James," a radical epistemological proposition (49).

The point is surely that, once we have disposed of the red herring of authorship, what is at stake is the historicity of a single, verbally self-identical text; what the parable suggests is that "textual 'identity' under changing conditions becomes 'difference.'" ⁴ The question I deliberately begged..., which dealt with "internally"

constructed intertextual structures, was that of those intertextual relations not constructed or controlled by the text. This is the question of the instability of the "internal," the fact that intrinsic structures are not given but are variably constructed in accordance with changing intertextual relations. Let me propose, schematically, that every text is marked by a multiple temporality: the time of its production (the "internal" time of its rewriting or repetition of prevailing literary and ideological norms), and the times of its reception (in which this textual process is transformed by its entry into new intertextual relationships). The serial or lateral movement of a text between systems produces new texts, and new kinds of text. Such a formulation should in principle preclude an ontological definition of literary function.... The value and function of texts should "be viewed differently according to the different places they occupied within the received cultures of different societies and different historical periods," and "literariness" would depend primarily "not on the formal properties of a text in themselves but on the position which those properties establish for the text within the matrices of the prevailing ideological field. Literariness resides, not in the text, but in the relations of intertextuality inscribed within and between texts." ...

It is not a question of denying the specific difference of literary texts from other language types but rather of constructing this difference as an object of historical understanding and of accounting for its effect in each case on the selection and semantic transformation of the literary corpus. And it is because the literariness of a text, its very existence *as* a "literary" text, is not an innate property that methodological priority must be given to the literary system or systems in which it is assigned its function. The mode of operation of a text cannot be pre-given by the structure of the genre since relations of signification, and hence the status of genre conventions themselves, are prescribed within a specific social articulation of discursive functions.

Thus the following texts⁶ are all realizations of the "same" genre conventions and even of the "same" initial production:

... so full of bloud, of dust, of darts, lay smit
 Divine Sarpedon that a man must have an excellent wit
 That could but know him; and might fail — so from his utmost head
 Even to the low plants of his feet his forme was altered.
 All thrusting neare it every way, as thick as flies in spring 5
 That in a sheepe-cote (when new milke assembles them) make wing
 And buzze about the top-full pailles. Nor ever was the eye
 Of Jove averted from the fight; he viewd, thought ceaselessly
 And diversly upon the death of great Achilles' friend —
 If Hector there (to wreake his sonne) should with his javelin end 10
 His life and force away his armes, or still augment the field.
 He then concluded that the flight of much more soule should yeeld
 Achilles' good friend more renowne, and that even to their gates
 He should drive Hector and his host; and so disanimates
 The mind of Hector that he mounts his chariot and takes Flight 15
 Up with him.

(Chapman, *Homer's Iliad*, Book 16)

Now great *Sarpedon*, on the sandy Shore, His
 heav'nly Form defac'd with Dust and Gore, And
 stuck with Darts by warring Heroes shed; Lies
 undistinguish'd from the vulgar dead.

His long-disputed Corpse the Chiefs inclose. 5
 On ev'ry side the busy Combate grows;
 Thick, as beneath some Shepherd's thatch'd Abode,
 The Pails high-foaming with a milky Flood,
 The buzzing Flies, a persevering Train,
 Incessant swarm, and chas'd, return again. 10
Jove view'd the Combate with a stern Survey, And
 Eyes that flash'd intolerable Day; Fix'd on the Field
 his Sight, his Breast debates The Vengeance due, and
 meditates the Fates;
 Whether to urge their prompt Effect, and call 15
 The Force of *Hector* to *Patroclus*' Fall, This Instant
 see his short-liv'd Trophies won, And stretch him
 breathless on his slaughter'd Son; Or yet, with many a
 Soul's untimely flight,
 Augment the Fame and Horror of the Fight? 20
 To crown *Achilles*'¹ valiant Friend with Praise At
 length he dooms; and that his last of Days Shall
 set in Glory; bids him drive the Foe; Nor
 unattended, see the Shades below.
 Then *Hector's* Mind he fills with dire dismay; 25
 He mounts his Car, and calls his Hosts away.
 (Pope, *The Iliad of Homer*, Book 16)

And now not even a clear-sighted man could any longer have known noble Sarpedon, for with darts and blood and dust was he covered wholly from head to foot. And ever men thronged about the dead, as in a steading flies buzz around the full milk-pails, in the season of spring when the milk drenches the bowls, even so thronged they about the dead. Nor ever did Zeus turn from the strong fight his shining eyes, but ever looked down on them, and much in his heart he debated of the slaying of Patroklos, whether there and then above divine Sarpedon glorious Hector should slay him likewise in strong battle with the sword, and strip his harness from his shoulders, or whether to more men yet he should deal sheer labour of war. And thus to him as he pondered it seemed the better way, that the gallant squire of Achilles, Peleus' son, should straightway drive the Trojans and Hector of the helm of bronze towards the city and should rob many of their life. And in Hector first he put a weakling heart, and leaping into his car Hector turned in flight.

(Lang, Leaf, and Myers, *Iliad*, Book 16)

No longer
 could a man, even a knowing one, have made out the godlike
 Sarpedon, since he was piled from head to ends of feet under
 a mass of weapons, the blood and the dust, while others about him
 kept forever swarming over his dead body, as flies

5
 through a sheepfold thunder about the pails overspilling milk, in the
 season of spring when the milk splashes in the buckets. So they swarmed
 over the dead man, nor did Zeus ever turn the glaring of his eyes from the
 strong encounter,
 but kept gazing forever upon them, in spirit reflective, 10
 and pondered hard over many ways for the death of Patroklos;
 whether this was now the time, in this strong encounter when there
 over godlike Sarpedon glorious Hektor

should kill him with the bronze, and strip the armour away from his shoulders,
 or whether to increase the steep work of fighting for more men. 15
 In the division of his heart this way seemed best to him,
 for the strong henchman of Achilleus, the son of Peleus,
 once again to push the Trojans and bronze-helmed Hektor
 back on their city, and tear the life from many. In Hektor
 first of all he put a temper that was without strength. 20
 He climbed to his chariot and turned to flight, and called to the other
 Trojans to run.

(Lattimore, *The Iliad of Homer*, Book 16)

And nobody, including those who saw him lie,
 A waxen god asleep on his outstretched hand,
 Could know him now.

But if you can imagine how
Each evening when the dairy pails come in 5
Innumerable flies throng around
The white ruff of the milk,
You will have some idea of how the Greeks and Trojans
Clouded about Sarpedon 's body.

And all this time God watched his favourite enemies: 10
 Considering. Minute Patroclus, a fleck Of spinning radium on
 his right hand -Should he die now? Or push the Trojans back
 still more? And on his left, Prince Hector, like a golden mote -
 Should he become a coward for an hour 15
 And run for Troy while Patroclus steals Sarpedon's gear That
 glistens like the sea at early morning?

The left goes down. In the half-light Hector's
 blood turned milky
 And he ran for Troy. 20

(Logue, *Patrocleia of Homer*)

To these I might have added Maginn's 1850 translation of passages of the *Odyssey* into an archaizing ballad form; Worsley's translation of the *Odyssey* into Spenserian stanzas (1861); Mackail's Pre-Raphaelite version of the *Odyssey* (1903); and Rouse's (1938) and Rieu's (1950) renditions of the Homeric epics as novels of action. But these few examples will suffice to demonstrate the ways in which the "same" text is a radically different piece of poetry in the context of different systems. The question of the relationship of these texts to an "original" text is not irrelevant, but this original is not the notional Homer of the eighth or ninth century B.C., not an author or a text situated at a fixed (and unreconstructable) point of origin; it is a sixteenth-or an eighteenth- or a twentieth-century "Homer," a particular mode of authority of the classical.

The texts demonstrate too the extent to which this mode of authority is fused with the major ideological categories of particular social formations; as this authority decays, the fusion becomes less intrinsic, and translation becomes an active recuperation of social content, until in the final text the diminished authority of the classical

allows it to be used in direct contradiction to other modes of social authority, including its own vestigial academic prestige.

Chapman's text is imbued with a metaphysical conception of human agency: this concern is realized through the use of key ambiguities ("plants," a lexeme which is now obsolete but which must, even in the early seventeenth century, have functioned as a latent organic pun; "forme," which is ambivalently a material and a spiritual concept; and "disanimates / The mind of Hector," in which the strong presence of the Latin root tends to override the literal sense and foreground the tension between human agency and divine intervention); through a syntax which depends heavily on the use of nontransactive verbs ("lay smit," "was altered"), which replaces the main verb of the second sentence with a present participle, and which elides the warriors in the indeterminate "all"; and through the allegorization of "Flight."

Pope's text works through a categorical framework which opposes and relates glory to death and then overlays this opposition with the dichotomized categories of social class: Sarpedon's "heav'nly Form" loses all rank and distinction to become one with the "vulgar dead." Patroclus, by contrast, balances the categories: "Trophies," "Fame," "Praise," and "Glory" are played against "short-liv'd," "Horror," and "his last of Days / Shall set"; this balancing means both the triumph of social hierarchy over death ("Nor unattended, see the Shades below") and yet also, in the dialectical perspective of a second reading, the opposite of this: death destroys social status, *and* social status survives death. This effect, or this *expectation*, of detached equivocality is achieved in part through the exploitation of syntactic ambiguity, especially in the use of participles ("high-foaming," "Fix'd") and causal sequencing ("To crown... he dooms," "and that... bids him"). "Thick" in line 7 refers both backward to "Combate" and forward to "Flies," and in this transition the individual warriors are subsumed within the two moments of the metaphor: the hypostatized action, which "grows" and is "busy," and the train of flies, a thoroughly Popean image of the disaffected mob. The vantage point here is that of Jove, an absolute monarch who is nevertheless subject to the ultimate constitutional check of the Fates.

The Lang, Leaf, and Myers translation is much less confident about its own social relevance; it is an ornamental text insofar as it uses Anglo-Saxon heroic models which certainly "translate" Homer but do so into categories which are dead. Zeus dealing "sheer labour of war," for example, is dubious because it is imitating an archaic concept of fate. Archaism both of vocabulary ("darts," "steading," "helm") and syntax ("was he covered," "even so thronged they") is the predominant stylistic feature, and its effect is to increase radically the redundancy of the text. In the extended simile there is a double stylistic tautology: "ever men thronged about the dead" / "even so thronged they about the dead"; "the full milk-pails, in the season of spring" / "when the milk drenches the bowls." The chiasmic geometry of the simile is autonomized and frozen by its lack of any function except self-reference. Surface elegance screens an underlying incoherence. Where the previous texts had drawn up a balance sheet of honor and death, here it simply "seemed" to Zeus "the better way." Similarly the nominalized form "the slaying of Patroklos" blurs considerations of tense and causality.

Lattimore's text relies much less on surface archaism, but it is equally academic and in fact it follows closely the syntax of Lang, Leaf, and Myers. In the extended simile, "steading" is replaced by "sheepfold," which is modern English; "bowls" by "buckets," which is comprehensible; and "buzz" by "thunder," which is stronger

but less appropriate. But the structure of chiasmic repetition remains unchanged. Lattimore's hexameter attempts a partial recuperation of an oral mode - through the use of feminine endings, spondaic feet ("more men," "steep work"), repetition ("forever ... ever... forever," "strong encounter"), and formulaic epithet ("the strong henchman of Achilles, the son of Peleus"); but these devices serve only to underline the distance between the two texts and the subordination of the later piece of writing to an alien text.

Logue's *Patrocleia*, by contrast, actively insists on its difference from this alien text, and uses anachronism as a way of identifying the authority of the classical with the ideologies of militarism and patriarchy. The text is a countertext, a deconstruction (but also an explication) of the social force of a literary norm. The fragmentation of epic homogeneity is achieved through a juxtaposition of lyrical discourse with politicized techniques of disruption. On the one hand lyrical cohesion is established through the binding together of chains of imagery which integrate the extended simile into its context: "clouded" not only refers to the mass of flies/warriors (this perspective is extended and defined in the wanton God's consideration of the "fleck" and "mote") but also picks up the opacity of "milk," which then goes forward to "Hector's blood turned milky," and perhaps also to the "half-light." Yet the simile is detached from its context, not only graphically but also by the stress on its rhetorical function ("if you can imagine how"). The play of perspectives, corresponding partly to the paragraphing, is of a novelistic complexity: line 1 particularizes point of view to participants in the action, and so subjectivizes the metaphor of the (syntactically ambiguous) second line. Line 4 reasserts narratorial objectivity. The third paragraph switches to the vantage point of a detached God, but also sets up a tension with the irony of "favourite enemies" and the intrusively figurative language of "spinning radium," "like a golden mote," and "that glistens like the sea at early morning." The lineation of the last paragraph then switches the perspective to that of a detached commentator undermining heroic rhetoric.

Five different Homers, then: five modes of collusion and conflict between social categories and an economy of literary conventions which works these categories and which also, especially in the later texts, works their refraction and their consolidation in previous literary economies. Translation makes the point neatly; but the same is true of a single linguistically constant text in its passage through time. *Don Quixote* is a component of every subsequent Spanish literary system, and to a lesser degree of most subsequent European systems, but it is a slightly different text in each case. This productive power of the literary system (the system is of course also partly produced by the tradition it incorporates) means that it cannot simply be defined empirically as a collection of texts. The system is rather a normative regime, a semantic code which governs the nature and the limits of literariness and the relations of signification which are socially possible and legitimate for the genres it recognizes. It produces new texts, and new texts from old texts, and new ways of reading and writing and framing texts; but since the invention of Literature some time in the eighteenth century, it has also produced the appearance of the universality and autonomy of the literary text.

Let me recall the three levels at which Tynjanov defines the concept of system. It refers in the first instance to the literary text as a hierarchically ordered structure of elements. But the text is constituted as such only in its intertextual relation to the codes of the literary system, and in particular in its integration to the subsystem of the codes of genre. At a third level the text and the literary system are defined, given a

determinate shape and function, through their relation to the "system of systems" -let us say their interdiscursive relation to other signifying formations and to the institutions and practices in which these are articulated. At each of these levels the concept of system works dynamically: time is a structural component of the system in the form of a play of actual or potential discontinuity between the levels of code and message.

I have suggested that the concept of literary system is equivalent to that of a discursive formation. But it should be clear that the mode of existence of the formation is not "merely" discursive, or rather that discourse is defined in such a way as to include its particular conditions of possibility: it constitutes a complex unity of semantic material, rhetorical modes, forms of subjectivity and agency, rules of availability, specific discursive practices, and specific institutional sites. All of these may overlap with the constituents of other discursive formations, and any formation will tend to be internally contradictory: the space of a discursive system is not unitary or homogeneous. What binds it together, more or less, is the normative authority it wields as an institution, an authority which is more or less strictly exercised and which is always the attempted imposition of a centralizing unity rather than the achieved fact of such a unity. Institutional authority, which by definition is asymmetrically distributed between "central" and "marginal" members of the institution, is deployed in particular to maintain the purity and the solidity of boundaries, and this involves both defining appropriate and inappropriate practices of language and restricting access to these practices to certified or qualified agents. The converse of this is the establishment of the "internal" categories of the institution as a particular range of possible functions. In the case of the literary system this means defining the functions of author, reader, and text and the possible relations between them; and delimiting the specificity of literary discourse, as though it were ontologically grounded. In terms of this normative regulation (and despite the diversity of the literary genres) the "literary" is reified as a distinct and unitary language game, and the logics of its forms (its genres, its rhetorical strategies and densities, its degrees of "keying") are coded as being appropriate to the institution.

Peter Burger has described in similar terms the conditions of constitution of the aesthetic:

Works of art are not received as single entities, but within institutional frameworks and conditions that largely determine the function of the works. When one refers to the function of an individual work, one generally speaks figuratively; for the consequences that one may observe and infer are not primarily a function of its special qualities but rather of the manner which regulates the commerce with works of this kind in a given society or in certain strata or classes of a society. I have chosen the term "institution of art" to characterize such framing conditions.

But rather than describing the full set of social practices and conditions which govern the commerce with and constitution of the work of art, Burger tends to equate the institution with a particular set of discourses about art (manifestos, for example) which, as aesthetic ideologies, are only a part of the total aesthetic apparatus. As a counterexample it might be worthwhile to consider briefly the systemic conditions of constitution of the Homeric texts.

Marthe Robert gives an incisive account, in *The Old and the New*, of their contradictory activations in antiquity. The primary function of the epics is pedagogic: they

are thought to incorporate a code of morality, a summary of wisdom, a compendium of the most varied forms of knowledge, and information about the smallest details of life. Even Plato, in the *Protagoras*, recommends that the teacher have his students learn by heart the "works of good poets" in which "they meet with many admonitions, many descriptions and praises and eulogies of good men in times past, that the boy in envy may imitate them and yearn to become even as they." In daily life the Homeric texts have almost the force of law. At the same time, however, this pedagogic authority is contested by the existence in antiquity of a tradition of logical and moral criticism of the texts. It is in order to close off this contradiction that the texts are reconstituted within a new institution of reading: that of allegorical exegesis. Here "Homer" is construed as the author of scientific, philosophical, mystical, or political treatises *disguised* as works of fiction. The distinction between the letter (the textual surface) and the inner meaning, corresponding to a further distinction between the ordinary (naïve) and the initiated reader, makes possible a sacralization of the texts which endows them with the highest conceivable spiritual authority (they are constituted as Scriptures) (83). This exegetical activity is the basis for a succession of later exegetical practices: the great Alexandrine commentaries, for example; the syntheses of neo-Platonism and Christianity in the allegorizing recuperations of Homer for the Renaissance; or the contemporary research of philologists, archaeologists, and anthropologists. One of the most important changes of direction was that brought about by the radical historicism of nineteenth-century philology. This new paradigm of reading constructed the Homeric epics as the manifestation of the spirit of a folk, which entailed redefining the author function in such a way that it could be filled by a group ("the people") rather than an individual. In addition, the Romantic revolution stressed the Aryan origins of the epic (which it read through the model of folklore) and established strict concordances between all the European epic cycles (86): hence the Victorian translators' use of Anglo-Saxon heroic models, and the dispute between Newman and Arnold as to whether the ballad form is the appropriate vehicle for capturing the primitive purity of the Greek epics. The dominant metaphor here is that of the "childhood of humanity," the organic historicism of which has plagued Marxist literary theory ever since Marx used the phrase (it is drawn directly from Hegel's *Asthetik*) in a famous passage of the *Grundrisse*.¹¹

Moral and exegetical pedagogy have been the most important supports of the different regimes of reading through which the Homeric texts have been variously constituted; but other institutional bases have at different times provided their conditions of possibility. One of the most recently excavated is that of the tradition of bardic recitation. As a result of the work of Milman Parry and Albert Lord (originally on twentieth-century Yugoslavian epic recitation), we now have a very different understanding both of the mode of composition (cumulative, formulaic, dependent on particular mnemonic trainings, and fusing the functions of author and performer) and of the conditions of enunciation of the Greek epic cycles (ritual recitations in an oral, preliterate culture, with a mix of functions including the repetition/commemoration of a stable world order, the filiation of the present with this past order, together with various profane informative functions).¹² A complementary account (for example Charles Autran, *Homere et les origines sacerdotales de l'épopée*, summarized in Robert, 89-91) stresses the cultic function of the epics and their close link with the caste of priests. The poems are written (composed) in a language which was *always* archaic and archaizing, an artificial composite of different dialects drawn from the

ritual language of the cults. In this perspective, the epics combine the functions of religious propaganda and legitimation of the nobility; they appear as "a collection of pious legends, designed to perpetuate the continuity of the great heroic families, which take pains to establish their divine ancestry" (91). Hence the structural importance of genealogies and nomenclatures, "which prove by continuity of lineage the theocratic origins of the aristocracy and royalty." In short: "Composed on command and according to absolutely fixed rules, the epic contains only the truth of the priestly caste on which it depended. This caste exploited the prestige and the influence of poetry, and expressed in turn its solidarity with a political and social system - the aristocracy - identified with the order of the world" (91).

But it must be stressed that this function of class legitimation is a recurrent function of the Homeric epics, not necessarily in terms of any inherent formal or thematic properties but purely and simply through their fetishized value as the Classic. Pope's translation appropriates their prestige for the culture of a restored aristocracy. At the height of the British Empire the classics continue to form the basis of the civil service entry examinations, and in both England and France constitute the major point of distinction between the "elaborated" and "restricted" training offered by the secondary and primary schooling systems. Rather than having a continuous value (or manifesting a "transcendence of historical conditions"), the Homeric epics are one of the means by which claims to cultural and hence political continuity are validated. Two contradictory moments of this process of constant retotalization and reintegration of the past into a qualitatively different present are, on the one hand, the cultural renaissances in which new class ideologies seek a legitimation and an expressive "mask" in material from a different period, and on the other hand, the ideological mechanisms of eternalization - the museum, the school text, the reference book, the television adaptation - which strip the "masterpieces" of their specific historical differences. It is the clarification of these mechanisms that becomes relevant, since, in Macherey's words: "Homer's *Iliad*, the 'work' of an 'author' exists only for us, and in relation to new material conditions into which it has been reinscribed and reinvested with a new significance: however odd it may seem, it did not exist for the Greeks and the problem of its conservation is thus not a relevant one. To go further: it is as if we ourselves had written it (or at least composed it anew)."

The forms of rewriting of the Homeric texts differ radically with the historically different forms of literary system in which they occur, but in all cases the rewriting is the result of a complex articulation of the literary system with other institutions (the school, religion), institutionalized practices (moral or religious training, commemoration, or else a relatively autonomous aesthetic function), and other discursive formations (religious, scientific, ethical). The ties between the literary system and its institutional bases may be close or they may be relatively loose, and the functions of the system are not necessarily homogeneous. But the system is always a network of norms and of processes and sites for the implementation (or contestation) of these norms.

What the literary system crucially governs are ways of reading, the interpretive grids through which texts are constituted. The concept of reading and of the reading subject has been the focus of intensive theorization in recent years, but it is also the site of an extraordinary lack of clarity. The status of "the reader" has been especially murky. The commonsense assumption that the reader is an empirical individual

quickly leads both to an atomistic relativism and to an inability to theorize the modes of textual inscription of reading. Conversely, a concentration on this inscription can hypostatize it as an immanent textual structure and so lead both to a disregard of the differences between the uses made of texts and to a disqualification of "deviant" readings. Empirical readers, inscribed readers, and ideal or informed or normal readers all have an uncanny ability to duplicate the readings preferred by the critic.

Similarly intensive theorization of reading has taken place in communication studies, where it assumes the more general (and perhaps more urgent) form of a debate about conflicting models of the communication process. David Morley gives a useful summary of two opposed traditions. On the one hand there is that of the Frankfurt School's account of the effects of "mass culture," in which manipulative signifying practices are seen as having a relatively ineluctable and unmediated impact; and with it that of the journal *Screen* (the unification is unfair but convenient), which describes the positioning of viewers such that they are shaped as unitary subjects in the apprehension of the imaginary unity of a discourse. On the other hand there is a tradition of research into the behavioral effects of the media or into the selective use of cultural messages ("uses and gratifications" analysis); in this tradition the emphasis is on the diversity of appropriations of texts. Morley himself attempts to reconstruct a heterogeneous range of readings of a single text across a number of social groups (ambivalently classified in terms of "subculture" or of "class") and so to explore the effects of the television text at the level of "the structuring of discourses and the provision of frameworks of interpretation and meaning."¹⁶ Part of the power of his analysis lies simply in the radical incompatibility of the twenty-eight reconstructed readings of the television program *Nationwide*. But the analysis is also theoretically provocative in its elaboration of Paul Willemen's argument for a lack of smooth fit between the subject position constructed for a viewer/reader in a particular text and the range of subject positions constructed in other discourses and practices. If analysis is expanded from the "abstract signifying mechanisms" of a text toward "the field of interdiscourse in which it is situated," then it becomes clear that the text produces no *necessary* effects, since the historical "subject" exceeds the subject positions of a text:

The "subject" exists only as the articulation of the multiplicity of particular subjectivities borne by an individual (as legal subject, familial subject, etc.), and it is the nature of this differential and contradictory positioning within the field of ideological discourse which provides the theoretical basis for the differential reading of texts and the existence of differential positions in respect to the position preferred by the text.¹⁹

Or more concisely, in Claire Johnston's words, "Real readers are subjects in history rather than mere subjects of a single text."²⁰ The problem with any such formulation, however, is that it tends easily to slip back into talk of a woracontradictory subject, a subject unified as "real," "historical," or (for Morley) "empirical."²¹ Any such realism of the subject then restores precisely that opposition of subject and object, reader and text, which, in its assumption of entities fully constituted prior to the textual process, is the major weakness of traditional theories of reading.

One of the most cogent cases against this polarity is that argued by Stanley Fish in the process of redefining his early commitment to a reader-centered aesthetic. This aesthetic had relied upon a strong demarcation between text and reader, conceived as

independently constituted entities; even the relatively greater emphasis he laid upon "the structure of the reader's experience" still left intact the text/reader dichotomy. (In any case this reader was only ever *derived* from the text: at times from some "objective" structure such as an interpretive crux, at times from the absence of such a structure, as when Fish postulates "a reading that is fleetingly available, although no one has acknowledged it because it is a function not of the words on the page but of the experience of the reader.") But, as Fish comes to argue, the problem with any such opposition of subject to object is that it takes for granted "the distinction between interpreters and the objects they interpret. That distinction in turn assumes that interpreters and their objects are two different kinds of ^contextual entities, and within these twin assumptions the issue can only be one of control: will texts be allowed to constrain their own interpretation or will irresponsible interpreters be allowed to obscure and overwhelm texts?" (336). The way out of this bind is to recognize that text and reader are categories given by particular interpretive strategies, and that the criteria of interpretation are therefore internal to discourse rather than given by the reality of texts or readers (238).

Once the interpretive process is understood in this conventionalist manner, a number of interesting consequences ensue. One is that it becomes necessary to dispense with an ontologically grounded differentiation between language varieties:

When we communicate, it is because we are parties to a set of discourse agreements which are in effect decisions as to what can be stipulated as a fact. It is these decisions and the agreement to abide by them, rather than the availability of substance, that makes it possible to refer, whether we are novelists or reporters for the *New York Times*. One might object that this has the consequence of making all discourse fictional; but it would be just as accurate to say that it makes all discourse serious, and it would be better still to say that it puts all discourse on a par. (242)

A second consequence is that language is seen always to be determinate in relation to a particular context; it is not limitlessly plural, but it is also not *inherently* determinate. And this means that there may be a plurality of determinate and stable meanings for a plurality of contexts. Underpinning this understanding of the constitutive status of discourse is the premise that linguistic and interpretive norms "are not embedded in the language (where they may be read out by anyone with sufficiently clear, that is, unbiased, eyes) but inhere in an institutional structure within which one hears utterances as already organized with reference to certain assumed purposes and goals" (306). Reading is thus relativized to the semiotic and situational constraints of a discursive formation, the institutional dimension of which Fish calls the "interpretive community." It is this dimension which makes possible agreement and disagreement - not as relations of truth and error but as a coincidence or conflict of interpretive frames.

Fish's attempt to theorize the institutional determinants of reading through the concept of the interpretive community is seriously flawed, however, by its inability to account in any sort of political terms for contradiction within or between communities and by its disregard of the relations of power which sustain communities. A complementary theorization of reading as a semiotic institution is that of Mircea Marghescou. Noting the plurality of possible valid readings of a text, Marghescou concludes that none of them therefore has a formal necessity. What they all have in common, however, is that they insert the signifier into a new semantic field in which

it tends to the realization of all its semantic possibilities. This functional constant is not an effect of the particular speech situation or of the formal structure of the message; nor is it the product of a subjective intention, because it is a shared semantic code which gives information about the operability of a text. Marghescou designates as the *regime* of a text this supralinguistic semantic code which assigns the message to its type and labels it with directions for use without specifying a particular content. In itself, he argues, the text is a purely virtual entity, and "only a regime designating the textual function through opposition to its linguistic function and above all to other possible semantic functions could give form to this virtuality, transform the linguistic form into information." Unlike the phenomenological concept of an "aesthetic attitude," the regime is conceived not as a fact of consciousness, nor even as an intersubjective consensus, but as a semiotic constraint.

These formulations make it possible to consider the interpretive process in systemic terms. The regime, the semiotic institution, determines the historically specific mode of existence of texts, as well as the point at which the line between the literary and the nonliterary is drawn. Further, the categories of text, author, and reader have the status not of entities but of variable *functions* they are products of determinate practices of reading, produced by, not given for, interpretation. These functions in turn mediate the textual transactions of real readers and writers, circumscribing both the actual operations each can perform and their representation of each other as textual functions. Writer and reader are not the fixed and isolated origin and conclusion of the textual process, nor is their relationship that of a constant factor to an uncontrolled variable (as is the case with Wolfgang Iser's oscillation between and, in practice, ultimate conflation of an "implied reader," understood as an *overt* - "intended" - textual function, and a real reader external to the textual process). Both "writer" and "reader" are the categories of a particular literary system and of particular regimes within it, and only as such are they amenable to theorization. But these categories are therefore unstable, and they shift in value as texts are translated from one literary system to another. Finally, interpretation, and a limited and definite range of contradictory interpretive strategies, are themselves constituted as determinate social practices within a specific historical regime. In short, the regime of reading is what allows readers to do work upon texts, to accept or transform readings offered as normative, to mesh reading with other social practices and other semiotic domains, and indeed to formulate and reformulate the categories of the regime itself.

From this theoretical basis it becomes possible to move to a meta-interpretive level where our concern is not with the Tightness or wrongness of a particular reading but with the formal and social conditions and preconditions of interpretation: that is, with an analysis of the politics of reading and the historicity of readings - the synchronic and diachronic heterogeneity of interpretation. This shift of level has been characteristic, I think, of much recent literary theory, under the double influence of structuralism's construction of its theoretical goal as a poetics rather than a practice of reading, and the demand made by reception theory that our own reading be relativized to the chain of prior interpretations. The move seems to me a positive one for two reasons: first, because of its generosity toward disparate readings, its insistence not on disqualifying invalid readings but on recognizing the politically and historically relative validity of different interpretations; and second, because it opens the way to an inscription of our own situation (political, methodological, historical) in the object of analysis as a component of that object _____

Such a shift of level entails paying particular attention to the institutions within which literary criticism adopts the form of a practice: that is, above all, to the educational apparatuses, which promote specific forms of circulation of writing and specific valorizations of certain kinds of writing, and which seek to impose a hegemonic "consensus" while making available certain possibilities of resistance. What is crucial here is that the literary system not be thought of as a monolithic unity. It is systematic only in the sense of providing a space of dispersion, but not in terms of any underlying epistemic coherence; certainly there is no necessary structural or functional homology between discursive formations.

Tony Bennett has used the concept of a reading formation to theorize the construction of text-reader relations within contradictory interpretive frames (and in particular to theorize "the necessary disparity which exists between the discourses of criticism and the reading formations, circulating outside the academy, through which popular reading is organized"). His argument is directed against that sleight of hand by which particular class-specific discourses of value elevate their criteria of judgment into universally normative principles which can be appealed to against the criteria of other, contradictory discourses of value. Bennett's interest is in the rim of social and institutional conditions governing interpretation, and in the political possibility of choice between one socioepistemological frame and another. But a possible consequence of this stress is that the details of any particular interpretation will be seen as relatively unimportant to the extent that they will be derivable from the hermeneutic protocols given as the preconditions of reading. The question of what happens within an interpretive frame once it is chosen or imposed is left open: it is a technical question, a question of application or realization.

Against any such objectification of the conditions of reading and valuation one must stress that aesthetic judgment is always a judgment about the determinate ideological force to be attached to an utterance in a particular historical conjuncture. Value and meaning can be read off neither from the "text itself nor from the rules of a reading formation, because the act of judgment involved is situational, political, and itself helps to construct "the text," the interpretive frame, and an overlapping but contradictory relation to competing interpretive positions. Clearly this varies historically: some frames are more rigid than others, and different kinds of text tend to demand more or less work of the reader. But in all cases the interpretive frame is not simply *prior* to particular readings, inexorably governing them, but is inferred, guessed at, constituted by a reading. Interpretive frames are fuzzy and continuously negotiable; and any account of the literary system needs to be accompanied by a continuous deconstruction of the concept of system.

Distinction

Pierre Bourdieu

In this selection from *Distinction* (1979), French sociologist Pierre Bourdieu argues that all taste in literature is an effect of prior determinants. One's class position, one's training in culture, one's education - all of these factors classify us as readers and sort us into groups who favor one kind of literature over another.

Classes and Classifications

If I have to choose the lesser of two evils, I choose neither.

Karl Kraus

Taste is an acquired disposition to 'differentiate' and 'appreciate',¹ as Kant says - in other words, to establish and mark differences by a process of distinction which is not (or not necessarily) a distinct knowledge, in Leibniz's sense, since it ensures recognition (in the ordinary sense) of the object without implying knowledge of the distinctive features which define it.² The schemes of the habitus, the primary forms of classification, owe their specific efficacy to the fact that they function below the level of consciousness and language, beyond the reach of introspective scrutiny or control by the will. Orienting practices practically, they embed what some would mistakenly call *values* in the most automatic gestures or the apparently most insignificant techniques of the body - ways of walking or blowing one's nose, ways of eating or talking - and engage the most fundamental principles of construction and evaluation of the social world, those which most directly express the division of labour (between the classes, the age groups and the sexes) or the division of the work of domination, in divisions between bodies and between relations to the body which borrow more features than one, as if to give them the appearances of naturalness, from the sexual division of labour and the division of sexual labour. Taste is a practical mastery of distributions which makes it possible to sense or intuit what is likely (or unlikely) to befall - and therefore to benefit - an individual occupying a given position in social space. It functions as a sort of social orientation, a 'sense of one's place', guiding the occupants of a given place in social space towards the social positions adjusted to their properties, and towards the practices or goods which benefit the occupants of that position. It implies a practical anticipation of what the social meaning and value of the chosen practice or thing will probably be, given their distribution in social space and the practical knowledge the other agents have of the correspondence between goods and groups.

Thus, the social agents whom the sociologist classifies are producers not only of classifiable acts but also of acts of classification which are themselves classified. Knowledge of the social world has to take into account a practical knowledge of this world which pre-exists it and which it must not fail to include in its object, although, as a first stage, this knowledge has to be constituted *against* the partial and interested representations provided by practical knowledge. To speak of habitus is to include in the object the knowledge which the agents, who are part of the object, have of the object, and the contribution this knowledge makes to the reality of the object. But it is not only a matter of putting back into the real world that one is endeavouring to know, a knowledge of the real world that contributes to its reality (and also to the force it exerts). It means conferring on this knowledge a genuinely constitutive power, the very power it is denied when, in the name of an objectivist conception of objectivity, one makes common knowledge or theoretical knowledge a mere reflection of the real world.

Those who suppose they are producing a materialist theory of knowledge when they make knowledge a passive recording and abandon the 'active aspect' of knowledge to idealism, as Marx complains in the *Theses on Feuerbach*, forget that all knowledge, and in particular all knowledge of the social world, is an act of construction implementing schemes of thought and expression, and that between conditions of existence and practices or representations there intervenes the structuring activity of the agents, who, far from reacting mechanically to mechanical stimulations, respond to the invitations or threats of a world whose meaning they have helped to produce. However, the principle of this structuring activity is not, as an intellectualist and anti-genetic idealism would have it, a system of universal forms and categories but a system of internalized, embodied schemes which, having been constituted in the course of collective history, are acquired in the course of individual history and function in their *practical* state, *for practice* (and not for the sake of pure knowledge).

Embodied Social Structures

This means, in the first place, that social science, in constructing the social world, takes note of the fact that agents are, in their ordinary practice, the subjects of acts of construction of the social world; but also that it aims, among other things, to describe the social genesis of the principles of construction and seeks the basis of these principles in the social world. Breaking with the anti-genetic prejudice which often accompanies recognition of the active aspect of knowledge, it seeks in the objective distributions of properties, especially material ones (brought to light by censuses and surveys which all presuppose selection and classification), the basis of the systems of classification which agents apply to every sort of thing, not least to the distributions themselves. In contrast to what is sometimes called the 'cognitive' approach, which, both in its ethnological form (structural anthropology, ethnosociology, ethnosemantics, ethnobotany etc.) and in its sociological form (interactionism, ethnomethodology etc.), ignores the question of the genesis of mental structures and classifications, social science enquires into the relationship between the principles of division and the social divisions (between the generations, the sexes etc.) on which they are based, and into the variations of the use made of these principles according to the position occupied in the distributions (questions which all require the use of statistics).

The cognitive structures which social agents implement in their practical knowledge of the social world are internalized, 'embodied' social structures. The practical knowledge of the social world that is presupposed by 'reasonable' behaviour within it implements classificatory schemes (or 'forms of classification', 'mental structures' or 'symbolic forms' - apart from their connotations, these expressions are virtually interchangeable), historical schemes of perception and appreciation which are the product of the objective division into classes (age groups, genders, social classes) and which function below the level of consciousness and discourse. Being the product of the incorporation of the fundamental structures of a society, these principles of division are common to all the agents of the society and make possible the production of a common, meaningful world, a common-sense world.

All the agents in a given social formation share a set of basic perceptual schemes, which receive the beginnings of objectification in the pairs of antagonistic adjectives commonly used to classify and qualify persons or objects in the most varied areas of practice. The network of oppositions between high (sublime, elevated, pure) and low (vulgar, low, modest), spiritual and material, fine (refined, elegant) and coarse (heavy, fat, crude, brutal), light (subtle, lively, sharp, adroit) and heavy (slow, thick, blunt, laborious, clumsy), free and forced, broad and narrow, or, in another dimension, between unique (rare, different, distinguished, exclusive, exceptional, singular, novel) and common (ordinary, banal, commonplace, trivial, routine), brilliant (intelligent) and dull (obscure, grey, mediocre), is the matrix of all the commonplaces which find such ready acceptance because behind them lies the whole social order. The network has its ultimate source in the opposition between the 'elite' of the dominant and the 'mass' of the dominated, a contingent, disorganized multiplicity, interchangeable and innumerable, existing only statistically. These mythic roots only have to be allowed to take their course in order to generate, at will, one or another of the tirelessly repeated themes of the eternal sociodicy, such as apocalyptic denunciations of all forms of 'levelling', 'trivialization' or 'massification', which identify the decline of societies with the decadence of bourgeois houses, i.e., a fall into the homogeneous, the undifferentiated, and betray an obsessive fear of number, of undifferentiated hordes indifferent to difference and constantly threatening to submerge the private spaces of bourgeois exclusiveness.

The seemingly most formal oppositions within this social mythology always derive their ideological strength from the fact that they refer back, more or less discreetly, to the most fundamental oppositions within the social order: the opposition between the dominant and the dominated, which is inscribed in the division of labour, and the opposition, rooted in the division of the labour of domination, between two principles of domination, two powers, dominant and dominated, temporal and spiritual, material and intellectual etc. It follows that the map of social space previously put forward can also be read as a strict table of the historically constituted and acquired categories which organize the idea of the social world in the minds of all the subjects belonging to that world and shaped by it. The same classificatory schemes (and the oppositions in which they are expressed) can function, by being specified, in fields organized around polar positions, whether in the field of the dominant class, organized around an opposition homologous to the opposition constituting the field of the social classes, or in the field of cultural production, which is itself organized around oppositions which reproduce the structure of the dominant class and are homologous to it (e.g., the opposition between bourgeois and

avant-garde theatre). So the fundamental opposition constantly supports second, third or n^{th} rank oppositions (those which underlie the 'purest' ethical or aesthetic judgements, with their high or low sentiments, their facile or difficult notions of beauty, their light or heavy styles etc.), while euphemizing itself to the point of misrecognizability.

Thus, the opposition between the heavy and the light, which, in a number of its uses, especially scholastic ones, serves to distinguish popular or petit-bourgeois tastes from bourgeois tastes, can be used by theatre criticism aimed at the dominant fraction of the dominant class to express the relationship between 'intellectual' theatre, which is condemned for its 'laborious' pretensions and 'oppressive' didacticism, and 'bourgeois' theatre, which is praised for its tact and its art of skimming over surfaces. By contrast, 'intellectual' criticism, by a simple inversion of values, expresses the relationship in a scarcely modified form of the same opposition, with lightness, identified with frivolity, being opposed to profundity. Similarly, it can be shown that the opposition between right and left, which, in its basic form, concerns the relationship between the dominant and the dominated, can also, by means of a first transformation, designate the relations between dominated fractions and dominant fractions within the dominant class; the words right and left then take on a meaning close to the meaning they have in expressions like 'right-bank' theatre or 'left-bank' theatre. With a further degree of 'de-realization', it can even serve to distinguish two rival tendencies within an avant-garde artistic or literary group, and so on.

It follows that, when considered in each of their uses, the pairs of qualifiers, the system of which constitutes the conceptual equipment of the judgement of taste, are extremely poor, almost indefinite, but, precisely for this reason, capable of eliciting or expressing the sense of the indefinable. Each particular use of one of these pairs only takes on its full meaning in relation to a universe of discourse that is different each time and usually implicit - since it is a question of the system of self-evidences and presuppositions that are taken for granted in the field in relation to which the speakers' strategies are defined. But each of the couples specified by usage has for undertones all the other uses it might have - because of the homologies between the fields which allow transfers from one field to another - and also all the other couples which are interchangeable with it, within a nuance or two (e.g., *fine*/crude for light/ heavy), that is, in slightly different contexts.

The fact that the semi-codified oppositions contained in ordinary language reappear, with very similar values, as the basis of the dominant vision of the social world, in all class-divided social formations (consider the tendency to see the 'people' as the site of totally uncontrolled appetites and sexuality) can be understood once one knows that, reduced to their formal structure, the same fundamental relationships, precisely those which express the major relations of order (high/low, strong/weak etc.) reappear in all class-divided societies. And the recurrence of the triadic structure studied by Georges Dumézil, which Georges Duby shows in the case of feudal society to be rooted in the social structures it legitimates, may well be, like the invariant oppositions in which the relationship of domination is expressed, simply a necessary outcome of the intersection of the two principles of division which are at work in all class-divided societies - the division between the dominant and the dominated, and the division between the different fractions competing for dominance in the name of different principles, *bellatores* (warriors) and *oratores* (scholars) in feudal society, businessmen and intellectuals now.⁵

Knowledge without Concepts

Thus, through the differentiated and differentiating conditionings associated with the different conditions of existence, through the exclusions and inclusions, unions (marriages, affairs, alliances etc.) and divisions (incompatibilities, separations, struggles etc.) which govern the social structure and the structuring force it exerts, through all the hierarchies and classifications inscribed in objects (especially cultural products), in institutions (for example, the educational system) or simply in language, and through all the judgements, verdicts, gradings and warnings imposed by the institutions specially designed for this purpose, such as the family or the educational system, or constantly arising from the meetings and interactions of everyday life, the social order is progressively inscribed in people's minds. Social divisions become principles of division, organizing the image of the social world. Objective limits become a sense of limits, a practical anticipation of objective limits acquired by experience of objective limits, a 'sense of one's place' which leads one to exclude oneself from the goods, persons, places and so forth from which one is excluded.

The *sense* of limits implies *forgetting* the limits. One of the most important effects of the correspondence between real divisions and practical principles of division, between social structures and mental structures, is undoubtedly the fact that primary experience of the social world is that of *doxa*, an adherence to relations of order which, because they structure inseparably both the real world and the thought world, are accepted as self-evident. Primary perception of the social world, far from being a simple mechanical reflection, is always an act of cognition involving principles of construction that are external to the constructed object grasped in its immediacy; but at the same time it is an act of *miscognition*, implying the most absolute form of recognition of the social order. Dominated agents, who assess the value of their position and their characteristics by applying a system of schemes of perception and appreciation which is the embodiment of the objective laws whereby their value is objectively constituted, tend to attribute to themselves what the distribution attributes to them, refusing what they are refused ('That's not for the likes of us'), adjusting their expectations to their chances, defining themselves as the established order defines them, reproducing in their verdict on themselves the verdict the economy pronounces on them, in a word, condemning themselves to what is in any case their lot, *ta beautou*, as Plato put it, consenting to be what they have to be, 'modest', 'humble' and 'obscure'. Thus the conservation of the social order is decisively reinforced by what Durkheim called 'logical conformity', i.e., the orchestration of categories of perception of the social world, which, being adjusted to the divisions of the established order (and thereby to the interests of those who dominate it) and common to all minds structured in accordance with those structures, present every appearance of objective necessity.⁷

The system of classificatory schemes is opposed to a taxonomy based on explicit and explicitly concerted principles in the same way that the dispositions constituting taste or ethos (which are dimensions of it) are opposed to aesthetics or ethics. The sense of social realities that is acquired in the confrontation with a particular form of social necessity is what makes it possible to act *as if* one knew the structure of the social world, one's place within it and the distances that need to be kept.

The ideology of the Utopian thinker, rootless and unattached, 'free-floating', without interests or profits, together with the correlative refusal of that supreme form of materialistic vulgarity, the reduction of the unique to the class, the explanation of the higher by the lower, the application to the would-be unclassifiable of explanatory models fit only for the 'bourgeois', the petit-bourgeois, the limited and common, scarcely inclines intellectuals to conceptualize the sense of social position, still less their own position and the perverse relation to the social world it forces on them. (The perfect example is Sartre, whose whole work and whole existence revolve around this affirmation of the intellectual's subversive point of honour. This is seen particularly clearly in the passage in *Being and Nothingness* on the psychology of Flaubert, which can be read as a desperate effort to save the person, in the person of the intellectual, an uncreated creator, begotten by his own works, haunted by 'the project of being God', from every sort of reduction to the general, the type, the class, and to affirm the transcendence of the ego against 'what Comte called *materialism*, that is, explaining the higher by the lower.')

The practical mastery of classification has nothing in common with the reflexive mastery that is required in order to construct a taxonomy that is simultaneously coherent and adequate to social reality. The practical 'science' of positions in social space is the competence presupposed by the art of behaving *comme il faut* with persons and things that have and give 'class' ('smart' or 'unsmart'), finding the right distance, by a sort of practical calculation, neither too close ('getting familiar') nor too far ('being distant'), playing with objective distance by emphasizing it (being 'aloof', 'stand-offish') or symbolically denying it (being 'approachable', 'hobnobbing'). It in no way implies the capacity to situate oneself explicitly in the classification (as so many surveys on social class ask people to do), still less to describe this classification in any systematic way and state its principles.

There is no better opportunity to observe the functioning of this sense of the place one occupies than in condescension strategies, which presuppose both in the author of the strategy and in the victims a practical knowledge of the gap between the place really occupied and the place fictitiously indicated by the behaviour adopted (e.g., in French, use of the familiar *tu*). When the person 'naturally' identified with a Rolls Royce, a top hat or golf (see appendix 4) takes the metro, sports a flat cap (or a polo neck) or plays football, his practices take on their meaning in relation to this attribution by status, which continues to colour the real practices, as if by superimposition. But one could also point to the variations that Charles Bally observed in the style of speech according to the social gap between the interlocutors, or the variations in pronunciation according to the addressee: the speaker may, as appropriate, move closer to the 'accent' of an addressee of (presumed) higher status or move away from it by 'accentuating' his ordinary accent.

The practical 'attributive judgement' whereby one puts someone in a class by speaking to him in a certain way (thereby putting oneself in a class at the same time) has nothing to do with an intellectual operation implying conscious reference to explicit indices and the implementation of classes produced by and for the concept. The same classificatory opposition (rich/poor, young/old etc.) can be applied at any point in the distribution and reproduce its whole range within any of its segments

(common sense tells us that one is always richer or poorer than someone, superior or inferior to someone, more right-wing or left-wing than someone - but this does not entail an elementary relativism).

In a series of interviews (n = 30) on the social classes, based on a test which involved classifying thirty occupations (written on cards), the respondents often first asked how many classes the set should be divided into, and then several times modified the number of classes and the criteria of classification, so as to take account of the different dimensions of each occupation and therefore the different respects in which it could be evaluated; or they spontaneously suggested that they could carry on sub-dividing indefinitely. (They thereby exposed the artificiality of the situation created by a theoretical inquiry which called for the adoption of a theoretical attitude to which, as their initial uncertainty indicated, the respondents were quite unaccustomed.) And yet they almost always agreed on the ranks of the different occupations when taken two by two. (Lenski made similar observations in an experiment in which the respondents were asked to rank the families in a small town in New England.)¹⁰

It is not surprising that it is possible to fault the practical sense of social space which lies behind class-attributive judgement; the sociologists who use their respondents' self-contradictions as an argument for denying the existence of classes simply reveal that they understand nothing of how this 'sense' works or of the artificial situation in which they are making it work. In fact, whether it is used to situate oneself in social space or to place others, the sense of social space, like every practical sense, always refers to the particular situation in which it has to orient practices. This explains, for example, the divergences between surveys of the representation of the classes in a small town ('community studies') and surveys of class on a nationwide scale. But if, as has often been observed, respondents do not agree either on the number of divisions they make within the group in question, or on the limits of the 'strata' and the criteria used to define them, this is not simply due to the fuzziness inherent in all practical logics. It is also because people's image of the classification is a function of their position within it.

So nothing is further removed from an act of cognition, as conceived by the intellectualist tradition, than this sense of the social structure, which, as is so well put by the word *taste* - simultaneously 'the faculty of perceiving flavours' and 'the capacity to discern aesthetic values' - is social necessity made second nature, turned into muscular patterns and bodily automatisms. Everything takes place as if the social conditionings linked to a social condition tended to inscribe the relation to the social world in a lasting, generalized relation to one's own body, a way of bearing one's body, presenting it to others, moving it, making space for it, which gives the body its social physiognomy. Bodily hexis, a basic dimension of the sense of social orientation, is a practical way of experiencing and expressing one's own sense of social value. One's relationship to the social world and to one's proper place in it is never more clearly expressed than in the space and time one feels entitled to take from others; more precisely, in the space one claims with one's body in physical space, through a bearing and gestures that are self-assured or reserved, expansive or constricted ('presence' or 'insignificance') and with one's speech in time, through the interaction time one appropriates and the self-assured or aggressive, careless or unconscious way one appropriates it.¹²

There is no better image of the logic of socialization, which treats the body as a 'memory-jogger', than those complexes of gestures, postures and words — simple interjections or favourite clichés - which only have to be slipped into, like a theatrical costume, to awaken, by the evocative power of bodily mimesis, a universe of ready-made feelings and experiences. The elementary actions of bodily gymnastics, especially the specifically sexual, biologically pre-constructed aspect of it, charged with social meanings and values, function as the most basic of metaphors, capable of evoking a whole relationship to the world, 'lofty' or 'submissive', 'expansive' or 'narrow', and through it a whole world. The practical 'choices' of the sense of social orientation no more presuppose a representation of the range of possibilities than does the choice of phonemes; these enacted choices imply no acts of choosing. The logocentrism and intellectualism of intellectuals, combined with the prejudice inherent in the science which takes as its object the psyche, the soul, the mind, consciousness, representations, not to mention the petit-bourgeois pretension to the status of 'person', have prevented us from seeing that, as Leibniz put it, 'we are automatons in three-quarters of what we do', and that the ultimate values, as they are called, are never anything other than the primary, primitive dispositions of the body, 'visceral' tastes and distastes, in which the group's most vital interests are embedded, the things on which one is prepared to stake one's own and other people's bodies. The sense of distinction, the *discretio* (discrimination) which demands that certain things be brought together and others kept apart, which excludes all misalliances and all unnatural unions - i.e., all unions contrary to the common classification, to the *diacrisis* (separation) which is the basis of collective and individual identity - responds with visceral, murderous horror, absolute disgust, metaphysical fury, to everything which lies in Plato's 'hybrid zone', everything which passes understanding, that is, the embodied taxonomy, which, by challenging the principles of the incarnate social order, especially the socially constituted principles of the sexual division of labour and the division of sexual labour, violates the mental order, scandalously flouting common sense.

It can be shown that socialization tends to constitute the body as an analogical operator establishing all sorts of practical equivalences between the different divisions of the social world - divisions between the sexes, between the age groups and between the social classes - or, more precisely, between the meanings and values associated with the individuals occupying practically equivalent positions in the spaces defined by these divisions. And it can be shown that it does so by integrating the symbolism of social domination and submission and the symbolism of sexual domination and submission into the same body language - as is seen in etiquette, which uses the opposition between the straight and the curved or, which amounts to the same thing, between raising (oneself) and lowering (oneself), as one of the generative principles of the marks (of respect, contempt etc.) used to symbolize hierarchical relations.

Advantageous Attributions

The basis of the pertinence principle which is implemented in perceiving the social world and which defines all the characteristics of persons or things which can be perceived, and perceived as positively or negatively interesting, by all those who

apply these schemes (another definition of common sense), is based on nothing other than the interest the individuals or groups in question have in recognizing a feature and in identifying the individual in question as a member of the set defined by that feature; interest in the aspect observed is never completely independent of the advantage of observing it. This can be clearly seen in all the classifications built around a stigmatized feature which, like the everyday opposition between homosexuals and heterosexuals, isolate the interesting trait from all the rest (i.e., all other forms of sexuality), which remain indifferent and undifferentiated. It is even clearer in all 'labelling judgements', which are in fact accusations, *categoremes* in the original Aristotelian sense, and which, like insults, only wish to know one of the properties constituting the social identity of an individual or group ('You're just a...'), regarding, for example, the married homosexual or converted Jew as a 'closet queen' or covert Jew, and thereby in a sense doubly Jewish or homosexual. The logic of the stigma reminds us that social identity is the stake in a struggle in which the stigmatized individual or group, and, more generally, any individual or group insofar as he or it is a potential object of categorization, can only retaliate against the partial perception which limits it to one of its characteristics by highlighting, in its self-definition, the best of its characteristics, and, more generally, by struggling to impose the taxonomy most favourable to its characteristics, or at least to give to the dominant taxonomy the content most flattering to what it has and what it is.

Those who are surprised by the paradoxes that ordinary logic and language engender when they apply their divisions to continuous magnitudes forget the paradoxes inherent in treating language as a purely logical instrument and also forget the social situation in which such a relationship to language is possible. The contradictions or paradoxes to which ordinary language classifications lead do not derive, as all forms of positivism suppose, from some essential inadequacy of ordinary language, but from the fact that these socio-logical acts are not directed towards the pursuit of logical coherence and that, unlike philological, logical or linguistic uses of language - which ought really to be called scholastic, since they all presuppose *scholē*, i.e., leisure, distance from urgency and necessity, the absence of vital stakes, and the scholastic institution which in most social universes is the only institution capable of providing all these - they obey the logic of the *parti pris*, which, as in a court-room, juxtaposes not logical judgements, subject to the sole criterion of coherence, but charges and defences. Quite apart from all that is implied in the oppositions, which logicians and even linguists manage to forget, between the art of convincing and the art of persuading, it is clear that scholastic usage of language is to the orator's, advocate's or politician's usage what the classificatory systems devised by the logician or statistician concerned with coherence and empirical adequacy are to the categorizations and *categoremes* of daily life. As the etymology suggests, the latter belong to the logic of the trial.¹³ Every real inquiry into the divisions of the social world has to analyse the interests associated with membership or non-membership. As is shown by the attention devoted to strategic, 'frontier' groups such as the 'labour aristocracy', which hesitates between class struggle and class collaboration, or the 'cadres', a category of bureaucratic statistics, whose nominal, doubly negative unity conceals its real dispersion both from the 'interested parties' and from their opponents and most observers, the laying down of boundaries between the classes is inspired by the strategic aim of 'counting in' or 'being counted in', 'cataloguing' or 'annexing', when it is not the simple recording of a legally guaranteed state of the power relation between the classified groups.

Leaving aside all cases in which the statutory imposition of an arbitrary boundary (such as a 30-kilo limit on baggage or the rule that a vehicle over two tons is a van) suffices to eliminate the difficulties that arise from the sophism of the heap of grain, boundaries - even the most formal-looking ones, such as those between age-groups - do indeed freeze a particular state of social struggles, i.e., a given state of the distribution of advantages and obligations, such as the right to pensions or cheap fares, compulsory schooling or military service. And if we are amused by Alphonse Allais's story of the father who pulls the communication cord to stop the train at the very moment his child becomes three years old (and so needs a ticket to travel), it is because we immediately see the sociological absurdity of an imaginary variation which is as impeccably logical as those on which logicians base their beloved paradoxes. Here the limits are frontiers to be attacked or defended with all one's strength, and the classificatory systems which fix them are not so much means of knowledge as means of power, harnessed to social functions and overtly or covertly aimed at satisfying the interests of a group.

A number of ethical, aesthetic, psychiatric or forensic classifications that are produced by the 'institutional sciences', not to mention those produced and inculcated by the educational system, are similarly subordinated to social functions, although they derive their specific efficacy from their apparent neutrality. They are produced in accordance with the specific logic, and in the specific language, of relatively autonomous fields, and they combine a real dependence on the classificatory schemes of the dominant habitus (and ultimately on the social structures of which these are the product) with an apparent independence. The latter enables them to help to legitimate a particular state of the classification struggle and the class struggle. Perhaps the most typical example of these semi-autonomous systems of classification is the system of adjectives which underpins scholastic 'appreciations'.

Commonplaces and classificatory systems are thus the stake of struggles between the groups they characterize and counterpose, who fight over them while striving to turn them to their own advantage. Georges Duby shows how the model of the three orders, which fixed a state of the social structure and aimed to make it permanent by codifying it, was able to be used simultaneously and successively by antagonistic groups: first by the bishops, who had devised it, against the heretics, the monks and the knights; then by the aristocracy, against the bishops and the king; and finally by the king, who, by setting himself up as the absolute subject of the classifying operation, as a principle external and superior to the classes it generated (unlike the three orders, who were subjects but also objects, judges but also parties), assigned each group its place in the social order, and established himself as an unassailable vantage-point. In the same way it can be shown that the schemes and commonplaces which provide images of the different forms of domination, the opposition between the sexes and age-groups as well as the opposition between the generations, are similarly manipulated. The 'young' can accept the definition that their elders offer them, take advantage of the temporary licence they are allowed in many societies ('Youth must have its fling'), do what is assigned to them, revel in the 'specific virtues' of youth, *virtu*, virility, enthusiasm, and get on with their own business - knight-errantry for the scions of the mediaeval aristocracy, ⁷ love and violence for the youth of Renaissance Florence, and every form of regulated, ludic wildness (sport, rock etc.) for

contemporary adolescents - in short, allow themselves to be kept in the state of 'youth', that is, irresponsibility, enjoying the freedom of irresponsible behaviour in return for renouncing responsibility. In situations of specific crisis, when the order of successions is threatened, 'young people', refusing to remain consigned to 'youth', tend to consign the 'old' to 'old age'. Wanting to take the responsibilities which define adults (in the sense of socially complete persons), they must push the holders of responsibilities into that form of irresponsibility which defines old age, or rather retirement. The wisdom and prudence claimed by the elders then collapse into conservatism, archaism or, quite simply, senile irresponsibility. The newcomers, who are likely to be also the biologically youngest, but who bring with them many other distinctive properties, stemming from changes in the social conditions of production of the producers (i.e., principally the family and the educational system), escape the more rapidly from 'youth' (irresponsibility) the readier they are to break with the irresponsible behaviour assigned to them and, freeing themselves from the internalized limits (those which may make a 50-year-old feel 'too young reasonably to aspire' to a position or an honour), do not hesitate to push forward, 'leap-frog' and 'take the escalator' to precipitate their predecessors' fall into the past, the outdated, in short, social death. But they have no chance of winning the struggles over the limits which break out between the age-groups when the sense of the limits is lost, unless they manage to impose a new definition of the socially complete person, including in it characteristics normally (i.e., in terms of the prevailing classificatory principle) associated with youth (enthusiasm, energy and so on) or characteristics that can supplant the virtues normally associated with adulthood.

In short, what individuals and groups invest in the particular meaning they give to common classificatory systems by the use they make of them is infinitely more than their 'interest' in the usual sense of the term; it is their whole social being, everything which defines their own idea of themselves, the primordial, tacit contract whereby they define 'us' as opposed to 'them', 'other people', and which is the basis of the exclusions ('not for the likes of us') and inclusions they perform among the characteristics produced by the common classificatory system.

Social psychologists have observed that any division of a population into two groups, however arbitrary, induces discriminatory behaviour favourable to members of the agents' own group and hostile to members of the other group, even if it has adverse effects for the former group.¹⁹ More generally, they describe under the term 'category differentiation' the operations whereby agents construct their perception of reality, in particular the process of accentuating differences vis-a-vis 'outsiders' (dissimilation) and reinforcing similarities with insiders (assimilation).²⁰ Similarly, studies of racism have shown that whenever different groups are juxtaposed, a definition of the approved, valorized behaviour tends to be contrasted with the despised, rejected behaviour of the other group. Social identity lies in difference, and difference is asserted against what is closest, which represents the greatest threat. Analysis of stereotyping, the propensity to assume a correspondence between membership of a category (e.g., Nordic or Mediterranean, Western or Oriental) and possession of a particular property, so that knowledge of a person's category strongly influences judgements of him, is in line with analysis of that sort of social stereotyping in which all the members of a social formation tend to concur in attributing certain properties to members of the different social classes.

The fact that, in their relationship to the dominant classes, the dominated classes attribute to themselves strength in the sense of labour power and fighting strength - physical strength and also strength of character, courage, manliness - does not prevent the dominant groups from similarly conceiving the relationship in terms of the scheme strong/weak; but they reduce the strength which the dominated (or the young, or women) ascribe to themselves to brute strength, passion and instinct, a blind, unpredictable force of nature, the unreasoning violence of desire, and they attribute to themselves spiritual and intellectual strength, a self-control that predisposes them to control others, a strength of soul or spirit which allows them to conceive their relationship to the dominated - the 'masses', women, the young - as that of the soul to the body, understanding to sensibility, culture to nature.

The Classification Struggle

Principles of division, inextricably logical and sociological, function within and for the purposes of the struggle between social groups; in producing concepts, they produce groups, the very groups which produce the principles and the groups against which they are produced. What is at stake in the struggles about the meaning of the social world is power over the classificatory schemes and systems which are the basis of the representations of the groups and therefore of their mobilization and demobilization: the evocative power of an utterance which puts things in a different light (as happens, for example, when a single word, such as 'paternalism', changes the whole experience of a social relationship) or which modifies the schemes of perception, shows something else, other properties, previously unnoticed or relegated to the background (such as common interests hitherto masked by ethnic or national differences); a separative power, a distinction, *diacrisis*, *discretion* drawing discrete units out of indivisible continuity, difference out of the undifferentiated.

Only in and through the struggle do the internalized limits become boundaries, barriers that have to be moved. And indeed, the system of classificatory schemes is constituted as an objectified, institutionalized system of classification only when it has ceased to function as a sense of limits so that the guardians of the established order must enunciate, systematize and codify the principles of production of that order, both real and represented, so as to defend them against heresy; in short, they must constitute the *doxa* as orthodoxy. Official systems of classification, such as the theory of the three orders, do explicitly and systematically what the classificatory schemes did tacitly and practically. Attributes, in the sense of predicates, thereby become *attributions*, powers, capacities, privileges, prerogatives, attributed to the holder of a post, so that war is no longer what the warrior does, but the *officium*, the specific function, the *raison d'être*, of the *bellator*. Classificatory *discretio*, like law, freezes a certain state of the power relations which it aims to fix forever by enunciating and codifying it. The classificatory system as a principle of logical and political division only exists and functions because it reproduces, in a transfigured form, in the symbolic logic of differential gaps, i.e., of discontinuity, the generally gradual and continuous differences which structure the established order; but it makes its own, that is, specifically symbolic, contribution to the maintenance of that order only because it has the specifically symbolic power to make people see and believe which is given by the imposition of mental structures.

Systems of classification would not be such a decisive object of struggle if they did not contribute to the existence of classes by enhancing the efficacy of the objective mechanisms with the reinforcement supplied by representations structured in accordance with the classification. The imposition of a recognized name is an act of recognition of full social existence which transmutes the thing named. It no longer exists merely *de facto*, as a tolerated, illegal or illegitimate practice, but becomes a *social* function, i.e., a mandate, a mission (*Beruf*), a task, a role - all words which express the difference between authorized activity, which is assigned to an individual or group by tacit or explicit delegation, and mere usurpation, which creates a 'state of affairs' awaiting institutionalization. But the specific effect of 'collective representations', which, contrary to what the Durkheimian connotations might suggest, may be the product of the application of the same scheme of perception or a common system of classification while still being subject to antagonistic social uses, is most clearly seen when the word precedes the thing, as with voluntary associations that turn into recognized professions or corporate defence groups (such as the trade union of the 'cadres'), which progressively impose the representation of their existence and their unity, both on their own members and on other groups.

A group's presence or absence in the official classification depends on its capacity to get itself recognized, to get itself noticed and admitted, and so to win a place in the social order. It thus escapes from the shadowy existence of the 'nameless crafts' of which Emile Benveniste speaks: business in antiquity and the Middle Ages, or illegitimate activities, such as those of the modern healer (formerly called an 'empiric'), bone-setter or prostitute. The fate of groups is bound up with the words that designate them: the power to impose recognition depends on the capacity to mobilize around a name, 'proletariat', 'working class', 'cadres' etc., to appropriate a common name and to commune in a proper name, and so to mobilize the union that makes them strong, around the unifying power of a word.

In fact, the order of words never exactly reproduces the order of things. It is the relative independence of the structure of the system of classifying, classified words (within which the distinct value of each particular label is defined) in relation to the structure of the distribution of capital, and more precisely, it is the time-lag (partly resulting from the inertia inherent in classification systems as quasi-legal institutions sanctioning a state of a power relation) between changes in jobs, linked to changes in the productive apparatus, and changes in titles, which creates the space for symbolic strategies aimed at exploiting the discrepancies between the nominal and the real, appropriating words so as to get the things they designate, or appropriating things while waiting to get the words that sanction them; exercising responsibilities without having entitlement to do so, in order to acquire the right to claim the legitimate titles, or, conversely, declining the material advantages associated with devalued titles so as to avoid losing the symbolic advantages bestowed by more prestigious labels or, at least, vaguer and more manipulable ones; donning the most flattering of the available insignia, verging on imposture if need be - like the potters who call themselves 'art craftsmen', or technicians who claim to be engineers - or inventing new labels, like physiotherapists (*kinesitherapeutes*) who count on this new title to separate them from mere masseurs and bring them closer to doctors. All these strategies, like all processes of competition, a paper-chase aimed at ensuring constant distinctive gaps, tend to produce a steady inflation of titles - restrained by the inertia of the institutionalized taxonomies (collective agreements, salary scales etc.) - to which legal guarantees are

attached. The negotiations between antagonistic interest groups, which arise from the establishment of collective agreements and which concern, inseparably, the tasks entailed by a given job, the properties required of its occupants (e.g., diplomas) and the corresponding advantages, both material and symbolic (the name), are an institutionalized, theatrical version of the incessant struggles over the classifications which help to produce the classes, although these classifications are the product of the struggles between the classes and depend on the power relations between them.

The Reality of Representation and the Representation of Reality

The classifying subjects who classify the properties and practices of others, or their own, are also classifiable objects which classify themselves (in the eyes of others) by appropriating practices and properties that are already classified (as vulgar or distinguished, high or low, heavy or light etc. - in other words, in the last analysis, as popular or bourgeois) according to their probable distribution between groups that are themselves classified. The most classifying and best classified of these properties are, of course, those which are overtly designated to function as signs of distinction or marks of infamy, stigmata, especially the names and titles expressing class membership whose intersection defines social identity at any given time - the name of a nation, a region, an ethnic group, a family name, the name of an occupation, an educational qualification, honorific titles and so on. Those who classify themselves or others, by appropriating or classifying practices or properties that are classified and classifying, cannot be unaware that, through distinctive objects or practices in which their 'powers' are expressed and which, being appropriated by and appropriate to classes, classify those who appropriate them, they classify themselves in the eyes of other classifying (but also classifiable) subjects, endowed with classificatory schemes analogous to those which enable them more or less adequately to anticipate their own classification.

Social subjects comprehend the social world which comprehends them. This means that they cannot be characterized simply in terms of material properties, starting with the body, which can be counted and measured like any other object in the physical world. In fact, each of these properties, be it the height or volume of the body or the extent of landed property, when perceived and appreciated in relation to other properties of the same class by agents equipped with socially constituted schemes of perception and appreciation, functions as a symbolic property. It is therefore necessary to move beyond the opposition between a 'social physics' -which uses statistics in objectivist fashion to establish distributions (in both the statistical and economic senses), quantified expressions of the differential appropriation of a finite quantity of social energy by a large number of competing individuals, identified through 'objective indicators' - and a 'social semiology' which seeks to decipher meanings and bring to light the cognitive operations whereby agents produce and decipher them. We have to refuse the dichotomy between, on the one hand, the aim of arriving at an objective 'reality', 'independent of individual consciousnesses and wills', by breaking with common representations of the social world (Durkheim's 'pre-notions'), and of uncovering 'laws' - that is, significant (in the sense of non-random) relationships between distributions - and, on the other hand, the aim of grasping, not 'reality', but agents' representations of it, which are the whole 'reality' of a social world conceived 'as will and representation'.

In short, social science does not have to choose between that form of social physics, represented by Durkheim - who agrees with social semiology in acknowledging that one can only know 'reality' by applying logical instruments of classification²³ - and the idealist semiology which, undertaking to construct 'an account of accounts', as Harold Garfinkel puts it, can do no more than record the recordings of a social world which is ultimately no more than the product of mental, i.e., linguistic, structures. What we have to do is to bring into the science of scarcity, and of competition for scarce goods, the practical knowledge which the agents obtain for themselves by producing - on the basis of their experience of the distributions, itself dependent on their position in the distributions - divisions and classifications which are no less objective than those of the balance-sheets of social physics. In other words, we have to move beyond the opposition between objectivist theories which identify the social classes (but also the sex or age classes) with discrete groups, simple countable populations separated by boundaries objectively drawn in reality, and subjectivist (or marginalist) theories which reduce the 'social order' to a sort of collective classification obtained by aggregating the individual classifications or, more precisely, the individual strategies, classified and classifying, through which agents class themselves and others.

One only has to bear in mind that goods are converted into distinctive signs, which may be signs of distinction but also of vulgarity, as soon as they are perceived relationally, to see that the representation which individuals and groups inevitably project through their practices and properties is an integral part of social reality. A class is defined as much by its *being-perceived* as by its *being*, by its consumption - which need not be conspicuous in order to be symbolic - as much as by its position in the relations of production (even if it is true that the latter governs the former). The Berkeleian - i.e., petit-bourgeois - vision which reduces social being to perceived being, to seeming, and which, forgetting that there is no need to give theatrical performances (*representations*) in order to be the object of mental representations, reduces the social world to the sum of the (mental) representations which the various groups have of the theatrical performances put on by the other groups, has the virtue of insisting on the relative autonomy of the logic of symbolic representations with respect to the material determinants of socio-economic condition. The individual or collective classification struggles aimed at transforming the categories of perception and appreciation of the social world and, through this, the social world itself, are indeed a forgotten dimension of the class struggle. But one only has to realize that the classificatory schemes which underlie agents' practical relationship to their condition and the representation they have of it are themselves the product of that condition, in order to see the limits of this autonomy. Position in the classification struggle depends on position in the class structure; and social subjects - including intellectuals, who are not those best placed to grasp that which defines the limits of their thought of the social world, that is, the illusion of the absence of limits - are perhaps never less likely to transcend 'the limits of their minds' than in the representation they have and give of their position, which defines those limits.

L'articulation psychosociologique et les relations entre groupes (Brussels: A. de Boeck, 1976), pp. 178-200.

- 21 'Wherever the groups and classes are set in sharp juxtaposition, the values and mores of each are juxtaposed. Out of group opposition there arises an intense opposition of values, which comes to be projected through the social order and serves to solidify social stratification.' L. Copeland, 'The Negro as a Contrast Conception' in E. Thompson (ed.), *Race Relations and the Race Problem* (Durham, NC: Duke University Press, 1959), pp. 152-79.
- 22 '... le pouvoir unificateur du nom, du mot d'ordre' - the unifying power of the name/noun, the rallying cry ('order word'). (Translator's note.)
- 23 One scarcely needs to point out the affinity between social physics and the positivist inclination to see classifications either as arbitrary, 'operational' divisions (such as age groups or income brackets) or as 'objective' cleavages (discontinuities in distributions or bends in curves) which only need to be recorded.
- 24 Here is a particularly revealing expression (even in its metaphor) of this social marginalism: 'Each individual is responsible for the demeanour image of himself and the deference image of others, so that for a complete man to be expressed, individuals must hold hands in a chain of ceremony, each giving deferentially with proper demeanour to the one on the right what will be received deferentially from the one on the left.' E. Goffmann, 'The Nature of Deference and Demeanour', *American Anthropologist*, 58 (June 1956), 473-502. '... routinely the question is that of whose opinion is voiced most frequently and most forcibly, who makes the minor ongoing decisions apparently required for the coordination of any joint activity, and whose passing concerns have been given the most weight. And however trivial some of these *little gains and losses* may appear to be, *by summing them all up* across all the social situations in which they occur, we can see that their total effect is enormous. The expression of subordination and domination through this swarm of situational means is more than a mere tracing or symbol or ritualistic affirmation of the social hierarchy. These expressions *considerably constitute* the hierarchy.' E. Goffmann, 'Gender Display'. Post-structuralism, Deconstruction, Post-modernism

Introduction: Introductory Deconstruction

Julie Rivkin and Michael Ryan

Around 1967 in Paris, Structuralism, which had dominated French intellectual life for much of the 1960s, was displaced by a new intellectual movement. The new thinking in philosophy, sociology, and literature that began to emerge around 1967 in the work of such French thinkers as Jacques Derrida, Julia Kristeva, Gilles Deleuze, Luce Irigaray, Helene Cixous, Jean-Francois Lyotard, and Jean Baudrillard is usually referred to as Post-structuralism because it departed so radically from the core assumptions of Structuralism. In 1979, Lyotard wrote a book called *The Post-Modern Condition* that described the contemporary era as one in which the old "grand narratives" of the world, from Humanism to Marxism, had lost their validity and been replaced by a proliferation of "micro" stories. Lyotard borrowed the term "Post-Modernism" from US culture, where it had been used to describe a self-reflexive style of writing that broke with standard literary conventions. Almost immediately, "Post-modernism" began to be applied to both the contemporary era and to Post-structuralism.

Another term widely associated with Post-structuralism is "deconstruction." Deconstruction is the name of a method of critique developed by Jacques Derrida, a philosopher whose writing is central to the emergence of Post-structuralism. In 1967, he published three books that effectively put an end to Structuralism and launched a new era in French intellectual life. The books were *Writing and Difference*, *Of Grammatology*, and *Speech and Phenomenon*. The first was a collection of essays on philosophy and literature; the second a long critical reading of Levi-Strauss, Saussure, and Rousseau; the third a "deconstruction" of the *Logical Investigations* of Edmund Husserl.

What did Derrida do that was so revolutionary? He began with the concept of difference that he found in the work of Friedrich Nietzsche, Martin Heidegger, and Ferdinand de Saussure. It recalled for him the work of Greek philosophers who stood outside the dominant Greek tradition of Aristotle and Plato. For Aristotle, knowledge consists of the analysis of objects in terms of their essences; Plato invented the "metaphysical" notion of an ideal realm of ideas that transcended or existed outside and apart from physical reality. The so-called "pre-Socratic" philosophers, on the other hand, were interested in the process of space and time that wove together all material objects in a "sumplokē," or confluence, of being. They emphasized change over stasis and the blending together of things over their discreteness or separable identities.

Derrida brought these related strains of thought together. He began by focusing on Saussure's concept of the diacritical nature of the linguistic sign, according to which the identity of a sign is constituted by its differences from other signs. For this to be the case, according to Derrida, there had to be a more primordial process of differentiation at work that affected everything having to do with language, thought, and reality. His name for this more primordial process was "*differance*" by which he meant a simultaneous process of deferment in time and difference in space. One present moment assumes past present moments as well as future present moments; to be "present," a present moment presupposes its difference from other presents. Similarly, the presence of an object of conscious perception or of a thought in the mind is shaped by its difference from other objects or thoughts. This simultaneous movement of temporal deferment and spatial difference, both ongoing processes that constitute being, are what Derrida means by "*differance*." Ideas and things are like signs in language; there are no identities, only differences.

This idea challenged the central assumptions of metaphysics. According to that tradition, the most fundamental or foundational components of knowledge and the criteria of truth were presence, substance, essence, and identity - not difference. True ideas were present to consciousness, and the essence of a thing consisted of its being fully present to itself. But such presence, according to Derrida, is produced by spatial differences and temporal delays, in short, by *differance*. When you point to a presence (of a thing or of an idea), you are referred to some other from which it differs. Each presence bears the "trace" of its others. When you see the world, what you see is not identities but a network of relations between things whose difference from one another allows them to appear to be separate and identifiable. What is present to the mind in conscious experience is a kind of ghost effect, a flickering of passing moments that are differentially constituted by their relations and their inter-connectedness. They have no full, substantial presence (much as a flicking of cards of slightly different pictures of the same thing creates the effect of seeing the actual thing in motion).

The same is true of ideas in the mind. When philosophers think of a concept like "nature" that is distinct from "culture," they are in fact using concepts that could not exist as identities apart from their difference from one another. The difference between the two concepts must preexist the concepts. The concept of nature is simply the concept of culture differed and deferred. It is the *differance* of culture. One important implication of this insight is that if all things (all objects, ideas, and words) are produced as identities by their differences from other things, then a complete determination of identity (a statement of what something "is" fully and completely "in itself") would require an endless inventory of relations to other terms in a potentially infinite network of differences. Truth, as a result, will always be incomplete.

To say that reality and thought are differential is to say that they are like signs. Derrida noted that the structure of signification is a structure of difference. Signs refer to something else - an idea or an object - from which they differ. Either they represent an idea which they signify in order to mean something, or, they must substitute for the presence of an object in the world that they designate. In either case, the ideas and the objects are of a different order of being from signs. The identity, presence, and substance of the sign are constituted by or as difference. Moreover, all signifiers relate to an other - the signified - that makes their identity

relational and differential. And all signifieds are in turn themselves differential; they too are signifiers. They consist of the reference from one thing to another. Reference inhabits reality and makes it possible.

If every object derives its identity from its difference from other objects, then every thing or object and every idea or concept refers to something else to be what it "is." Like signifiers, all things bear the "trace" of something to which they refer in an ongoing network of relays and references. The structure of signification is internal to reality and to thought. Yet signification is normally thought of as something added on to reality that stands outside its substantive presence. Reality is matter, and signification is a network of differences.

Yet, if all things are produced by difference, then the very criterion that separates signification in language from thought and reality - that it operates through the substitution of one thing for another and that the sign refers to something other in order to be what it "is" - no longer holds. Because the presence of a thing or of an idea depends on something other than itself, it too is a sign. To determine what an idea in the mind "is," one must shuttle from it to the others whose difference shapes it. Each one substitutes or stands in for the first, much as a sign stands in for the thing it designates.

What this suggests is that no presence or substance of an object or of an idea is complete in itself. Each presence requires supplementation by something else to which it refers or relates and from which it differs. This accounts for one of Derrida's more controversial ideas - that of the "supplement at the origin." By this, he meant that if one tries to grasp the presence of something, one encounters a difference, not something substantial. One term, an other, slips in through a differential relation and takes the place of the first. As a result, one must say that there is no "first." The second term takes its place immediately because the "first" depends on its difference from the second to "be" anything. Instead of an original presence, what one encounters is a supplementary relationship between terms.

Another way of putting this is to say that the movement of signification, whereby one thing refers to another in a relationship of difference, allows the presence of ideas and objects to come into being in the first place. Signification is therefore not something standing outside presence (the presence of ideas or of objects) that is added on later to an already intact and constituted presence. Presence cannot exist without being from the very outset caught up in the movement of difference and signification. In his early work, Derrida used the word "text" to refer to the way the structure of difference in reality resembles signification, and this accounts for his conclusion that all reality is "textual." That is, it is made possible by difference, the inter-supplementation of terms, the trace structure whereby one thing depends on others to be what it "is," and the referential character of identity.

That insight poses a threat to the metaphysical tradition in philosophy that Plato initiated. Metaphysical philosophy founded itself on the assumption that signification was an external contrivance added on to the substance of reality and to the ideality of thought. Metaphysics assumed especially that ideas exist apart from signs and that the presence that guarantees truth in the mind exists prior to all signification. It is this kind of belief that allowed, for example, the New Critics to claim that poetry embodies ideas that are universal. The New Criticism assumes that ideas are of a different ideal order than the physical and technical mechanisms of signification.

This kind of assumption, according to Derrida, is an inflection of the metaphysical tradition of philosophy that posited the possibility of a "transcendental signified," the possibility that ideas somehow exist apart from signification. Such ideas are not themselves signifiers; they exist outside the differential network that makes signification possible. Once this standard of transcendent truth is established, it becomes normative, a measure of value. In relation to its supposed truthfulness, a host of other terms associated with signification and connoting difference could be declared to be secondary and derivative, a falling away from the standard and a depletion of substance. They are often associated with immorality in the metaphysical tradition as well as with writing, that purely external, empty technique that bears no immediate relationship to the living voice of consciousness, that other criterion of truthfulness in the metaphysical tradition.

In criticizing this tradition, Derrida noticed that metaphysical philosophy's metaphors, the way it described its fundamental values, were supposed to be added on to that philosophy's truth, yet truth was created by using metaphors that were never accounted for. The most powerful of these metaphors was the spatial distinction between an inside and an outside. Derrida noted that the metaphysical system of thought simply took for granted that one could differentiate between an inside and an outside without recourse to a technique such as differentiation that had not been accounted for. The inside of thought and of reality was described as being present to itself, full, immediate, natural, true, substantive, and prior to all signifying substitution. The outside was described as the realm of signification that was added on to thought and to reality. The living voice of consciousness for this reason was declared superior to mere writing, an external artificial contrivance that was a dead letter, not a living, breathing presence. The substance of objects was conceived as an internal essence that owed nothing to external relations. But, Derrida noted, it is the act of spatial differentiation that allows one to think of inside and outside, truth and falsity, substance and representation, etc. in the first place. This act of spatial differentiation precedes and makes possible the foundations of metaphysics, its most basic values and ideals, ideals that supposedly sanctified the superiority and priority of identity to difference and of the interiority of mental ideas to the spatialization associated with external writing. It is not so much that the outside is declared to be inside in a simple inversion of premises; rather, a more primordial process of differentiation is shown to encompass both inside and outside so that the distinction between the two becomes untenable.

As a result of this argument, all the values of the metaphysical tradition had to be put in question because they all assumed the primacy and the priority of presence, substance, and identity as foundations while nonetheless describing the fact that difference, something insubstantial and nonpresent, made them possible. All of the categories and hierarchies that placed presence over difference, immediacy over mediation, identity over substitution, nature over culture, speech in the mind over external writing, essence over accident, substance over technology, etc., have to be rethought. It is no longer possible to characterize difference, substitution, repetition, and the like as nontruth if the truthfulness of true ideas, their presence in the mind as something palpable, present, and immediate, itself depends on difference and is produced by *difference*.

If one could not rigorously distinguish between the realm of signification and the realms of thought and reality because thought and reality are also differential, then

the criterion for distinguishing signification from reality no longer holds, and the metaphysical value system collapses. The basis for a number of metaphysical prejudices was thereby discredited. The authentic, the original, the natural, the living, the immediate, and the present could no longer be declared normal, standard, and more true than terms connoting artifice, derivation, substitution, difference, and representational repetition. All of our notions of authenticity, originality, and the like that were sustained by the fiction of a truth completely separate from the structure of signification have to be rethought. In literature especially, it becomes important to reexamine all of those moments where virtue is described as what is authentic, present to itself, self-identical, aloof from signs, true, and real, while vice is described as what is artificial, changeable, infected by the ruses of signification, false, and unreal. According to Derrida, what one will find is that the authentic will itself prove to be an artifact, the original derivative, the self-identical a double, the natural itself contrived and conventional, substance itself form, etc.

Moreover, one can no longer assume, as New Critics did, for example, that signs are physical, while thought is spiritual or ideal, that one is a realm of artifice and representation, the other of universal truth. Literary texts do not harbor "transcendental signifieds," points where truth appears in a realm separated entirely from signifiers. Such apparent moments of meaning or truth also pertain to the order of signification and difference. They too are signifiers. To point to the presence of an idea, a truth, or a meaning in a work of literature is to point to something whose identity depends on its difference from other terms in an endless chain of supplements.

If the old metaphysical ideas regarding a transcendental signified that stands outside signifying substitution are disabled in this way, what results is a world in which the grounding of truth in some authority becomes much more difficult. If behind or within the old model of truth as a ground outside signification is merely more signification, then in essence, we have arrived at a conventionalist theory of truth. The notion that truth is a presence or essence in consciousness that is a ground of authority is no longer feasible. If such presence is inseparable from representation, then like representation, it is shaped by conventions regarding how those acts of representation work. It must be haggled over and settled on through agreements. It is not a natural substance that is self-identical and aloof from differences that shape it; rather it is a formal arrangement that is contingent on other things than "itself." What it is "in itself" is a performance or rehearsal of those conventions, codes, and agreements, which means, of course, that it is not really something "in itself."

We have spent so much time on Derrida's ideas because those ideas are central to what happened afterwards in the work of such thinkers as Irigaray, Cixous, Deleuze, and Lyotard. Their work reflects the shift Derrida engineered away from the centrality of consciousness in philosophical discussion and toward a sense that the world is a field of contingency, not natural order, that the identities of truth that philosophy takes for granted are unstable, that the truthful orders of value we live by may be rhetorical acts of linguistic meaning-making, rather than representations of preexisting truth, that the substance of thought and of reality conceals insubstantial processes that constitute them, etc. Deleuze's move from the arboresque to the rhizomatic, Kristeva's move from the symbolic to the semiotic, Lyotard's move from grand narratives to micro-narratives, Cixous and Irigaray's move from the phallogocentric to the feminine - all bear the imprint of Derrida's move from substance, presence, and identity to *différance*.

On Truth and Lying in an Extra-moral Sense

Friedrich Nietzsche

Doubts regarding the ability of the human mind to attain certain knowledge of the kind Positivism promised began to arise in the late nineteenth century. Positivism had so dominated the early nineteenth century that few questioned the ability of the mind to achieve a purely factual, scientific knowledge of the world. Using the very observations regarding perception that science itself produced, Friedrich Nietzsche (1844-1900), a German philosopher best known for his writings about early Greek philosophy, began to question in this early essay (1873) the assumptions regarding the certainty of knowledge that dominated his culture.

The intellect, as a means for the preservation of the individual, develops its chief power in dissimulation____ What indeed does man know about himself? Oh! that he could but once see himself complete, placed as it were in an illuminated glass-case! Does not nature keep secret from him most things, even about his body, e.g., the convolutions of the intestines, the quick flow of the blood-currents, the intricate vibrations of the fibers, so as to banish and lock him up in proud, delusive knowledge? Nature threw away the key; and woe to the fateful curiosity which might be able for a moment to look out and down through a crevice in the chamber of consciousness, and discover that man, indifferent to his own ignorance, is resting on the pitiless, the greedy, the insatiable, the murderous and, as it were, hanging in dreams on the back of a tiger?...

[W]hat after all are those conventions of language? Are they possibly products of knowledge, of the love of truth; do the designations and the things coincide? Is language the adequate expression of all realities?

Only by means of forgetfulness can man ever arrive at imagining that he possesses "truth" in that degree just indicated. If he does not mean to content himself with truth in the shape of tautology, that is, with empty husks, he will always obtain illusions instead of truth. What is a word? The expression of a nerve-stimulus in sounds. But to infer a cause outside us from the nerve-stimulus is already the result of a wrong and unjustifiable application of the proposition of causality. How should we dare, if truth with the genesis of language, if the point of view of certainty with the designations had alone been decisive; how indeed should we dare to say: the stone is hard; as if "hard" was known to us otherwise; and not merely as an entirely subjective stimulus. We divide things according to genders; we designate the tree as masculine [*der Baum* in German], the plant as feminine [*die Pflanze* in German]:

what arbitrary metaphors! How far flown beyond the canon of certainty! We speak of a "serpent"; the designation fits nothing but the sinuosity, and could therefore also appertain to the worm. What arbitrary demarcations! what one-sided preferences given sometimes to this, sometimes to that quality of a thing! The different languages placed side by side show that with words truth or adequate expression matters little: for otherwise there would not be so many languages ____ A nerve-stimulus, first transformed into a percept! First metaphor! The percept again copied into a sound! Second metaphor! And each time he leaps completely out of one sphere right into the midst of an entirely different one....

Let us especially think about the formation of ideas. Every word becomes at once an idea not by having, as one might presume, to serve as a reminder for the original experience happening but once and absolutely individualized, to which experience such word owes its origin, no, but by having simultaneously to fit innumerable, more or less similar (which really means never equal, therefore altogether unequal) cases. Every idea originates through equating the unequal. As certainly as no one leaf is exactly similar to any other, so certain is it that the idea "leaf" has been formed through an arbitrary omission of these individual differences, through a forgetting of the differentiating qualities, and this idea now awakens the notion that in nature there is, besides the leaves, a something called "the leaf," perhaps a primal form according to which all leaves were woven, drawn, accurately measured, colored, crinkled, painted, but by unskilled hands, so that no copy had turned out correct and trustworthy as a true copy of the primal form ____

What therefore is truth? A mobile army of metaphors, metonymies, anthropomorphisms: in short a sum of human relations which became poetically and rhetorically intensified, metamorphosed, adorned, and after long usage seem to a notion fixed, canonic, and binding; truths are illusions of which one has forgotten that they *are* illusions; worn-out metaphors which have become powerless to affect the senses; coins which have their obverse effaced and now are no longer of account as coins but merely as metal.

Still we do not yet know whence the impulse to truth comes, for up to now we have heard only about the obligation which society imposes in order to exist: to be truthful, that is, to use the usual metaphors, therefore expressed morally: we have heard only about the obligation to lie according to a fixed convention, to lie gregariously in a style binding for all. Now man of course forgets that matters are going thus with him; he therefore lies in that fashion pointed out unconsciously and according to habits of centuries' standing - and by *this very unconsciousness*, by this very forgetting, he arrives at a sense for truth. Through this feeling of being obliged to designate one thing as "red," another as "cold," a third one as "dumb," awakes a moral emotion relating to truth. Out of the antithesis "liar" whom nobody trusts, whom all exclude, man demonstrates to himself the venerableness, reliability, usefulness of truth. Now as a "*rational*" being he submits his actions to the sway of abstractions; he no longer suffers himself to be carried away by sudden impressions, by sensations, he first generalizes all these impressions into paler, cooler ideas, in order to attach to them the ship of his life and actions. Everything which makes man stand out in bold relief against the animal depends on this faculty of volatilizing the concrete metaphors into a schema, and therefore resolving a perception into an idea. For within the range of those schemata a something becomes possible that never could succeed under the first perceptual impressions: to build up a pyramidal order

with castes and grades, to create a new world of laws, privileges, sub-orders, delimitations, which now stands opposite the other perceptual world of first impressions and assumes the appearance of being the more fixed, general, known, human of the two and therefore the regulating and imperative one. Whereas every metaphor of perception is individual and without its equal and therefore knows how to escape all attempts to classify it, the great edifice of ideas shows the rigid regularity of a Roman Columbarium and in logic breathes forth the sternness and coolness which we find in mathematics. He who has been breathed upon by this coolness will scarcely believe that the idea too, bony and hexahedral, and permutable as a die, remains however only as the *residuum of a metaphor*, and that the illusion of the artistic metamorphosis of a nerve-stimulus into percepts is, if not the mother, then the grandmother of every idea. Now in this game of dice, "Truth" means to use every die as it is designated, to count its points carefully, to form exact classifications, and never to violate the order of castes and the sequences of rank -----

One may here well admire man, who succeeded in piling up an infinitely complex dome of ideas on a movable foundation and as it were on running water, as a powerful genius of architecture. Of course in order to obtain hold on such a foundation it must be as an edifice piled up out of cobwebs, so fragile, as to be carried away by the waves: so firm, as not to be blown asunder by every wind. In this way man as an architectural genius rises high above the bee; she builds with wax, which she brings together out of nature; he with the much more delicate material of ideas, which he must first manufacture within himself. He is very much to be admired here - but not on account of his impulse for truth, his bent for pure cognition of things. If somebody hides a thing behind a bush, seeks it again and finds it in the self-same place, then there is not much to boast of, respecting this seeking and finding; thus, however, matters stand with the seeking and finding of "truth" within the realm of reason. If I make the definition of the mammal and then declare after inspecting a camel, "Behold a mammal," then no doubt a truth is brought to light thereby, but it is of very limited value, I mean it is anthropomorphic through and through, and does not contain one single point which is "true-in-itself," real and universally valid, apart from man. The seeker after such truths seeks at the bottom only the metamorphosis of the world in man, he strives for an understanding of the world as a human-like thing and by his battling gains at best the feeling of an assimilation. Similarly, as the astrologer contemplated the stars in the service of man and in connection with their happiness and unhappiness, such a seeker contemplates the whole world as related to man, as the infinitely protracted echo of an original sound: man; as the multiplied copy of the one arch-type: man. His procedure is to apply man as the measure of all things, whereby he starts from the error of believing that he has these things immediately before him as pure objects. He therefore forgets that the original metaphors of perception are metaphors, and takes them for the things themselves.

Only by forgetting that primitive world of metaphors, only by the congelation and coagulation of an original mass of similes and percepts pouring forth as a fiery liquid out of the primal faculty of human fancy, only by the invincible faith, that *this* sun, *this* window, *this* table is a truth in itself: in short, only by the fact that man forgets himself as subject, and what is more as an *artistically creating* subject: only by all this does he live with some repose, safety, and consequence. If he were able to get out of the prison walls of this faith, even for an instant only, his "self-consciousness" would be destroyed at once. Already it costs him some trouble to admit to himself that the

insect and the bird perceive a world different from his own, and that the question, which of the two world-perceptions is more accurate, is quite a senseless one, since to decide this question it would be necessary to apply the standard of *right perception*, i.e. to apply a standard which *does not exist*. On the whole it seems to me that the "right perception" - which would mean the adequate expression of an object in the subject - is a nonentity full of contradictions: for between two utterly different spheres, as between subject and object, there is no causality, no accuracy, no expression, but at the utmost an aesthetical relation, I mean a suggestive metamorphosis, a stammering translation into quite a distinct foreign language, for which purpose however there is needed at any rate an intermediate sphere, an intermediate force, freely composing and freely inventing.

The Will to Power

Friedrich Nietzsche

Nietzsche died before being able to complete what was to be his major work, *The Will to Power* (1885-6). In it, he argues that the essential drive in all life is a yearning for mastery. Nietzsche links this yearning to knowledge. When we know the world, we master its temporally fluid and spatially diverse reality by fixing identities with words. For Nietzsche, philosophical courage consists of being able to tolerate the nonidentical and meaningless character of existence without having to resort to words that posit identities or meanings in things. The world merely exists (what he calls the "eternal return" of the same), and there is no theological origin or conclusion to history. This skepticism regarding the likelihood of a separate spiritual realm in existence carries over into Post-Structuralism, which also questions the more secular versions of this ideal of transcendence, especially the notion that the realm of meaning is essentially distinct from the realm of signification. When the Post-Structuralists declare that there is no "transcendental signified," they are echoing Nietzsche's claim that there is teleology, no theological origin or goal to the world.

499

"Thinking" in primitive conditions (pre-organic) is the crystallization of forms, as in the case of crystal. - In *our* thought, the essential feature is fitting new material into old schemas ("Procrustes" = bed), *making* equal what is new.

500

... The same equalizing and ordering force that rules in the idioplasm, rules also in the incorporation of the outer world: our sense perceptions are already the result of this assimilation and equalization in regard to *all* the past in us; they do not follow directly upon the "impression" -

501

All thought, judgment, perception, considered as comparison, has as its precondition a "*positing* of equality," and earlier still a "*making* equal." The process of making equal is the same as the process of incorporation of appropriated material in the amoeba.

511

Equality and similarity.

- 1 The coarser organ sees much apparent equality;
- 2 the mind *wants* equality, i.e., to subsume a sense impression into an existing series: in the same way as the body *assimilates* inorganic matter.

Toward an understanding of logic: *the will to equality is the will to power* - the belief that something is thus and thus (the essence of *judgment*) is the consequence of a will that things as much as possible *shall be* equal.

512

Logic is bound to the condition: assume there are identical cases. In fact, to make possible logical thinking and inferences, this condition must first be treated fictitiously as fulfilled. That is: the will to logical truth can be carried through only after a fundamental *falsification* of all events is assumed. From which it follows that a drive rules here that is capable of employing both means, firstly falsification, then the implementation of its own point of view: logic does *not* spring from the will to truth.

513

The inventive force that invented categories labored in the service of our needs, namely of our need for security, for quick understanding on the basis of signs and sounds, for means of abbreviation: "substance," "subject," "object," "being," "becoming" have nothing to do with metaphysical truths. -

It is the powerful who made the names of things into law, and among the powerful it is the greatest artists in abstraction who created the categories.

514

A morality, a mode of living tried and *proved* by long experience and testing, at length enters consciousness as a law, as *dominating* - And therewith the entire group of related values and states enters into it: it becomes venerable, unassailable, holy, true; it is part of its development that its origin should be forgotten - That is a sign it has become master -

Exactly the same thing could have happened with the categories of reason: they could have prevailed, after much groping and fumbling, through their relative utility - There came a point when one collected them together, raised them to consciousness as a whole - and when one commanded them, i.e., when they had the effect of a command - From then on, they counted as a priori, as beyond experience, as irrefutable. And yet perhaps they represent nothing more than the expediency of a certain race and species - their utility alone is their "truth" -

515

Not "to know" but to schematize - to impose upon chaos as much regularity and form as our practical needs require ____

516

We are unable to affirm and to deny one and the same thing: this is a subjective empirical law, not the expression of any "necessity" but only of an inability.

If, according to Aristotle, the law of contradiction is the most certain of all principles, if it is the ultimate and most basic, upon which every demonstrative proof rests, if the principle of every axiom lies in it; then one should consider all the more rigorously what *presuppositions* already lie at the bottom of it. Either it asserts something about actuality, about being, as if one already knew this from another source; that is, as if opposite attributes *could* not be ascribed to it. Or the proposition means: opposite attributes *should* not be ascribed to it. In that case, logic would be an imperative, not to know the true, but to posit and arrange a world that shall be called true by us.

In short, the question remains open: are the axioms of logic adequate to reality or are they a means and measure for us to *create* reality, the concept "reality," for ourselves? - To affirm the former one would, as already said, have to have a previous knowledge of being - which is certainly not the case. The proposition therefore contains no *criterion of truth*, but an *imperative* concerning that which *should* count as true....

517

In order to think and infer it is necessary to assume beings: logic handles only formulas for what remains the same. That is why this assumption would not be proof of reality: "beings" are part of our perspective. The "ego" as a being (- not affected by becoming and development).

The fictitious world of subject, substance, "reason," etc., is needed - : there is in us a power to order, simplify, falsify, artificially distinguish. "Truth" is the will to be master over the multiplicity of sensations: - to classify phenomena into definite categories. In this we start from a belief in the "in-itself" of things (we take phenomena as *real*).

The character of the world in a state of becoming as incapable of formulation, as "false," as "self-contradictory." Knowledge and becoming exclude one another. Consequently, "knowledge" must be something else: there must first of all be a will to make knowable, a kind of becoming must itself create the deception of beings...

542

If the character of existence should be false - which would be possible - what would truth, all our truth, be then? - An unconscionable falsification of the false? The false raised to a higher power? -

543

In a world that is essentially false, truthfulness would be an antinatural tendency: such a tendency could have meaning only as a means to a higher power of falsehood. In order for a world of the true, of being, to be invented, the truthful man would first have to be created (including the fact that such a man believes himself "truthful").

Simple, transparent, not in contradiction with himself, durable, remaining always the same, without wrinkle, fold, concealment, form: a man of this kind conceives a world of being as "God" in his own image.

For truthfulness to be possible, the whole sphere of man must be very clean, small, and respectable; advantage in every sense must be with the truthful man. -Lies, deception, dissimulation must arouse astonishment -...

552

When one has grasped that the "subject" is not something that creates effects, but only a fiction, much follows.

It is only after the model of the subject that we have invented the reality of things and projected them into the medley of sensations. If we no longer believe in the effective subject, then belief also disappears in effective things, in reciprocation, cause and effect between those phenomena that we call things.

There also disappears, of course, the world of effective atoms: the assumption of which always depended on the supposition that one needed subjects.

At last, the "thing-in-itself" also disappears, because this is fundamentally the conception of a "subject-in-itself." But we have grasped that the subject is a fiction. The antithesis "thing-in-itself and "appearance" is untenable; with that, however, the concept "appearance" also disappears.

If we give up the effective subject, we also give up the object upon which effects are produced. Duration, identity with itself, being are inherent neither in that which is called subject nor in that which is called object: they are complexes of events apparently durable in comparison with other complexes - e.g., through the difference in tempo of the event (rest-motion, firm-loose: opposites that do not exist in themselves and that actually express only variations in degree that from a certain perspective appear to be opposites. There are no opposites: only from those of logic do we derive the concept of opposites - and falsely transfer it to things).

If we give up the concept "subject" and "object," then also the concept "substance" — and as a consequence also the various modifications of it, e.g., "matter," "spirit," and other hypothetical entities, "the eternity and immutability of matter," etc. We have got rid of *materiality*.

From the standpoint of morality, the world is false. But to the extent that morality itself is a part of this world, morality is false.

Will to truth is a making firm, a making true and durable, an abolition of the false character of things, a reinterpretation of it into beings. "Truth" is therefore not something there, that might be found or discovered - but something that must be created and that gives a name to a process, or rather to a will to overcome that has in

itself no end - introducing truth, as a *processus in infinitum*, an active determining -not a becoming conscious of something that is in itself firm and determined. It is a word for the "will to power."

Life is founded upon the premise of a belief in enduring and regularly recurring things; the more powerful life is, the wider must be the knowable world to which we, as it were, attribute being. Logicizing, rationalizing, systematizing as expedients of life.

Man projects his drive to truth, his "goal" in a certain sense, outside himself as a world that has being, as a metaphysical world, as a "thing-in-itself," as a world already in existence. His needs as creator to invent the world upon which he works, anticipate it; this anticipation (this "belief in truth") is his support...

Man seeks "the truth": a world that is not self-contradictory, not deceptive, does not change, a *true* world - a world in which one does not suffer; contradiction, deception, change - causes of suffering! He does not doubt that a world as it ought to be exists; he would like to seek out the road to it. (Indian critique: even the "ego" as apparent, as not real.)

Whence does man here derive the concept reality? - Why is it that he derives *suffering* from change, deception, contradiction? and why not rather his happiness? -

Contempt, hatred for all that perishes, changes, varies - whence comes this valuation of that which remains constant? Obviously, the will to truth is here merely the desire for a world of the constant.

The senses deceive, reason corrects the errors; consequently, one concluded, reason is the road to the constant; the least sensual ideas must be closest to the "true world." - It is from the senses that most misfortunes come - they are deceivers, deluders, destroyers. -

Happiness can be guaranteed only by being; change and happiness exclude one another. The highest desire therefore contemplates unity with what has being. This is the formula for: the road to the highest happiness.

In summa: the world as it ought to be exists; this world, in which we live, is an error - this world of ours ought not to exist.

Belief in what has being is only a consequence: the real *primum mobile* is disbelief in becoming, mistrust of becoming, the low valuation of all that becomes -

What kind of man reflects in this way? An unproductive, suffering kind, a kind weary of life. If we imagine the opposite kind of man, he would not need to believe in what has being; more, he would despise it as dead, tedious, indifferent -

The belief that the world as it ought to be is, really exists, is a belief of the unproductive who do *not desire to create a world* as it ought to be. They posit it as already available, they seek ways and means of reaching it. "Will to truth" - *as the failure of the will to create....*

Whoever is incapable of laying his will into things, lacking will and strength, at least lays some *meaning* into them, i.e., the faith that there is a will in them already.

It is a measure of the degree of strength of will to what extent one can do without meaning in things, to what extent one can endure to live in a meaningless world *because one organizes a small portion of it oneself...*

Overthrowing of philosophers through the destruction of the world of being: intermediary period of nihilism: before there is yet present the strength to reverse values and to deify becoming and the apparent world as the only world, and to call them good...

Identity and Difference

Martin Heidegger

With Friedrich Nietzsche, Martin Heidegger (1889-1976) played a crucial role in the development of Derrida's deconstructive philosophy. Heidegger in *Being and Time* (1937) situated philosophy in the world of existence and displaced the purely rationalist focus that had preoccupied philosophy for several centuries. In this selection from his essay "Identity and Difference" (1957), he elaborates on the necessity of difference to any determination of identity.

Metaphysics thinks Existence as such, in general. Metaphysics thinks Existence as such, that is, in the Whole. Metaphysics thinks the Being of Existence in the fathoming unity of the greatest generality, that is, the universal equivalence, as well as in the understanding unity of totality, which is highest above all else. Thus, we presuppose the Being of Existence as authenticating reason. Hence, all metaphysics is, basically, the fathoming from the very bottom, reasoning which renders account of the ground, replies, and finally calls it to account ____

[A]lways and everywhere Being means the Being of Existence ...

[I]n the case of the Being of Existence and the Existence of Being we are concerned every time with a difference.

We think of Being, therefore, as object only when we think it as different from Existence and think Existence as different from Being. Thus difference proper emerges. If we attempt to form an image of it, we shall discover that we are immediately tempted to comprehend difference as a relation which our thinking has added to Being and to Existence. As a result, difference is reduced to a distinction, to a product of human intelligence.

However, let us assume for once that difference is an addition resulting from our forming of a mental image, then the problem arises: An addition to what? And the answer we get is: to Existence. Well and good. But what do we mean by this "Existence"? What else do we mean by it than such as it is? Thus we accommodate the alleged addition, the idea of a difference, under Being. Yet, "Being" itself proclaims: Being which is *Existence*. Wherever we would introduce difference as an alleged addition, we always meet Existence and Being in their difference -----Existence and Being, each in its own way, are to be discovered through and in difference ... What we call difference we find everywhere and at all times in the object of thought, in Existence as such, and we come up against it in a manner so free of doubt that we do not pay any particular attention to it-----What is the meaning of this oft-mentioned Being? If under these conditions Being exhibits itself as a being

of..., in the genitive of difference, then the question just asked would be more to the point if rephrased: What in your opinion is difference if both Being as well as Existence each in their own way appear *through difference*}...

What is at stake is really the object of thought more objectively considered... In other words, it is Being thought of as emerging from difference _____

What we are now primarily concerned with in our undertaking is gaining an insight into the possibility of thinking of difference as an issue which is to clarify in how far the onto-theological constitution of metaphysics derives its original essence from the issue which we meet at the beginning of the history of metaphysics, runs through its periods and yet remains everywhere hidden, and hence forgotten, as the issue in an oblivion which escapes even us.

Heterology

Georges Bataille

Georges Bataille, an independent scholar who never held an academic position, played an important role in the development of Post-Structuralist thinking. His interest in anthropology, especially in the seminal work of Marcel Mauss, *The Gift* (1925), inspired him to develop the concept of an economy based on "expenditure without reserve" (without holding back or return). Post-Structuralists like Derrida found in this concept a prefiguration of their own notions of an excess of differential relations that overruns the bounds of meaning and truth. Bataille was also interested in liminal experiences where a culture's homogeneous interior met, was repelled by, and expelled an exterior that was heterogeneous. Usually, that outside was conceived as being a realm of madness, sexual excess, and non-utilitarian and wasteful behavior. Bataille noticed a curious affinity between the "waste" of a culture and the "sacred," since both are considered to be purely exterior to normal life. The following selection was written in 1930, but much of Bataille's important work, such as *The Cursed Share* (1949) and *Eroticism* (1957), was written later.

Appropriation and Excretion

1 The division of social facts into religious facts (prohibitions, obligations, and the realization of sacred action) on the one hand and profane facts (civil, political, juridical, industrial, and commercial organization) on the other, even though it is not easily applied to primitive societies and lends itself in general to a certain number of confusions, can nevertheless serve as the basis for the determination of two polarized human impulses: EXCRETION and APPROPRIATION....

The process of appropriation is characterized by a homogeneity (static equilibrium) of the author of the appropriation, and of objects as final result, whereas excretion presents itself as the result of a heterogeneity, and can move in the direction of an ever greater heterogeneity, liberating impulses whose ambivalence is more and more pronounced. The latter case is represented by, for example, sacrificial consumption in the elementary form of the orgy, which has no other goal than the incorporation in the person of irreducibly heterogeneous elements, insofar as such elements risk provoking an increase of force (or more exactly an increase of *mana*).... 4 Man does not only appropriate his food, but also the different products of his activity: clothes, furniture, dwellings, and instruments of production. Finally, he appropriates land divided into parcels. Such appropriations take place by means of a more or less conventional homogeneity (identity) established between the possessor

and the object possessed. It involves sometimes a personal homogeneity that in primitive times could only be solemnly destroyed with the aid of an excretory rite, and sometimes a general homogeneity, such as that established by the architect between a city and its inhabitants.

In this respect, production can be seen as the excretory phase of a process of appropriation, and the same is true of selling.

5 The homogeneity of the kind realized in cities between men and that which surrounds them is only a subsidiary form of a much more consistent homogeneity, which man has established throughout the external world by everywhere replacing *a priori* inconceivable objects with classified series of conceptions or ideas. The identification of all the elements of which the world is composed has been pursued with a constant obstinacy, so that scientific conceptions, as well as the popular conceptions of the world, seem to have voluntarily led to a representation as different from what could have been imagined *a priori* as the public square of a capital is from a region of high mountains.

This last appropriation - the work of philosophy as well as of science or common sense - has included phases of revolt and scandal, but it has always had as its goal the establishment of the homogeneity of the world, and it will only be able to lead to a terminal phase in the sense of excretion when the irreducible waste products of the operation are determined.

Philosophy, Religion, and Poetry in Relation to Heterology

6 The interest of philosophy resides in the fact that, in opposition to science or common sense, it must positively envisage the waste products of intellectual appropriation. Nevertheless, it most often envisages these waste products only in abstract forms of totality (nothingness, infinity, the absolute), to which it itself cannot give a positive content; it can thus freely proceed in speculations that more or less have as a goal, all things considered, the *sufficient* identification of an endless world with a finite world, an unknowable (noumenal) world with the known world.

Only an intellectual elaboration in a religious form can, in its periods of autonomous development, put forward the waste products of appropriative thought as the definitively heterogeneous (sacred) object of speculation _____

Religion thus differs from a practical and theoretical *heterology* (even though both are equally concerned with sacred or excremental facts), not only in that the former excludes the scientific rigor proper to the latter (which generally appears as different from religion as chemistry is from alchemy), but also in that, under normal conditions, it betrays the needs that it was not only supposed to regulate, but satisfy-----

The Heterological Theory of Knowledge

9 When one says that heterology scientifically considers questions of heterogeneity, one does not mean that heterology is, in the usual sense of such a formula, the science of the heterogeneous. The heterogeneous is even resolutely placed outside the reach of scientific knowledge, which by definition is only applicable to homogeneous elements. Above all, heterology is opposed to any homogeneous representation of the world, in other words, to any philosophical system. The goal of such represen-

tations is always the deprivation of our universe's sources of excitation and the development of a servile human species, fit only for the fabrication, rational consumption, and conservation of products. But the intellectual process automatically limits itself by producing of its own accord its own waste products, thus liberating in a disordered way the heterogeneous excremental element. Heterology is restricted to taking up again, consciously and resolutely, this terminal process which up until now has been seen as the abortion and the shame of human thought.

In that way it [heterology] leads to the complete reversal of the philosophical process, which ceases to be the instrument of appropriation, and now serves excretion; it introduces the demand for the violent gratifications implied by social life.

10 Only, on the one hand, the process of limitation and, on the other, the study of the violently alternating reactions of antagonism (expulsion) and love (reabsorption) obtained by positing the heterogeneous element, lie within the province of heterology as science. This element itself remains indefinable and can only be determined through negation. The specific character of fecal matter or of the specter, as well as of unlimited time or space, can only be the object of a series of negations, such as the absence of any possible common denominator, irrationality, etc. It must even be added that there is no way of placing such elements in the immediate objective human domain, in the sense that the pure and simple objectification of their specific character would lead to their incorporation in a homogeneous intellectual system, in other words, to a hypocritical cancellation of the excremental character —

As soon as the effort at rational comprehension ends in contradiction, the practice of intellectual scatology requires the excretion of unassimilable elements, which is another way of stating vulgarly that a burst of laughter is the only imaginable and definitively terminal result - and not the means - of philosophical speculation. And then one must indicate that a reaction as *insignificant* as a burst of laughter derives from the extremely vague and distant character of the intellectual domain, and that it suffices to go from a speculation resting on abstract facts to a practice whose mechanism is not different, but which immediately reaches concrete heterogeneity, in order to arrive at ecstatic trances and orgasm.

Principles of Practical Heterology

13 Excretion is not simply a middle term between two appropriations, just as decay is not simply a middle term between the grain and the ear of wheat. The inability to consider in this latter case decay as an end in itself is the result not precisely of the human viewpoint but of the specifically intellectual viewpoint (to the extent that this viewpoint is in practice subordinate to a process of appropriation) _____

[I]t is necessary to posit the limits of science's inherent tendencies and to constitute a knowledge of the *non-explainable, difference*, which supposes the immediate access of the intellect to a body of material prior to any intellectual reduction. Tentatively, it is enough to present the facts according to their nature and, with a view to defining the term *heterogeneous*, to introduce the following considerations:

- 1 Just as, in religious sociology, *mana* and *taboo* designate forms restricted to the particular applications of a more general form, the *sacred*, so may the *sacred* itself be considered as a restricted form of the *heterogeneous*...

- 2 Beyond the properly sacred things that constitute the common realm of religion or magic, the *heterogeneous* world includes everything resulting from *unproductive* expenditure² (sacred things themselves form part of this whole). This consists of everything rejected by *homogeneous* society as waste or as superior transcendent value. Included are the waste products of the human body and certain analogous matter (trash, vermin, etc.); the parts of the body; persons, words, or acts having a suggestive erotic value; the various unconscious processes such as dreams or neuroses; the numerous elements or social forms that *homogeneous* society is powerless to assimilate: mobs, the warrior, aristocratic and impoverished classes, different types of violent individuals or at least those who refuse the rule (madmen, leaders, poets, etc.);
- 3 Depending upon the person *heterogeneous* elements will provoke affective reactions of varying intensity, and it is possible to assume that the object of any affective reaction is necessarily *heterogeneous* (if not generally, at least with regard to the subject). There is sometimes attraction, sometimes repulsion, and in certain circumstances, any object of repulsion can become an object of attraction and vice versa;
- 4 *Violence, excess, delirium, madness* characterize heterogeneous elements to varying degrees: active, as persons or mobs, they result from breaking the laws of social *homogeneity*. This characteristic does not appropriately apply to inert objects, yet the latter do present a certain conformity with extreme emotions (if it is possible to speak of the violent and excessive nature of a decomposing body);
- 5 The reality of *heterogeneous* elements is not of the same order as that of *homogeneous* elements. *Homogeneous* reality presents itself with the abstract and neutral aspect of strictly defined and identified objects (basically, it is the specific reality of solid objects). *Heterogeneous* reality is that of a force or shock. It presents itself as a charge, as a value, passing from one object to another in a more or less abstract fashion, almost as if the change were taking place not in the world of objects but only in the judgments of the subject. The preceding aspect nevertheless does not signify that the observed facts are to be considered as subjective: thus, the action of the objects of erotic activity is manifestly rooted in their objective nature. Nonetheless, in a disconcerting way, the subject does have the capacity to displace the exciting value of one element onto an analogous or neighboring one. In heterogeneous reality, the symbols charged with affective value thus have the same importance as the fundamental elements, and the part can have the same value as the whole. It is easy to note that, since the structure of knowledge for a *homogeneous* reality is that of science, the knowledge of a *heterogeneous* reality as such is to be found in the mystical thinking of primitives and in dreams: it is identical to the structure of the *unconscious*.
- 6 In summary, compared to everyday life, *heterogeneous* existence can be represented as something *other*, as *incommensurate*, by charging these words with the *positive* value they have in *affective* experience.

Notes

- 1 The science of what is completely other. The term *agiology* would perhaps be more precise, but one would have to catch the double meaning of *agio* (analogous to the double meaning of *sacer*, *soiled* as well as *holy*). But it is above all the term *scatology* (the science of excrement) that retains in the present circumstances (the specialization of the sacred) an incontestable expressive value as the doublet of an abstract term such as *heterology*.
- 2 Cf. G. Bataille, "La notion de dépense," in *La Critique sociale* 7 (January 1933), p. 302.

- 3 It appears that the displacements are produced under the same conditions as are Pavlov's conditioned reflexes.
- 4 On the primitive mind, cf. Levy-Bruhl, *La Mentalite primitive*; Cassirer, *Das mythische Denken*; on the unconscious, cf. Freud, *The Interpretation of Dreams*.

Differance

Jacques Derrida

In his 1968 essay, "Differance," Derrida describes the process of spatial and temporal movement that he claims makes all thought and all reality possible. To justify it, he draws on the work of Saussure, Heidegger, and Nietzsche. He also alludes to the work of the pre-Socratic philosophers such as Anaximander.

Saussure argued that there is no substance in language. All language consists of differences. In language there are only forms, not substances, and by that he meant that all apparently substantive units of language are generated by other things that lie outside them, but these external characteristics are actually internal to their make-up. A "form" is something external that shapes material into a particular identity or substance. All elements of language have identity only in so much as they are produced by a network of differences, and each element will itself consist of further differentiations, endlessly.

Derrida contends that thought and our perception of reality are governed by similar processes. Traditional philosophy held that we see actual presences and substances in the world and that our ideas have presence and substance that guarantees their truthfulness. Derrida set about demonstrating that ideas especially are like units of language; they are generated by difference; they have no substance apart from the networks of differences (each bearing the traces of other elements and other differences) that generate them as effects. But of course, as in language, those processes that generate them do not have a palpable or graspable presence of their own. Like forms, they are empty, nonpresent, and nonsubstantive.

In this essay, he uses two axes to talk about the work of difference that produces presence as an effect that the mind then mistakenly assumes is a substance that guarantees truthfulness. The first is time. When we think of anything, we cannot grasp it in the "present moment," because that present moment is always passing away. Presence is shadowed by the death of presence, its shuttling past the mind into the oblivion of the past. Similarly, any current present moment bears in it the future present moments toward which it is moving. The differences between these "presents" constitute the "present" we attempt to grasp as something substantive before our minds. The second axis is space, and the same process of difference haunts the idea of a spatially determinate identity of presence. Any spatially locatable object of thought or idea has an identity or presence of its own only by differing from other things.

Another term for this operation of difference that shadows presence is "trace." All ideas and all objects of thought and perception bear the trace of other things, other moments, other "presences." To bear the trace of other things is to be shadowed by "alterity," which literally means "otherness."

Derrida concludes this essay by evoking the pre-Socratic notion of the "sumplokē" or "confluence of being." What the concept of differance leads to is a sense that everything in existence is relationally connected. We can sort it out into parts, but we should not assume those parts are pure and original or that they are pure identities. They are the effects of other processes of relation and differentiation. Derrida will elsewhere argue that what this means is that all things are signs and that all reality is "textual," in that all parts refer to or signify other parts, which are themselves signifiers of other parts. If we bear in mind the traditional definition of writing as the sign of a sign (the written sign of mental speech), then all reality is in a sense *graphic*, a form of writing. At the origin of thought is not a purely present idea but rather what Derrida calls "archi-writing," and by that he means the process he here describes as the spatio-temporal movement of "differance."

Derrida brings Saussure's notion of difference to bear on philosophical concepts. Like signs in language, he argues, they too are given identity by their differences from one another. He famously notes that philosophical oppositions such as the intelligible and the sensible, nature and culture, the ideal and physical, etc. can be shown to be produced by differance. Many literary critics have mistakenly limited deconstruction to this "undoing of binary opposition," but the questioning of oppositions is only one part of Derrida's undertaking, which aims to put in question the values and assumptions of the metaphysical philosophical tradition.

The verb "to differ" [*differer*] seems to differ from itself. On the one hand, it indicates difference as distinction, inequality, or discernibility; on the other, it expresses the interposition of delay, the interval of a *spacing* and *temporalizing* that puts off until "later" what is presently denied, the possible that is presently impossible. Sometimes the *different* and sometimes the *deferred* correspond [in French] to the verb "to differ." This correlation, however, is not simply one between act and object, cause and effect, or primordial and derived.

In the one case "to differ" signifies nonidentity; in the other case it signifies the order of the *same*. Yet there must be a common, although entirely differant [*differ-ante*] root within the sphere that relates the two movements of differing to one another. We provisionally give the name *differance* to this *sameness* which is not *identical*: by the silent writing of its *a*, it has the desired advantage of referring to differing, *both* as spacing/temporalizing and as the movement that structures every dissociation.

As distinct from difference, differance thus points out the irreducibility of temporalizing (which is also temporalization - in transcendental language which is no longer adequate here, this would be called the constitution of primordial temporality — just as the term "spacing" also includes the constitution of primordial spatiality). Differance is not simply active (any more than it is a subjective accomplishment); it rather indicates the middle voice, it precedes and sets up the opposition between passivity and activity. With its *a*, differance more properly refers to what in classical language would be called the origin or production of differences and the differences between differences, the *play* [*jeu*] of differences. Its locus and operation will therefore be seen wherever speech appeals to difference.

Differance is neither a *word* nor a *concept*. In it, however, we shall see the juncture rather than the summation - of what has been most decisively inscribed in the thought of what is conveniently called our "epoch": the difference of forces in Nietzsche, Saussure's principle of semiological difference, differing as the possibility of [neurone] facilitation, impression and delayed effect in Freud, difference as the irreducibility of the trace of the other in Levinas, and the ontic-ontological difference

in Heidegger. Reflection on this last determination of difference will lead us to consider difference as the *strategic* note or connection - relatively or provisionally *privileged* - which indicates the closure of presence, together with the closure of the conceptual order and denomination, a closure that is effected in the functioning of traces.

I SHALL SPEAK, THEN, OF A LETTER - the first one, if we are to believe the alphabet and most of the speculations that have concerned themselves with it.

I shall speak then of the letter *a*, this first letter which it seemed necessary to introduce now and then in writing the word "difference." This seemed necessary in the course of writing about writing, and of writing within a writing whose different strokes all pass, in certain respects, through a gross spelling mistake, through a violation of the rules governing writing, violating the law that governs writing and regulates its conventions of propriety. In fact or theory we can always erase or lessen this spelling mistake, and, in each case, while these are analytically different from one another but for practical purposes the same, find it grave, unseemly, or, indeed, supposing the greatest ingenuousness, amusing. Whether or not we care to quietly overlook this infraction, the attention we give it beforehand will allow us to recognize, as though prescribed by some mute irony, the inaudible but displaced character of this literal permutation. We can always act as though this makes no difference. I must say from the start that my account serves less to justify this silent spelling mistake, or still less to excuse it, than to aggravate its obtrusive character.

On the other hand, I must be excused if I refer, at least implicitly, to one or another of the texts that I have ventured to publish. Precisely what I would like to attempt to some extent (although this is in principle and in its highest degree impossible, due to essential *de jure* reasons) is to bring together an *assemblage* of the different ways I have been able to utilize - or, rather, have allowed to be imposed on me - what I will provisionally call the word or concept of difference in its new spelling. It is literally neither a word nor a concept, as we shall see. I insist on the word "assemblage" here for two reasons: on the one hand, it is not a matter of describing a history, of recounting the steps, text by text, context by context, each time showing which scheme has been able to impose this graphic disorder, although this could have been done as well; rather, we are concerned with the *general system of all these schemata*. On the other hand, the word "assemblage" seems more apt for suggesting that the kind of bringing together proposed here has the structure of an interlacing, a weaving, or a web, which would allow the different threads and different lines of sense or force to separate again, as well as being ready to bind others together.

In a quite preliminary way, we now recall that this particular graphic intervention was conceived in the writing-up of a question about writing; it was not made simply to shock the reader or grammarian. Now, in point of fact, it happens that this graphic difference (the *a* instead of the *e*), this marked difference between two apparently vocalic notations, between vowels, remains purely graphic: it is written or read, but it is not heard. It cannot be heard, and we shall see in what respects it is also beyond the order of understanding. It is put forward by a silent mark, by a tacit monument, or, one might even say, by a pyramid - keeping in mind not only the capital form of the printed letter but also that passage from Hegel's *Encyclopaedia* where he compares the body of the sign to an Egyptian pyramid. The *a* of difference, therefore, is not heard; it remains silent, secret, and discreet, like a tomb.

It is a tomb that (provided one knows how to decipher its legend) is not far from signaling the death of the king.

It is a tomb that cannot even be made to resonate. For I cannot even let you know, by my talk, now being spoken before the Societe Francaise de Philosophic, which difference I am talking about at the very moment I speak of it. I can only talk about this graphic difference by keeping to a very indirect speech about writing, and on the condition that I specify each time that I am referring to difference with an *e* or difference with an *a*. All of which is not going to simplify matters today, and will give us all a great deal of trouble when we want to understand one another. In any event, when I do specify which difference I mean - when I say "with an *e*" or "with an <z" - this will refer irreducibly to a *written text*, a text governing my talk, a text that I keep in front of me, that I will read, and toward which I shall have to try to lead your hands and eyes. We cannot refrain here from going by way of a written text, from ordering ourselves by the disorder that is produced therein - and this is what matters to me first of all.

Doubtless this pyramidal silence of the graphic difference between the *e* and the *a* can function only within the system of phonetic writing and within a language or grammar historically tied to phonetic writing and to the whole culture which is inseparable from it. But I will say that it is just this - this silence that functions only within what is called phonetic writing - that points out or reminds us in a very opportune way that, contrary to an enormous prejudice, there is no phonetic writing. There is no purely and strictly phonetic writing. What is called phonetic writing can only function - in principle and *de jure*, and not due to some factual and technical inadequacy - by incorporating nonphonetic "signs" (punctuation, spacing, etc.); but when we examine their structure and necessity, we will quickly see that they are ill described by the concept of signs. Saussure had only to remind us that the play of difference was the functional condition, the condition of possibility, for every sign; and it is itself silent. The difference between two phonemes, which enables them to exist and to operate, is inaudible. The inaudible opens the two present phonemes to hearing, as they present themselves. If, then, there is no purely phonetic writing, it is because there is no purely phonetic phone. The difference that brings out phonemes and lets them be heard and understood [*entendre*] itself remains inaudible.

It will perhaps be objected that, for the same reasons, the graphic difference itself sinks into darkness, that it never constitutes the fullness of a sensible term, but draws out an invisible connection, the mark of an inapparent relation between two spectacles. That is no doubt true. Indeed, since from this point of view the difference between the *e* and the *a* marked in "difference" eludes vision and hearing, this happily suggests that we must here let ourselves be referred to an order that no longer refers to sensibility. But we are not referred to intelligibility either, to an ideality not fortuitously associated with the objectivity of *theorem* or understanding. We must be referred to an order, then, that resists philosophy's founding opposition between the sensible and the intelligible. The order that resists this opposition, that resists it because it sustains it, is designated in a movement of difference (with an *a*) between two differences or between two letters. This difference belongs neither to the voice nor to writing in the ordinary sense, and it takes place, like the strange space that will assemble us here for the course of an hour, *between* speech and writing and beyond the tranquil familiarity that binds us to one and to the other, reassuring us sometimes in the illusion that they are two separate things.

Now, HOW AM I TO SPEAK OF the *a* of difference? It is clear that it cannot be *exposed*. We can expose only what, at a certain moment, can become *present*, manifest; what can be shown, presented as a present, a being-present in its truth, the truth of a present or the presence of a present. However, if difference is (I also cross out the "is") what makes the presentation of being-present possible, it never presents itself as such. It is never given in the present or to anyone. Holding back and not exposing itself, it goes beyond the order of truth on this specific point and in this determined way, yet is not itself concealed, as if it were something, a mysterious being, in the occult zone of a nonknowing. Any exposition would expose it to disappearing as a disappearance. It would risk appearing, thus disappearing.

Thus, the detours, phrases, and syntax that I shall often have to resort to will resemble - will sometimes be practically indiscernible from - those of negative theology. Already we had to note that difference is *not*, does not exist, and is not any sort of being-present (*on*). And we will have to point out everything that it *is not*, and, consequently, that it has neither existence nor essence. It belongs to no category of being, present or absent. And yet what is thus denoted as difference is not theological, not even in the most negative order of negative theology. The latter, as we know, is always occupied with letting a supraessential reality go beyond the finite categories of essence and existence, that is, of presence, and always hastens to remind us that, if we deny the predicate of existence to God, it is in order to recognize him as a superior, inconceivable, and ineffable mode of being. Here there is no question of such a move, as will be confirmed as we go along. Not only is difference irreducible to every ontological or theological - onto-theological - reappropriation, but it opens up the very space in which onto-theology - philosophy - produces its system and its history. It thus encompasses and irrevocably surpasses onto-theology or philosophy.

For the same reason, I do not know where to begin to mark out this assemblage, this graph, of difference. Precisely what is in question here is the requirement that there be a *de jure* commencement, an absolute point of departure, a responsibility arising from a principle. The problem of writing opens by questioning the *arche*. Thus what I put forth here will not be developed simply as a philosophical discourse that operates on the basis of a principle, of postulates, axioms, and definitions and that moves according to the discursive line of a rational order. In marking out difference, everything is a matter of strategy and risk. It is a question of strategy because no transcendent truth present outside the sphere of writing can theologically command the totality of this field. It is hazardous because this strategy is not simply one in the sense that we say that strategy orients the tactics according to a final aim, a *telos* or the theme of a domination, a mastery or an ultimate reappropriation of movement and field. In the end, it is a strategy without finality. We might call it blind tactics or empirical errance, if the value of empiricism did not itself derive all its meaning from its opposition to philosophical responsibility. If there is a certain errance in the tracing-out of difference, it no longer follows the line of logico-philosophical speech or that of its integral and symmetrical opposite, logico-empirical speech. The concept of *play* \jeu\ remains beyond this opposition; on the eve and aftermath of philosophy, it designates the unity of chance and necessity in an endless calculus.

By decision and, as it were, by the rules of the game, then, turning this thought around, let us introduce ourselves to the thought of difference by way of the theme

of strategy or stratagem. By this merely strategic justification, I want to emphasize that the efficacy of this thematics of differance very well may, and even one day must, be sublated, i.e., lend itself, if not to its own replacement, at least to its involvement in a series of events which in fact it never commanded. This also means that it is not a theological thematics.

I will say, first of all, that differance, which is neither a word nor a concept, seemed to me to be strategically the theme most proper to think out, if not master (thought being here, perhaps, held in a certain necessary relation with the structural limits of mastery), in what is most characteristic of our "epoch." I start off, then, strategically, from the place and time in which "we" are, even though my opening is not justifiable in the final account, and though it is always on the basis of differance and its "history" that we can claim to know who and where "we" are and what the limits of an "epoch" can be.

Although "differance" is neither a word nor a concept, let us nonetheless attempt a simple and approximative semantic analysis which will bring us in view of what is at stake [*en vue de l'enjeu*]. We do know that the verb "to differ" [*differer*] (the Latin verb *differre*) has two seemingly quite distinct meanings; in the *Littre* dictionary, for example, they are the subject of two separate articles. In this sense, the Latin *differre* is not the simple translation of the Greek *diapherein*; this fact will not be without consequence for us in tying our discussion to a particular language, one that passes for being less philosophical, less primordially philosophical, than the other. For the distribution of sense in the Greek *diapherein* does not carry one of the two themes of the Latin *differre*, namely, the action of postponing until later, of taking into account, the taking-account of time and forces in an operation that implies an economic reckoning, a detour, a respite, a delay, a reserve, a representation - all the concepts that I will sum up here in a word I have never used but which could be added to this series: *temporalizing*. "To differ" in this sense is to temporalize, to resort, consciously or unconsciously, to the temporal and temporalizing mediation of a detour that suspends the accomplishment or fulfillment of "desire" or "will," or carries desire or will out in a way that annuls or tempers their effect. We shall see, later, in what respects this temporalizing is also a temporalization and spacing, is space's becoming-temporal and time's becoming-spatial, is "primordial constitution" of space and time, as metaphysics or transcendental phenomenology would call it in the language that is here criticized and displaced.

The other sense of "to differ" [*differer*] is the most common and most identifiable, the sense of not being identical, of being other, of being discernible, etc. And in "differents," whether referring to the alterity of dissimilarity or the alterity of allergy or of polemics, it is necessary that interval, distance, *spacing* occur among the different elements and occur actively, dynamically, and with a certain perseverance in repetition.

But the word "difference" (with an *e*) could never refer to differing as temporalizing or to difference as *polemos*. It is this loss of sense that the word differance (with an *a*) will have to schematically compensate for. Differance can refer to the whole complex of its meanings at once, for it is immediately and irreducibly multivalent, something which will be important for the discourse I am trying to develop. It refers to this whole complex of meanings not only when it is supported by a language or interpretive context (like any signification), but it already does so somehow of itself. Or at least it does so more easily by itself than does any other word: here the *a* comes

more immediately from the present participle [*differant*] and brings us closer to the action of "differing" that is in progress, even before it has produced the effect that is constituted as different or resulted in difference (with an *e*). Within a conceptual system and in terms of classical requirements, difference could be said to designate the productive and primordial constituting causality, the process of scission and division whose differings and differences would be the constituted products or effects. But while bringing us closer to the infinitive and active core of differing, "difference" with an *a* neutralizes what the infinitive denotes as simply active, in the same way that "parlance" does not signify the simple fact of speaking, of speaking to or being spoken to. Nor is resonance the act of resonating. Here in the usage of our language we must consider that the ending *-ance* is undecided between active and passive. And we shall see why what is designated by "difference" is neither simply active nor simply passive, that it announces or rather recalls something like the middle voice, that it speaks of an operation which is not an operation, which cannot be thought of either as a passion or as an action of a subject upon an object, as starting from an agent or from a patient, or on the basis of, or in view of, any of these *terms*. But philosophy has perhaps commenced by distributing the middle voice, expressing a certain intransitiveness, into the active and the passive voice, and has itself been constituted in this repression.

How are difference as temporalizing and difference as spacing conjoined?

Let us begin with the problem of signs and writing - since we are already in the midst of it. We ordinarily say that a sign is put in place of the thing itself, the present thing - "thing" holding here for the sense as well as the referent. Signs represent the present in its absence; they take the place of the present. When we cannot take hold of or show the thing, let us say the present, the being-present, when the present does not present itself, then we signify, we go through the detour of signs. We take up or give signs; we make signs. The sign would thus be a deferred presence. Whether it is a question of verbal or written signs, monetary signs, electoral delegates, or political representatives, the movement of signs defers the moment of encountering the thing itself, the moment at which we could lay hold of it, consume or expend it, touch it, see it, have a present intuition of it. What I am describing here is the structure of signs as classically determined, in order to define -through a commonplace characterization of its traits - signification as the difference of temporalizing. Now this classical determination presupposes that the sign (which defers presence) is conceivable only *on the basis of* the presence that it defers and *in view of* the deferred presence one intends to reappropriate. Following this classical semiology, the substitution of the sign for the thing itself is both *secondary* and *provisional*: it is second in order after an original and lost presence, a presence from which the sign would be derived. It is provisional with respect to this final and missing presence, in view of which the sign would serve as a movement of mediation.

In attempting to examine these secondary and provisional aspects of the substitute, we shall no doubt catch sight of something like a primordial difference. Yet we could no longer even call it primordial or final, inasmuch as the characteristics of origin, beginning, *telos*, *eschaton*, etc., have always denoted presence - *ousia*, *parousia*, etc. To question the secondary and provisional character of the sign, to oppose it to a "primordial" difference, would thus have the following consequences:

1 Difference can no longer be understood according to the concept of "sign," which has always been taken to mean the representation of a presence and has been

constituted in a system (of thought or language) determined on the basis of and in view of presence.

2 In this way we question the authority of presence or its simple symmetrical contrary, absence or lack. We thus interrogate the limit that has always constrained us, that always constrains us - we who inhabit a language and a system of thought - to form the meaning of being in general as presence or absence, in the categories of being or beingness (*ousia*). It already appears that the kind of questioning we are thus led back to is, let us say, the Heideggerian kind, and that differance *seems* to lead us back to the ontic-ontological difference. But permit me to postpone this reference. I shall only note that between differance as temporalizing-temporalization (which we can no longer conceive within the horizon of the present) and what Heidegger says about temporalization in *Sein und Zeit* (namely, that as the transcendental horizon of the question of being it must be freed from the traditional and metaphysical domination by the present or the now) - between these two there is a close, if not exhaustive and irreducibly necessary, interconnection.

But first of all, let us remain with the semiological aspects of the problem to see how differance as temporalizing is conjoined with differance as spacing. Most of the semiological or linguistic research currently dominating the field of thought (whether due to the results of its own investigations or due to its role as a generally recognized regulative model) traces its genealogy, rightly or wrongly, to Saussure as its common founder. It was Saussure who first of all set forth the *arbitrariness of signs* and the *differential character* of signs as principles of general semiology and particularly of linguistics. And, as we know, these two themes - the arbitrary and the differential - are in his view inseparable. Arbitrariness can occur only because the system of signs is constituted by the differences between the terms, and not by their fullness. The elements of signification function not by virtue of the compact force of their cores but by the network of oppositions that distinguish them and relate them to one another. "Arbitrary and differential" says Saussure "are two correlative qualities."

As the condition for signification, this principle of difference affects the *whole sign*, that is, both the signified and the signifying aspects. The signified aspect is the concept, the ideal sense. The signifying aspect is what Saussure calls the material or physical (e.g., acoustical) "image." We do not here have to enter into all the problems these definitions pose. Let us only cite Saussure where it interests us:

The conceptual side of value is made up solely of relations and differences with respect to the other terms of language, and the same can be said of its material side ____ Every thing that has been said up to this point boils down to this: in language there are only differences. Even more important: a difference generally implies positive terms between which the difference is set up; but in language there are only differences *without positive terms*. Whether we take the signified or the signifier, language has neither ideas nor sounds that existed before the linguistic system, but only conceptual and phonic differences that have issued from the system. The idea or phonic substance that a sign contains is of less importance than the other signs that surround it.

The first consequence to be drawn from this is that the signified concept is never present in itself, in an adequate presence that would refer only to itself. Every concept is necessarily and essentially inscribed in a chain or a system, within which it refers to another and to other concepts, by the systematic play of differences. Such a play, then - difference - is no longer simply a concept, but the possibility of

conceptuality, of the conceptual system and process in general. For the same reason, difference, which is not a concept, is not a mere word; that is, it is not what we represent to ourselves as the calm and present self-referential unity of a concept and sound [*phonie*]. We shall later discuss the consequences of this for the notion of a word.

The difference that Saussure speaks about, therefore, is neither itself a concept nor one word among others. We can say this *a fortiori* for difference. Thus we are brought to make the relation between the one and the other explicit.

Within a language, within the *system* of language, there are only differences. A taxonomic operation can accordingly undertake its systematic, statistical, and classificatory inventory. But, on the one hand, these differences *play a role* in language, in speech as well, and in the exchange between language and speech. On the other hand, these differences are themselves *effects*. They have not fallen from the sky ready made; they are no more inscribed in a *topos noetos* than they are prescribed in the wax of the brain. If the word "History" did not carry with it the theme of a final repression of difference, we could say that differences alone could be "historical" through and through and from the start.

What we note as *difference* will thus be the movement of play that "produces" (and not by something that is simply an activity) these differences, these effects of difference. This does not mean that the difference which produces differences is before them in a simple and in itself unmodified and indifferent present. Difference is the nonfull, nonsimple "origin"; it is the structured and differing origin of differences.

Since language (which Saussure says is a classification) has not fallen from the sky, it is clear that the differences have been produced; they are the effects produced, but effects that do not have as their cause a subject or substance, a thing in general, or a being that is somewhere present and itself escapes the play of difference. If such a presence were implied (quite classically) in the general concept of cause, we would therefore have to talk about an effect without a cause, something that would very quickly lead to no longer talking about effects. I have tried to indicate a way out of the closure imposed by this system, namely, by means of the "trace." No more an effect than a cause, the "trace" cannot of itself, taken outside its context, suffice to bring about the required transgression.

As there is no presence before the semiological difference or outside it, we can extend what Saussure writes about language to signs in general: "Language is necessary in order for speech to be intelligible and to produce all of its effects; but the latter is necessary in order for language to be established; historically, the fact of speech always comes first."

Retaining at least the schema, if not the content, of the demand formulated by Saussure, we shall designate by the term *difference* the movement by which language, or any code, any system of reference in general, becomes "historically" constituted as a fabric of differences. Here, the terms "constituted," "produced," "created," "movement," "historically," etc., with all they imply, are not to be understood only in terms of the language of metaphysics, from which they are taken. It would have to be shown why the concepts of production, like those of constitution and history, remain accessories in this respect to what is here being questioned; this, however, would draw us too far away today, toward the theory of the representation of the "circle" in which we seem to be enclosed. I only use these terms here, like many

other concepts, out of strategic convenience and in order to prepare the deconstruction of the system they form at the point which is now most decisive. In any event, we will have understood, by virtue of the very circle we appear to be caught up in, that differance, as it is written here, is no more static than genetic, no more structural than historical. Nor is it any less so. And it is completely to miss the point of this orthographical impropriety to want to object to it on the basis of the oldest of metaphysical oppositions - for example, by opposing some generative point of view to a structuralist-taxonomic point of view, or conversely. These oppositions do not pertain in the least to differance; and this, no doubt, is what makes thinking about it difficult and uncomfortable.

If we now consider the chain to which "differance" gets subjected, according to the context, to a certain number of nonsynonymic substitutions, one will ask why we resorted to such concepts as "reserve," "protowriting," "prototrace," "spacing," indeed to "supplement" or "*pharmakon*" and, before long, to "hymen," etc.

Let us begin again. Differance is what makes the movement of signification possible only if each element that is said to be "present," appearing on the stage of presence, is related to something other than itself but retains the mark of a past element and already lets itself be hollowed out by the mark of its relation to a future element. This trace relates no less to what is called the future than to what is called the past, and it constitutes what is called the present by this very relation to what it is not, to what it absolutely is not; that is, not even to a past or future considered as a modified present. In order for it to be, an interval must separate it from what it is not; but the interval that constitutes it in the present must also, and by the same token, divide the present in itself, thus dividing, along with the present, everything that can be conceived on its basis, that is, every being - in particular, for our metaphysical language, the substance or subject. Constituting itself, dynamically dividing itself, this interval is what could be called *spacing*; time's becoming-spatial or space's becoming-temporal (*temporalizing*). And it is this constitution of the present as a "primordial" and irreducibly nonsimple, and, therefore, in the strict sense non-primordial, synthesis of traces, retentions, and protentions (to reproduce here, analogically and provisionally, a phenomenological and transcendental language that will presently be revealed as inadequate) that I propose to call protowriting, prototrace, or differance. The latter (is) (both) spacing (and) temporalizing.

Given this (active) movement of the (production of) differance without origin, could we not, quite simply and without any neographism, call it *differentiation*? Among other confusions, such a word would suggest some organic unity, some primordial and homogeneous unity, that would eventually come to be divided up and take on difference as an event. Above all, formed on the verb "to differentiate," this word would annul the economic signification of detour, temporalizing delay, "deferring." I owe a remark in passing to a recent reading of one of Koyre's texts entitled "Hegel at Jena." In that text, Koyre cites long passages from the Jena *Logic* in German and gives his own translation. On two occasions in Hegel's text he encounters the expression "*differente Beziehung*." This word (*different*), whose root is Latin, is extremely rare in German and also, I believe, in Hegel, who instead uses *verschie-den* or *ungleich*, calling difference *Unterschied* and qualitative variety *Verschiedenheit*. In the Jena *Logic*, he uses the word *different* precisely at the point where he deals with time and the present. Before coming to Koyre's valuable remark, here are some passages from Hegel, as rendered by Koyre:

The infinite, in this simplicity is - as a moment opposed to the self-identical - the negative. In its moments, while the infinite presents the totality to (itself) and in itself, (it is) excluding in general, the point or limit; but in this, its own (action of) negating, it relates itself immediately to the other and negates itself. The limit or moment of the present (*der Gegenwart*), the absolute "this" of time or the now, is an absolutely negative simplicity absolutely excluding all multiplicity from itself, and by this very fact is absolutely determined; it is not an extended whole or *quantum* within itself (and) which would in itself also have an undetermined aspect or qualitative variety, which of itself would be related, indifferently (*gleichgultig*) or externally to another but on the contrary, this is an absolutely different relation of the simple.

And Koyre specifies in a striking note: "Different relation *different* Beziehung. We could say: differentiating relation." And on the following page, from another text of Hegel, we can read: "*Diese Beziehung ist Gegenwart, als eine differente Beziehung*" (This relation is [the] present, as a different relation). There is another note by Koyre: "The term '*different*' is taken here in an active sense."

Writing "differing" or "differance" (with an *a*) would have had the utility of making it possible to translate Hegel on precisely this point with no further qualifications - and it is a quite decisive point in his text. The translation would be, as it always should be, the transformation of one language by another. Naturally, I maintain that the word "differance" can be used in other ways, too; first of all, because it denotes not only the activity of primordial difference but also the temporalizing detour of deferring. It has, however, an even more important usage. Despite the very profound affinities that differance thus written has with Hegelian speech (as it should be read), it can, at a certain point, not exactly break with it, but rather work a sort of displacement with regard to it. A definite rupture with Hegelian language would make no sense, nor would it be at all likely; but this displacement is both infinitesimal and radical. I have tried to indicate the extent of this displacement elsewhere; it would be difficult to talk about it with any brevity at this point.

Differences are thus "produced" - differed — by differance. But *what* differs, or *who* differs? In other words, *what is* differance? With this question we attain another stage and another source of the problem.

What differs? Who differs? What is differance?

If we answered these questions even before examining them as questions, even before going back over them and questioning their form (even what seems to be most natural and necessary about them), we would fall below the level we have now reached. For if we accepted the form of the question in its own sense and syntax ("What?," "What is?," "Who is?"), we would have to admit that differance is derived, supervenient, controlled, and ordered from the starting point of a being-present, one capable of being something, a force, a state, or power in the world, to which we could give all kinds of names: a *what*, or being-present as a *subject*, a *who*. In the latter case, notably, we would implicitly admit that the being-present (for example, as a self-present being or consciousness) would eventually result in differing: in delaying or in diverting the fulfillment of a "need" or "desire," or in differing from itself. But in none of these cases would such a being-present be "constituted" by this differance.

Now if we once again refer to the semiological difference, what was it that Saussure in particular reminded us of? That "language [which consists only of differences] is not a function of the speaking subject." This implies that the subject (self-identical or even conscious of self-identity, self-conscious) is inscribed in the

language, that he is a "function" of the language. He becomes a *speaking* subject only by conforming his speech - even in the aforesaid "creation," even in the aforesaid "transgression" - to the system of linguistic prescriptions taken as the system of differences, or at least to the general law of differance, by conforming to that law of language which Saussure calls "language without speech." "Language is necessary for the spoken word to be intelligible and so that it can produce all of its effects."

If, by hypothesis, we maintain the strict opposition between speech and language, then differance will be not only the play of differences within the language but the relation of speech to language, the detour by which I must also pass in order to speak, the silent token I must give, which holds just as well for linguistics in the strict sense as it does for general semiology; it dictates all the relations between usage and the formal schema, between the message and the particular code, etc. Elsewhere I have tried to suggest that this differance within language, and in the relation between speech and language, forbids the essential dissociation between speech and writing that Saussure, in keeping with tradition, wanted to draw at another level of his presentation. The use of language or the employment of any code which implies a play of forms - with no determined or invariable substratum - also presupposes a retention and protention of differences, a spacing and temporalizing, a play of traces. This play must be a sort of inscription prior to writing, a protowriting without a present origin, without an *arc he*. From this comes the systematic crossing-out of the *arche* and the transformation of general semiology into a grammatology, the latter performing a critical work upon everything within semiology - right down to its matricial concept of signs - that retains any metaphysical presuppositions incompatible with the theme of differance.

We might be tempted by an objection: to be sure, the subject becomes a *speaking* subject only by dealing with the system of linguistic differences; or again, he becomes a *signifying* subject (generally by speech or other signs) only by entering into the system of differences. In this sense, certainly, the speaking or signifying subject would not be self-present, insofar as he speaks or signifies, except for the play of linguistic or semiological differance. But can we not conceive of a presence and self-presence of the subject before speech or its signs, a subject's self-presence in a silent and intuitive consciousness?

Such a question therefore supposes that prior to signs and outside them, and excluding every trace and differance, something such as consciousness is possible. It supposes, moreover, that, even before the distribution of its signs in space and in the world, consciousness can gather itself up in its own presence. What then is consciousness? What does "consciousness" mean? Most often in the very form of "meaning" [*"vouloir dire"*], consciousness in all its modifications is conceivable only as self-presence, a self-perception of presence. And what holds for consciousness also holds here for what is called subjective existence in general. Just as the category of subject is not and never has been conceivable without reference to presence as *hypokeimenon* or *ousia*, etc., so the subject as consciousness has never been able to be evinced otherwise than as self-presence. The privilege accorded to consciousness thus means a privilege accorded to the present; and even if the transcendental temporality of consciousness is described in depth, as Husserl described it, the power of synthesis and of the incessant gathering-up of traces is always accorded to the "living present."

This privilege is the ether of metaphysics, the very element of our thought insofar as it is caught up in the language of metaphysics. We can only de-limit such a closure

today by evoking this import of presence, which Heidegger has shown to be the onto-theological determination of being. Therefore, in evoking this import of presence, by an examination which would have to be of a quite peculiar nature, we question the absolute privilege of this form or epoch of presence in general, that is, consciousness as meaning [*vouloir dire*] in self-presence.

We thus come to posit presence - and, in particular, consciousness, the being-next-to-itself consciousness - no longer as the absolutely matrical form of being but as a "determination" and an "effect." Presence is a determination and effect within a system which is no longer that of presence but that of difference; it no more allows the opposition between activity and passivity than that between cause and effect or indetermination and determination, etc. This system is of such a kind that even to designate consciousness as an effect or determination - for strategic reasons, reasons that can be more or less clearly considered and systematically ascertained - is to continue to operate according to the vocabulary of that very thing to be delimited.

Before being so radically and expressly Heideggerian, this was also Nietzsche's and Freud's move, both of whom, as we know, and often in a very similar way, questioned the self-assured certitude of consciousness. And is it not remarkable that both of them did this by starting out with the theme of difference?

This theme appears almost literally in their work, at the most crucial places. I shall not expand on this here; I shall only recall that for Nietzsche "the important main activity is unconscious" and that consciousness is the effect of forces whose essence, ways, and modalities are not peculiar to it. Now force itself is never present; it is only a play of differences and quantities. There would be no force in general without the difference between forces; and here the difference in quantity counts more than the content of quantity, more than the absolute magnitude itself.

Quantity itself therefore is not separable from the difference in quantity. The difference in quantity is the essence of force, the relation of force with force. To fancy two equal forces, even if we grant them opposing directions, is an approximate and crude illusion, a statistical dream in which life is immersed, but which chemistry dispels.

Is not the whole thought of Nietzsche a critique of philosophy as active indifference to difference, as a system of reduction or adaphoristic repression? Following the same logic - logic itself - this does not exclude the fact that philosophy lives *in* and *from* difference, that it thereby blinds itself to the *same*, which is not the identical. The same is precisely difference (with an *a*), as the diverted and equivocal passage from one difference to another, from one term of the opposition to the other. We could thus take up all the coupled oppositions on which philosophy is constructed, and from which our language lives, not in order to see opposition vanish but to see the emergence of a necessity such that one of the terms appears as the difference of the other, the other as "differed" within the systematic ordering of the same (e.g., the intelligible as differing from the sensible, as sensible differed; the concept as differed-differing intuition, life as differing-differed matter; mind as differed-differing life; culture as differed-differing nature; and all the terms designating what is other than *physis* - *techne*, *nomos*, society, freedom, history, spirit, etc. - as *physis* differed or *physis* differing; *physis in difference*). It is out of the unfolding of this "same" as difference that the sameness of difference and of repetition is presented in the eternal return.

In Nietzsche, these are so many themes that can be related with the kind of symptomatology that always serves to diagnose the evasions and ruses of anything disguised in its difference. Or again, these terms can be related with the entire thematics of active interpretation, which substitutes an incessant deciphering for the disclosure of truth as a presentation of the thing itself in its presence, etc. What results is a cipher without truth, or at least a system of ciphers that is not dominated by truth value, which only then becomes a function that is understood, inscribed, and circumscribed.

We shall therefore call difference this "active" (in movement) discord of the different forces and of the differences between forces which Nietzsche opposes to the entire system of metaphysical grammar, wherever that system controls culture, philosophy, and science.

It is historically significant that this diaphoristics, understood as an energetics or an economy of forces, set up to question the primacy of presence qua consciousness, is also the major theme of Freud's thought; in his work we find another diaphoristics, both in the form of a theory of ciphers or traces and an energetics. The questioning of the authority of consciousness is first and always differential.

The two apparently different meanings of difference are tied together in Freudian theory: differing [*le differer*] as discernibility, distinction, deviation, diastem, *spacing*; and deferring [*le differer*] as detour, delay, relay, reserve, *temporalizing*. I shall recall only that:

1 The concept of trace (*Spur*), of facilitation (*Bahnung*), of forces of facilitation are, as early as the composition of the *Entwurf* inseparable from the concept of difference. The origin of memory and of the psyche as a memory in general (conscious or unconscious) can only be described by taking into account the difference between the facilitation thresholds, as Freud says explicitly. There is no facilitation [*Bahnung*] without difference and no difference without a trace.

2 All the differences involved in the production of unconscious traces and in the process of inscription (*Niederschrift*) can also be interpreted as moments of difference, in the sense of "placing on reserve." Following a schema that continually guides Freud's thinking, the movement of the trace is described as an effort of life to protect itself by *deferring* the dangerous investment, by constituting a reserve (*Vorrat*). And all the conceptual oppositions that furrow Freudian thought relate each concept to the other like movements of a detour, within the economy of difference. The one is only the other deferred, the one differing from the other. The one is the other in difference, the one is the difference from the other. Every apparently rigorous and irreducible opposition (for example that between the secondary and primary) is thus said to be, at one time or another, a "theoretical fiction." In this way again, for example (but such an example covers everything or communicates with everything), the difference between the pleasure principle and the reality principle is only difference as detour (*Aufschieben*, *Aufschub*). In *Beyond the Pleasure Principle*, Freud writes

Under the influence of the ego's instincts of self-preservation, the pleasure principle is replaced by the reality principle. This latter principle does not abandon the intention of ultimately obtaining pleasure, but it nevertheless demands and carries into effect the postponement of satisfaction, the abandonment of a number of possibilities of gaining satisfaction and the temporary toleration of unpleasure as a step on the long indirect road (*Aufschub*) to pleasure.

Here we touch on the point of greatest obscurity, on the very enigma of differance, on how the concept we have of it is divided by a strange separation. We must not hasten to make a decision too quickly. How can we conceive of differance as a systematic detour which, within the element of the same, always aims at either finding again the pleasure or the presence that had been deferred by (conscious or unconscious) calculation, and, *at the same time*, how can we, on the other hand, conceive of differance as the relation to an impossible presence as an expenditure without reserve, as an irreparable loss of presence, an irreversible wearing-down of energy, or indeed as a death instinct and a relation to the absolutely other that apparently breaks up any economy? It is evident - it is evidence itself - that system and nonsystem, the same and the absolutely other, etc., cannot be conceived *together*.

If differance is this inconceivable factor, must we not perhaps hasten to make it evident, to bring it into the philosophical element of evidence, and thus quickly dissipate its mirage character and illogicality, dissipate it with the infallibility of the calculus we know well - since we have recognized its place, necessity, and function within the structure of differance? What would be accounted for philosophically here has already been taken into account in the system of differance as it is here being calculated. I have tried elsewhere, in a reading of Bataille,¹ to indicate what might be the establishment of a rigorous, and in a new sense "scientific," *relating* of a "restricted economy" - one having nothing to do with an unreserved expenditure, with death, with being exposed to nonsense, etc. - to a "general economy" or system that, so to speak, *takes account of* what is unreserved. It is a relation between a differance that is accounted for and a differance that fails to be accounted for, where the establishment of a pure presence, without loss, is one with the occurrence of absolute loss, with death. By establishing this relation between a restricted and a general system, we shift and recommence the very project of philosophy under the privileged heading of Hegelianism.

The economic character of differance in no way implies that the deferred presence can always be recovered, that it simply amounts to an investment that only temporarily and without loss delays the presentation of presence, that is, the perception of gain or the gain of perception. Contrary to the metaphysical, dialectical, and "Hegelian" interpretation of the economic movement of differance, we must admit a game where whoever loses wins and where one wins and loses each time. If the diverted presentation continues to be somehow definitively and irreducibly withheld, this is not because a particular present remains hidden or absent, but because differance holds us in a relation with what exceeds (though we necessarily fail to recognize this) the alternative of presence or absence. A certain alterity - Freud gives it a metaphysical name, the unconscious - is definitively taken away from every process of presentation in which we would demand for it to be shown forth in person. In this context and under this heading, the unconscious is not, as we know, a hidden, virtual, and potential self-presence. It is differed — which no doubt means that it is woven out of differences, but also that it sends out, that it delegates, representatives or proxies; but there is no chance that the mandating subject "exists" somewhere, that it is present or is "itself," and still less chance that it will become conscious. In this sense, contrary to the terms of an old debate, strongly symptomatic of the metaphysical investments it has always assumed, the "unconscious" can no more be classed as a "thing" than as anything else; it is no more of a thing than an implicit or masked consciousness. This radical alterity, removed from every possible mode of presence, is characterized by irreducible after-

effects, by delayed effects. In order to describe them, in order to read the traces of the "unconscious" traces (there are no "conscious" traces), the language of presence or absence, the metaphysical speech of phenomenology, is in principle inadequate.

The structure of delay (*retardement: Nachtraglichkeit*) that Freud talks about indeed prohibits our taking temporalization (temporalizing) to be a simple dialectical complication of the present; rather, this is the style of transcendental phenomenology. It describes the living present as a primordial and incessant synthesis that is constantly led back upon itself, back upon its assembled and assembling self, by retentional traces and protentional openings. With the alterity of the "unconscious," we have to deal not with the horizons of modified presents - past or future - but with a "past" that has never been nor will ever be present, whose "future" will never be produced or reproduced in the form of presence. The concept of trace is therefore incommensurate with that of retention, that of the becoming-past of what had been present. The trace cannot be conceived - nor, therefore, can differance - on the basis of either the present or the presence of the present.

A past that has never been present: with this formula Emmanuel Levinas designates (in ways that are, to be sure, not those of psychoanalysis) the trace and the enigma of absolute alterity, that is, the Other [*autrui*]. At least within these limits, and from this point of view, the thought of differance implies the whole critique of classical ontology undertaken by Levinas. And the concept of trace, like that of differance, forms - across these different traces and through these differences between traces, as understood by Nietzsche, Freud, and Levinas (these "authors' names" serve only as indications) - the network that sums up and permeates our "epoch" as the de-limitation of ontology (of presence).

The ontology of presence is the ontology of beings and beingness. Everywhere, the dominance of beings is solicited by differance - in the sense that *sollicitare* means, in old Latin, to shake all over, to make the whole tremble. What is questioned by the thought of differance, therefore, is the determination of being in presence, or in beingness. Such a question could not arise and be understood without the difference between Being and beings opening up somewhere. The first consequence of this is that differance is not. It is not a being-present, however excellent, unique, principal, or transcendent one makes it. It commands nothing, rules over nothing, and nowhere does it exercise any authority. It is not marked by a capital letter. Not only is there no realm of differance, but differance is even the subversion of every realm. This is obviously what makes it threatening and necessarily dreaded by everything in us that desires a realm, the past or future presence of a realm. And it is always in the name of a realm that, believing one sees it ascend to the capital letter, one can reproach it for wanting to rule.

Does this mean, then, that differance finds its place within the spread of the ontic-ontological difference, as it is conceived, as the "epoch" conceives itself within it, and particularly "across" the Heideggerian meditation, which cannot be gotten around?

There is no simple answer to such a question.

In one particular respect, differance is, to be sure, but the historical and epochal *deployment* of Being or of the ontological difference. The *a* of differance marks the *movement* of this deployment.

And yet, is not the thought that conceives the *meaning* or *truth* of Being, the determination of differance as ontic-ontological difference - difference conceived

within the horizon of the question of *Being* - still an intrametaphysical effect of difference? Perhaps the deployment of difference is not only the truth or the epochality of Being. Perhaps we must try to think this *unheard-of* thought, this silent tracing, namely, that the history of Being (the thought of which is committed to the Greco-Western logos), as it is itself produced across the ontological difference, is only one epoch of the *diapherein*. Then we could no longer even call it an "epoch," for the concept of epochality belongs within history understood as the history of Being. Being has always made "sense," has always been conceived or spoken of as such, only by dissimulating itself in beings; thus, in a particular and very strange way, difference (is) "older" than the ontological difference or the truth of Being. In this age it can be called the play of traces. It is a trace that no longer belongs to the horizon of Being but one whose sense of Being is borne and bound by this play; it is a play of traces or difference that has no meaning and is not, a play that does not belong. There is no support to be found and no depth to be had for this bottomless chessboard where being is set in play.

It is perhaps in this way that the Heraclitean play of the *hen diapheron heautoi*, of the one differing from itself, of what is in difference with itself, already becomes lost as a trace in determining the *diapherein* as ontological difference.

To think through the ontological difference doubtless remains a difficult task, a task whose statement has remained nearly inaudible. And to prepare ourselves for venturing beyond our own logos, that is, for a difference so violent that it refuses to be stopped and examined as the epochality of Being and ontological difference, is neither to give up this passage through the truth of Being, nor is it in any way to "criticize," "contest," or fail to recognize the incessant necessity for it. On the contrary, we must stay within the difficulty of this passage; we must repeat this passage in a rigorous reading of metaphysics, wherever metaphysics serves as the norm of Western speech, and not only in the texts of "the history of philosophy." Here we must allow the trace of whatever goes beyond the truth of Being to appear/ disappear in its fully rigorous way. It is a trace of something that can never present itself; it is itself a trace that can never be presented, that is, can never appear and manifest itself as such in its phenomenon. It is a trace that lies beyond what profoundly ties fundamental ontology to phenomenology. Like difference, the trace is never presented as such. In presenting itself it becomes effaced; in being sounded it dies away, like the writing of the *a*, inscribing its pyramid in difference.

We can always reveal the precursive and secretive traces of this movement in metaphysical speech, especially in the contemporary talk about the closure of ontology, i.e., through the various attempts we have looked at (Nietzsche, Freud, Levinas) - and particularly in Heidegger's work.

The latter provokes us to question the essence of the present, the presence of the present.

What is the present? What is it to conceive the present in its presence?

Let us consider, for example, the 1946 text entitled "Der Spruch des Anaximander." Heidegger there recalls that the forgetting of Being forgets about the difference between Being and beings:

But the point of Being (*die Sache des Seins*) is to be the Being of beings. The linguistic form of this enigmatic and multivalent genitive designates a genesis (*Genesis*), a provenance (*Herkunft*) of the *present* from presence (*des Anwesenden aus dem Anwesen*). But with

the unfolding of these two, the essence (*Wesen*) of this provenance remains hidden (*verborgen*). Not only is the essence of this provenance not thought out, but neither is the simple relation between presence and present (*Anwesen und Anwesenden*).

Since the dawn, it seems that presence and being-present are each separately something. Imperceptibly, presence becomes itself a present.... The essence of presence (*Das Wesen des Anwesens*), and thus the difference between presence and present, is forgotten. *The forgetting of Being is the forgetting of the difference between Being and beings.*¹⁵

In recalling the difference between Being and beings (the ontological difference) as the difference between presence and present, Heidegger puts forward a proposition, indeed, a group of propositions; it is not our intention here to idly or hastily "criticize" them but rather to convey them with all their provocative force.

Let us then proceed slowly. What Heidegger wants to point out is that the difference between Being and beings, forgotten by metaphysics, has disappeared without leaving a trace. The very trace of difference has sunk from sight. If we admit that difference (is) (itself) something other than presence and absence, if it *traces*, then we are dealing with the forgetting of the difference (between Being and beings), and we now have to talk about a disappearance of the trace's trace. This is certainly what this passage from "Der Spruch des Anaximander" seems to imply:

The forgetting of Being is a part of the very essence of Being, and is concealed by it. The forgetting belongs so essentially to the destination of Being that the dawn of this destination begins precisely as an unconcealment of the *present* in its *presence*. This means: the history of Being begins by the forgetting of Being, in that Being retains its essence, its difference from beings. Difference is wanting; it remains forgotten. Only what is differentiated - the present and presence (*das Anwesende und das Anwesen*) - becomes uncovered, but not *insofar as* it is differentiated. On the contrary, the matinal trace (*die friihe Spur*) of difference effaces itself from the moment that presence appears as a being-present (*das Anwesen und ein Anwesendes erscheint*) and finds its provenance in a supreme (being)-present (*in einem hbchsten Anwesenden*)¹⁶

The trace is not a presence but is rather the simulacrum of a presence that dislocates, displaces, and refers beyond itself. The trace has, properly speaking, no place, for effacement belongs to the very structure of the trace. Effacement must always be able to overtake the trace; otherwise it would not be a trace but an indestructible and monumental substance. In addition, and from the start, effacement constitutes it as a trace - effacement establishes the trace in a change of place and makes it disappear in its appearing, makes it issue forth from itself in its very position. The effacing of this early trace (*die friihe Spur*) of difference is therefore "the same" as its tracing within the text of metaphysics. This metaphysical text must have retained a mark of what it lost or put in reserve, set aside. In the language of metaphysics the paradox of such a structure is the inversion of the metaphysical concept which produces the following effect: the present becomes the sign of signs, the trace of traces. It is no longer what every reference refers to in the last instance; it becomes a function in a generalized referential structure. It is a trace, and a trace of the effacement of a trace.

In this way the metaphysical text is *understood*; it is still readable, and remains to be read. It proposes both the monument and the mirage of the trace, the trace as simultaneously traced and effaced, simultaneously alive and dead, alive as always to simulate even life in its preserved inscription; it is a pyramid.

Thus we think through, without contradiction, or at least without granting any pertinence to such contradiction, what is perceptible and imperceptible about the trace. The "matinal trace" of difference is lost in an irretrievable invisibility, and yet even its loss is covered, preserved, regarded, and retarded. This happens in a text, in the form of presence.

Having spoken about the effacement of the matinal trace, Heidegger can thus, in this contradiction without contradiction, consign or countersign the sealing of the trace. We read on a little further:

The difference between Being and beings, however, can in turn be experienced as something forgotten only if it is already discovered with the presence of the present (*mit dem Anwesen des Anwesenden*) and if it is thus sealed in a trace (*so eine Spur geprägt hat*) that remains preserved (*gewahrt bleibt*) in the language which Being appropriates.

Further on still, while meditating upon Anaximander's $\omega \chi \rho \epsilon \& \nu$, translated as *Brauch* (sustaining use), Heidegger writes the following:

Dispensing accord and deference (*Fug und Ruck verfügend*), our sustaining use frees the present (*das Anwesende*) in its sojourn and sets it free every time for its sojourn. But by the same token the present is equally seen to be exposed to the constant danger of hardening in the insistence (*in das blosse Beharren verhartet*) out of its sojourning duration. In this way sustaining use (*Brauch*) remains itself and at the same time an abandonment (*Aushändigung*: handing-over) of presence (*des Anwesens*) in den Un-fug, to discord (dis-jointedness). Sustaining use joins together the dis- (*Der Brauch fügt das Un-*).

And it is at the point where Heidegger determines *sustaining use* as *trace* that the question must be asked: can we, and how far can we, think of this trace and the *dis*-of difference as *Wesen des Seins*? Doesn't the *dis* of difference refer us beyond the history of Being, beyond our language as well, and beyond everything that can be named by it? Doesn't it call for - in the language of being - the necessarily violent transformation of this language by an entirely different language?

Let us be more precise here. In order to dislodge the "trace" from its cover (and whoever believes that one tracks down some *thing*; one tracks down tracks), let us continue reading this passage:

The translation of $\omega \chi \rho \epsilon \alpha$, "sustaining use" (*Brauch*) does not derive from cogitations of an etymologico-lexical nature. The choice of the word "sustaining use" derives from an antecedent translation (*Übersetzen*) of the thought that attempts to conceive difference in the deployment of Being (*im Wesen des Seins*) toward the historical beginning of the forgetting of Being. The word "sustaining use" is dictated to thought in the apprehension (*Erfahrung*) of the forgetting of Being, $\omega \chi \rho \tau \iota \nu$, properly names a trace (*Spur*) of what remains to be conceived in the word "sustaining use," a trace that quickly disappears (*alsbald verschwindet*) into the history of Being, in its world-historical unfolding as Western metaphysics.

How do we conceive of the outside of a text? How, for example, do we conceive of what stands opposed to the text of Western metaphysics? To be sure, the "trace that quickly disappears into the history of Being,... as Western metaphysics," escapes all

the determinations, all the names it might receive in the metaphysical text. The trace is sheltered and thus dissimulated in these names; it does not appear in the text as the trace "itself." But this is because the trace itself could never itself appear as such. Heidegger also says that difference can never appear *as such*: "Lichtung des Unterschiedes kann deshalb auch nicht bedeuten, dass der Unterschied als der Unterschied erscheint." There is no essence of difference; not only can it not allow itself to be taken up into the *as such* of its name or its appearing, but it threatens the authority of the *as such* in general, the thing's presence in its essence. That there is no essence of difference at this point also implies that there is neither Being nor truth to the play of writing, *insofar as* it involves difference.

For us, difference remains a metaphysical name; and all the names that it receives from our language are still, so far as they are names, metaphysical. This is particularly so when they speak of determining difference as the difference between presence and present (*Anwesen/Anwesend*), but already and especially so when, in the most general way, they speak of determining difference as the difference between Being and beings. "Older" than Being itself, our language has no name for such a difference. But we "already know" that if it is unnameable, this is not simply provisional; it is not because our language has still not found or received this *name*, or because we would have to look for it in another language, outside the finite system of our language. It is because there is no *name* for this, not even essence or Being - not even the name "difference," which is not a name, which is not a pure nominal unity, and continually breaks up in a chain of different substitutions.

"There is no name for this": we read this as a truism. What is unnameable here is not some ineffable being that cannot be approached by a name; like God, for example. What is unnameable is the play that brings about the nominal effects, the relatively unitary or atomic structures we call names, or chains of substitutions for names. In these, for example, the nominal effect of "difference" is itself involved, carried off, and reinscribed, just as the false beginning or end of a game is still part of the game, a function of the system.

What we do know, what we could know if it were simply a question of knowing, is that there never has been and never will be a unique word, a master name. This is why thinking about the letter *a* of difference is not the primary prescription, nor is it the prophetic announcement of some imminent and still unheard-of designation. There is nothing kerygmatic about this "word" so long as we can perceive its reduction to a lower-case letter.

There will be no unique name, not even the name of Being. It must be conceived without *nostalgia*; that is, it must be conceived outside the myth of the purely maternal or paternal language belonging to the lost fatherland of thought. On the contrary, we must *affirm* it - in the sense that Nietzsche brings affirmation into play - with a certain laughter and with a certain dance.

After this laughter and dance, after this affirmation that is foreign to any dialectic, the question arises as to the other side of nostalgia, which I will call Heideggerian *hope*. I am not unaware that this term may be somewhat shocking. I venture it all the same, without excluding any of its implications, and shall relate it to what seems to me to be retained of metaphysics in "Der Spruch des Anaximander," namely, the quest for the proper word and the unique name. In talking about the "first word of Being" (*dasfruhe Wort des Seins: TO xpetuz/*), Heidegger writes,

The relation to the present, unfolding its order in the very essence of *presence*, is unique (*ist eine einzige*). It is pre-eminently incomparable to any other relation; it belongs to the uniqueness of Being itself (*Sie gehört zur Einzigkeit des Seins selbst*). Thus, in order to name what is deployed in Being (*das Wesende des Seins*), language will have to find a single word, the unique word (*ein einziges, das einzige Wort*). There we see how hazardous is every word of thought (every thoughtful word: *denkende Wort*) that addresses itself to Being (*das dem Sein zugesprochen wird*). What is hazarded here, however, is not something impossible, because Being speaks through every language; everywhere and always.²⁰

Such is the question: the marriage between speech and Being in the unique word, in the finally proper name. Such is the question that enters into the affirmation put into play by difference. The question bears (upon) each of the words in this sentence: "Being / speaks / through every language; / everywhere and always /."

Notes

- 1 This essay appeared originally in the *Bulletin de la Société française de philosophie*, LXII, No. 3 (July-September, 1968), pp. 73-101. Derrida's remarks were delivered as a lecture at a meeting of the Société at the Sorbonne, in the Amphithéâtre Michelet, on January 27, 1968, with Jean Wahl presiding. Professor Wahl's introductory and closing remarks have not been translated. The essay was reprinted in *Théorie d'ensemble*, a collection of essays by Derrida and others, published by Editions Seuil in 1968. It is reproduced here by permission of Editions Seuil.

Of Grammatology

Jacques Derrida

Of Grammatology (1967) is a polemic against the metaphysical tradition in philosophy from Plato to Husserl. That tradition sought a basis for determining truth in the operations of the mind or *logos*. The mind's ability to grasp the presence of an object or of an idea was the gold standard of truthfulness. In this "logocentric" conception of truth, objects and ideas were conceived as being substances and presences that could exist apart from difference and supplementarity. The techniques of signification especially were considered alien to the presence of ideas. Mere "re-presentation" in language was an artificial supplement to and a substitute for ideas but was not itself a bearer of authentic presence or ideational substance. Derrida notices that this assumption is necessarily phonological and phonocentric. It associates the ability of the mind to grasp pure ideas with mental speech and the voice of consciousness. The mind's ability to hear itself speak and think is closely associated with the metaphysical notion that ideas transcend the ordinary empirical world of language and signification. In this tradition, the external contrivances and techniques of signification in language, writing especially, have to be added onto mental speech and to ideal meaning if it is to be communicated. But according to metaphysics such supplementary addition is alien to the purely ideal quality of thought and of mental speech, which is purely expressive of the living immediacy of presence.

Derrida's critique of this tradition notices that writing in the metaphysical tradition is a recurring delinquent. It more than any other form of signification is associated with the loss of presence and with untruth. Writing is a signifier of a signifier, the graphic sign of mental speech, itself a sign of ideas. As such, it is doubly removed from true ideas in consciousness. It represents the twin dangers of difference and alterity (or otherness) because it depends on something else or "other" to be "itself." As such, it is the perfect embodiment of the concept of the differential constitution of identity. Derrida examines those texts in the metaphysical tradition that discuss the origin of language and notices that the origin of language is described as a moment of presence that is prior to all signification. Writing, especially, is characterized as alien to presence because it is merely "supplementary," an addition to presence in the mind as rendered in mental speech. Derrida finds that when writers like Rousseau describe an origin of language that is supposedly a pure natural presence prior to signification and to writing, what they describe instead is difference. Derrida calls this version of difference "proto-" or "archi-writing" because difference and writing are two names for the same structure of supplementation whereby the identity of one term requires reference to and supplementation by an-other to be itself. One cannot isolate presence from difference or the identity of presence from differential relations that necessarily and in an essential way contaminate it with the characteristics of writing. If everything is differential, then everything is, like writing, a signifier

of a signifies To be "itself," it must refer to "others" which are themselves referential or differential.

Logocentric metaphysics consistently banishes writing as a defective addition to presence, but when one reads metaphysical texts in a deconstructive manner, what one finds is that writing (as a metaphor for difference) is the precondition of presence. Presence cannot exist outside of a structure of supplementary and signification, a network of differential relations between terms that permit identities to form. Yet, as Derrida notes, ideas cannot elude spatialization. If they are to be expressed in language, they must contain the potential to be re-presented within them. They must be capable of differing from themselves and assuming another form that doubles them and re-presents their presence. Derrida contends this is the case because they are already doubled within themselves. The process of difference, the network of signification which makes meaning possible by differentially linking signifying elements, allows ideas to come into being in the first place, but what this means is that each single element is in its very constitution doubled. It is both "itself" and its "others," a double rather than a singular thing. Rather than be an external feature added on to the identity of individual ideas, the doubling of difference produces and makes possible ideation in the first place. Ideas could not assume the form of external representation if the doubling that re-presentation represents did not inhabit ideas from the get go. And what this means is that a certain spatial relation - between a thing and its other(s) - inhabits all presence. Each presence is re-presented (by its others) in its essence, in its origin, and in "itself."

In this book, Derrida's method is most explicitly deconstructive in that he seems to use writers' texts against themselves. Whenever one examines how writers in the metaphysical tradition designate a moment of pure presence, he finds, they invariably have recourse to differentiations that situate presence within a network of relations between terms. They declare the priority of presence but describe the priority of difference. Saussure, for example, is loyal to the metaphysical tradition when he makes speech prior to and more central than writing. Yet his argument works in a way that undermines his own premises. He declares writing secondary, but in order to do so, he must begin by differentiating an inside from an outside, an inside of language that is speech from an outside that is the realm of writing and graphic notation. Yet this initial act of differentiation is never accounted for by Saussure. It begins his argument, but, like writing, it remains outside his thinking, like an empty supplement, both a danger to his thought and the remedy that makes his thought possible. In later works, Derrida will draw attention to the problematic nature of this "his" in "his thought." He will note that our thinking is made possible by processes of signification and by movements of difference that lie outside our subjective control. In so doing, he will shift focus away from the "logos" and from the idea that consciousness is central in the determination of truth. "To deconstruct" in some sense means to notice the a-logical, a-human processes that make our thinking possible while also making it other than what we think.

Some vocabulary:

"Phenomenon, phenomenology." The philosophy of Edmund Husserl was called phenomenology. A phenomenon is the idea of an object, its mental representation. Husserl was concerned with describing the operations of consciousness that would allow true ideas to be grasped by the mind.

"Epoch, epoche, epochal." Epoch (from the Greek word *epoche*) refers to Husserl's phenomenological reduction, whereby all contingent, worldly, empirical features of an object are separated out from the idea of that object so that the mind can grasp it as a pure idea. Another term for this operation is "bracketing" or putting out of play.

Derrida plays with "epoch" by using it to mean both the reduction of worldly contingency (eliminating signification from ideation, most notably) and the historical era in which metaphysics reigned from Plato down to Husserl.

"Logos" is the Greek word for mind or reason as well as language. Many philosophers in the metaphysical tradition tried to locate a basis for truth in the mind. Derrida suggests that such ideal truth is conceived by these philosophers as a substance or presence that the mind grasps in some pure way aloof from signification and especially from that secondary form of signification called writing. In the logos, the authority and reality of ideal truth is guaranteed by its link both to consciousness's ability to be aware of itself or present to itself and by its ability to hear itself speak. The "phonic" element of thought is thus linked to the ability of the logos to guarantee truth as presence in the mind. For this reason, Derrida here identifies "logocentrism" with "phonocentrism."

"Onto-theology" literally means "religion of being." "Ontos" is the Greek word for being, and being in this sense means the existence of things or the underlying fact of existence (i.e., that things exist at all instead of not existing). Such theology, according to Derrida, is characterized by the belief that being is a presence or a substance, rather than something which more resembles a computer screen in that it is generated as an effect by relations between different things each of whose identity is also differential, part of a network of relations. If Derrida's claim that "différance" underlies reality is the case, then reality as it appears in our minds, the "being" of things, is produced as an effect of spatial differences between things or between different moments in time. The presence of being is a "ghost effect" created by the fluttering past the screen of our minds of things with no identity of their own apart from their differences or relations. To believe that being is pure presence is therefore theological, an act of faith rather than an accurate perception. A related term is "ontico-ontological difference," a phrase from Martin Heidegger that refers to his idea that one must distinguish between the field of existing things (the ontic) and the basic fact of being (ontology).

"Aufhebung" and "Erinnerung." These two words from the German philosopher G. W. F. Hegel, a major metaphysical thinker, refer to the metaphysical belief that language gives expression to ideas that prior to that expression lead a purely spiritual existence in the mind. Ideation is not physical, according to the metaphysical philosophers; it exists in another realm from physical matter. Ideas that are expressed in signs in language merely bear spirit out of itself, but it then always returns to itself. That return is captured by the word "Erinnerung" which means "memory." Signs remember the spirit they bear in them, the ideal meaning they carry, according to Hegel.

"Aufhebung" means "sublimation," and it refers to the way ideas supposedly enter the exterior realm of signification and are then resurrected into spirit in the act of interpretation that finds meaning in the signs that bear ideas. According to this theory, when we communicate, ideas leave the realm of pure ideality in the mind, enter the external mechanisms of signification, and are then converted back into spirit when someone understands or interprets what is being communicated. Derrida points out that writing or signification has always had a dual meaning in the idealist tradition: on the one hand, it is a secondary addition to ideas that remembers them. It has meaning only in so much as it recalls the meaning or idea that animated it. On the other hand, writing represents the forgetting of the truth of mental speech or of ideas. It threatens ideas and mental speech with loss of meaning. He chooses "writing" as his primary metaphor for "différance" in *Of Grammatology* for this reason. It indicates the way all ideality and all ideal notions of truth are plagued by a necessity they cannot expel. Writing (différance) makes them possible yet at the same time is the instru-

ment for assuring the impossibility of the claim that ideas are purely ideal or are pure presences or substances in the mind.

"Trace" refers to the fact that all things (ideas, objects) that seem to have an identity are in fact constituted by their relations to or difference from other ideas and objects. They bear the "trace" of the other. Another name for such "otherness" is "alterity."

The End of the Book and the Beginning of Writing

Socrates, he who does not write — Nietzsche

However the topic is considered, the *problem of language* has never been simply one problem among others. But never as much as at present has it invaded, *as such*, the global horizon of the most diverse researches and the most heterogeneous discourses, diverse and heterogeneous in their intention, method, and ideology. The devaluation of the word "language" itself, and how, in the very hold it has upon us, it betrays a loose vocabulary, the temptation of a cheap seduction, the passive yielding to fashion, the consciousness of the avant-garde, in other words - ignorance - are evidences of this effect. This inflation of the sign "language" is the inflation of the sign itself, absolute inflation, inflation itself. Yet, by one of its aspects or shadows, it is itself still a sign: this crisis is also a symptom. It indicates, as if in spite of itself, that a historico-metaphysical epoch *must* finally determine as language the totality of its problematic horizon. It must do so not only because all that desire had wished to wrest from the play of language finds itself recaptured within that play but also because, for the same reason, language itself is menaced in its very life, helpless, adrift in the threat of limitlessness, brought back to its own finitude at the very moment when its limits seem to disappear, when it ceases to be self-assured, contained, and *guaranteed* by the infinite signified which seemed to exceed it.

The program

By a slow movement whose necessity is hardly perceptible, everything that for at least some twenty centuries tended toward and finally succeeded in being gathered under the name of language is beginning to let itself be transferred to, or at least summarized under, the name of writing. By a hardly perceptible necessity, it seems as though the concept of writing - no longer indicating a particular, derivative, auxiliary form of language in general (whether understood as communication, relation, expression, signification, constitution of meaning or thought, etc.), no longer designating the exterior surface, the insubstantial double of a major signifier, *the signifier of the signifier* - is beginning to go beyond the extension of language. In all senses of the word, writing thus *comprehends* language. Not that the word "writing" has ceased to designate the signifier of the signifier, but it appears, strange as it may

"Aus dem Gedankenkreise der Geburt der Tragödie," I. 3. *Nietzsche Werke* (Leipzig, 1903), vol. 9, part 2 i, p. 66.

seem, that "signifier of the signifier" no longer defines accidental doubling and fallen secondarity. "Signifier of the signifier" describes on the contrary the movement of language: in its origin, to be sure, but one can already suspect that an origin whose structure can be expressed as "signifier of the signifier" conceals and erases itself in its own production. There the signified always already functions as a signifier. The secondarity that it seemed possible to ascribe to writing alone affects all signifieds in general, affects them always already, the moment they *enter the game*. There is not a single signified that escapes, even if recaptured, the play of signifying references that constitute language. The advent of writing is the advent of this play; today such a play is coming into its own, effacing the limit starting from which one had thought to regulate the circulation of signs, drawing along with it all the reassuring signifieds, reducing all the strongholds, all the out-of-bounds shelters that watched over the field of language. This, strictly speaking, amounts to destroying the concept of "sign" and its entire logic. Undoubtedly it is not by chance that this *overwhelming* supervenes at the moment when the extension of the concept of language effaces all its limits. We shall see that this overwhelming and this effacement have the same meaning, are one and the same phenomenon. It is as if the Western concept of language (in terms of what, beyond its plurivocity and beyond the strict and problematic opposition of speech [*parole*] and language [*langue*], attaches it *in general* to phonematic or glossematic production, to language, to voice, to hearing, to sound and breath, to speech) were revealed today as the guise or disguise of a primary writing: more fundamental than that which, before this conversion, passed for the simple "supplement to the spoken word" (Rousseau). Either writing was never a simple "supplement," or it is urgently necessary to construct a new logic of the "supplement." It is this urgency which will guide us further in reading Rousseau.

These disguises are not historical contingencies that one might admire or regret. Their movement was absolutely necessary, with a necessity which cannot be judged by any other tribunal. The privilege of the *phone* does not depend upon a choice that could have been avoided. It responds to a moment of *economy* (let us say of the "life" of "history" or of "being as self-relationship"). The system of "hearing (understand-ing)-oneself-speak" through the phonic substance - which *presents itself as* the non-exterior, nonmundane, therefore nonempirical or noncontingent signifier - has necessarily dominated the history of the world during an entire epoch, and has even produced the idea of the world, the idea of world-origin, that arises from the difference between the worldly and the non-worldly, the outside and the inside, ideality and nonideality, universal and nonuniversal, transcendental and empirical, etc.

With an irregular and essentially precarious success, this movement would apparently have tended, as toward its *telos*, to confine writing to a secondary and instrumental function: translator of a full speech that was fully *present* (present to itself, to its signified, to the other, the very condition of the theme of presence in general), technics in the service of language, *spokesman*, interpreter of an originary speech itself shielded from interpretation.

Technics in the service of language: I am not invoking a general essence of technics which would be already familiar to us and would help us in *understanding* the narrow and historically determined concept of writing as an example. I believe on the contrary that a certain sort of question about the meaning and origin of writing precedes, or at least merges with, a certain type of question about the meaning and origin of technics. That is why the notion of technique can never simply clarify the notion of writing.

It is therefore as if what we call language could have been in its origin and in its end only a moment, an essential but determined mode, a phenomenon, an aspect, a species of writing. And as if it had succeeded in making us forget this, and *in wilfully misleading us*, only in the course of an adventure: as that adventure itself. All in all a short enough adventure. It merges with the history that has associated technics and logocentric metaphysics for nearly three millennia. And it now seems to be approaching what is really its own *exhaustion*: under the circumstances - and this is no more than one example among others - of this death of the civilization of the book, of which so much is said and which manifests itself particularly through a convulsive proliferation of libraries. All appearances to the contrary, this death of the book undoubtedly announces (and in a certain sense always has announced) nothing but a death of speech (of a *so-called* full speech) and a new mutation in the history of writing, in history as writing. Announces it at a distance of a few centuries. It is on that scale that we must reckon it here, being careful not to neglect the quality of a very heterogeneous historical duration: the acceleration is such, and such its qualitative meaning, that one would be equally wrong in making a careful evaluation according to past rhythms. "Death of speech" is of course a metaphor here: before we speak of disappearance, we must think of a new situation for speech, of its subordination within a structure of which it will no longer be the archon.

To affirm in this way that the concept of writing exceeds and comprehends that of language, presupposes of course a certain definition of language and of writing. If we do not attempt to justify it, we shall be giving in to the movement of inflation that we have just mentioned, which has also taken over the word "writing," and that not fortuitously. For some time now, as a matter of fact, here and there, by a gesture and for motives that are profoundly necessary, whose degradation is easier to denounce than it is to disclose their origin, one says "language" for action, movement, thought, reflection, consciousness, unconsciousness, experience, affectivity, etc. Now we tend to say "writing" for all that and more: to designate not only the physical gestures of literal pictographic or ideographic inscription, but also the totality of what makes it possible; and also, beyond the signifying side, the signified side itself. And thus we say "writing" for all that gives rise to an inscription in general, whether it is literal or not and even if what it distributes in space is alien to the order of the voice: cinematography, choreography, of course, but also pictorial, musical, sculptural "writing." One might also speak of athletic writing, and with even greater certainty of military or political writing in view of the techniques that govern those domains today. All this to describe not only the system of notation secondarily connected with these activities but the essence and the content of these activities themselves. It is also in this sense that the contemporary biologist speaks of writing and *pro-gram* in relation to the most elementary processes of information within the living cell. And, finally, whether it has essential limits or not, the entire field covered by the cybernetic *program* will be the field of writing. If the theory of cybernetics is by itself to oust all metaphysical concepts - including the concepts of soul, of life, of value, of choice, of memory - which until recently served to separate the machine from man, it must conserve the notion of writing, trace, gramme [written mark], or grapheme, until its own historico-metaphysical character is also exposed. Even before being determined as human (with all the distinctive characteristics that have always been attributed to man and the entire system of significations that they imply) or nonhuman, the *gramme* - or the *grapheme* - would thus name the element. An element without simplicity. An element, whether it

is understood as the medium or as the irreducible atom, of the arche-synthesis in general, of what one must forbid oneself to define within the system of oppositions of metaphysics, of what consequently one should not even call *experience* in general, that is to say the origin of *meaning* in general.

This situation has always already been announced. Why is it today in the process of making itself known *as such* and *after the fact*? This question would call forth an interminable analysis. Let us simply choose some points of departure in order to introduce the limited remarks to which I shall confine myself. I have already alluded to *theoretical* mathematics; its writing - whether understood as a sensible *graphie* [manner of writing] (and that already presupposes an identity, therefore an ideality, of its form, which in principle renders absurd the so easily admitted notion of the "sensible signifier"), or understood as the ideal synthesis of signifieds or a trace operative on another level, or whether it is understood, more profoundly, as the *passage* of the one to the other - has never been absolutely linked with a phonetic production. Within cultures practicing so-called phonetic writing, mathematics is not just an enclave. That is mentioned by all historians of writing; they recall at the same time the imperfections of alphabetic writing, which passed for so long as the most convenient and "the most intelligent"⁴ writing. This enclave is also the place where the practice of scientific language challenges intrinsically and with increasing profundity the ideal of phonetic writing and all its implicit metaphysics (metaphysics *itself*), particularly, that is, the philosophical idea of the *episteme*; also of *istoria*, a concept profoundly related to it in spite of the dissociation or opposition which has distinguished one from the other during one phase of their common progress. History and knowledge, *istoria* and *episteme* have always been determined (and not only etymologically or philosophically) as detours for the purpose of the reappropriation of presence.

But beyond theoretical mathematics, the development of the *practical methods* of information retrieval extends the possibilities of the "message" vastly, to the point where it is no longer the "written" translation of a language, the transporting of a signified which could remain spoken in its integrity. It goes hand in hand with an extension of phonography and of all the means of conserving the spoken language, of making it function without the presence of the speaking subject. This development, coupled with that of anthropology and of the history of writing, teaches us that phonetic writing, the medium of the great metaphysical, scientific, technical, and economic adventure of the West, is limited in space and time and limits itself even as it is in the process of imposing its laws upon the cultural areas that had escaped it. But this nonfortuitous conjunction of cybernetics and the "human sciences" of writing leads to a more profound reversal.

The signifier and truth

The "rationality" - but perhaps that word should be abandoned for reasons that will appear at the end of this sentence - which governs a writing thus enlarged and radicalized, no longer issues from a *logos*. Further, it inaugurates the destruction, not the demolition but the de-sedimentation, the de-construction, of all the significations that have their source in that of the *logos*. Particularly the signification of *truth*. All the metaphysical determinations of truth, and even the one beyond metaphysical ontology that Heidegger reminds us of, are more or less immediately inseparable

from the instance of the logos, or of a reason thought within the lineage of the logos, in whatever sense it is understood: in the pre-Socratic or the philosophical sense, in the sense of God's infinite understanding or in the anthropological sense, in the pre-Hegelian or the post-Hegelian sense. Within this logos, the original and essential link to the *phone* has never been broken. It would be easy to demonstrate this and I shall attempt such a demonstration later. As has been more or less implicitly determined, the essence of the *phone* would be immediately proximate to that which within "thought" as logos relates to "meaning," produces it, receives it, speaks it, "composes" it. If, for Aristotle, for example, "spoken words (ta en te phone) are the symbols of mental experience (pathemata tes psyches) and written words are the symbols of spoken words" (*De interpretatione*, 1, 16a 3) it is because the voice, producer of *the first symbols*, has a relationship of essential and immediate proximity with the mind. Producer of the first signifier, it is not just a simple signifier among others. It signifies "mental experiences" which themselves reflect or mirror things by natural resemblance. Between being and mind, things and feelings, there would be a relationship of translation or natural signification; between mind and logos, a relationship of conventional symbolization. And the *first* convention, which would relate immediately to the order of natural and universal signification, would be produced as spoken language. Written language would establish the conventions, interlinking other conventions with them.

Just as all men have not the same writing so all men have not the same speech sounds, but mental experiences, of which these are the *primary symbols (semeia protos)*, are the same for all, as also are those things of which our experiences are the images (*De interpretatione*, 1, 16a. Italics added).

The feelings of the mind, expressing things naturally, constitute a sort of universal language which can then efface itself. It is the stage of transparency. Aristotle can sometimes omit it without risk. In every case, the voice is closest to the signified, whether it is determined strictly as sense (thought or lived) or more loosely as thing. All signifiers, and first and foremost the written signifier, are derivative with regard to what would wed the voice indissolubly to the mind or to the thought of the signified sense, indeed to the thing itself (whether it is done in the Aristotelian manner that we have just indicated or in the manner of medieval theology, determining the *res* as a thing created from its *eidos*, from its sense thought in the logos or in the infinite understanding of God). The written signifier is always technical and representative. It has no constitutive meaning. This derivation is the very origin of the notion of the "signifier." The notion of the sign always implies within itself the distinction between signifier and signified, even if, as Saussure argues, they are distinguished simply as the two sides of one and the same leaf. This notion remains therefore within the heritage of that logocentrism which is also a phonocentrism: absolute proximity of voice and being, of voice and the meaning of being, of voice and the ideality of meaning. Hegel demonstrates very clearly the strange privilege of sound in idealization, the production of the concept and the self-presence of the subject.

This ideal motion, in which through the sound what is as it were the simple subjectivity [*Subjektivitat*], the soul of the material thing expresses itself, the ear receives also in a theoretical [*theoretisch*] way, just as the eye shape and colour, thus allowing the inter-

iority of the object to become interiority itself [*läßt dadurch das Innere der Gegenstände für das Innere selbst werden*] (*Esthétique*, III. I tr. fr. p. 16). ... The ear, on the contrary, perceives [*vernimmt*] the result of that interior vibration of material substance without placing itself in a practical relation toward the objects, a result by means of which it is no longer the material form [*Gestalt*] in its repose, but the first, more ideal activity of the soul itself which is manifested [*zum Vorschein kommt*] (p. 296).

What is said of sound in general is a fortiori valid for the *phone* by which, by virtue of hearing (understanding)-oneself-speak - an indissociable system - the subject affects itself and is related to itself in the element of ideality.

We already have an indication that phonocentrism merges with the historical determination of the meaning of being in general as *presence*, with all the subdeterminations which depend on this general form and which organize within it their system and their historical sequence (presence of the thing to the sight as *eidos*, presence as substance/essence/existence [*ousid*], temporal presence as point [*stigma*] of the now or of the moment [*nun*], the self-presence of the cogito, consciousness, subjectivity, the co-presence of the other and of the self, intersubjectivity as the intentional phenomenon of the ego, and so forth). Logocentrism would thus support the determination of the being of the entity as presence. To the extent that such a logocentrism is not totally absent from Heidegger's thought, perhaps it still holds that thought within the epoch of onto-theology, within the philosophy of presence, that is to say within philosophy *itself*. This would perhaps mean that one does not leave the epoch whose closure one can outline. The movements of belonging or not belonging to the epoch are too subtle, the illusions in that regard are too easy, for us to make a definite judgement.

The epoch of the logos thus debases writing considered as mediation of mediation and as a fall into the exteriority of meaning. To this epoch belongs the difference between signified and signifier, or at least the strange separation of their "parallelism," and the exteriority, however extenuated, of the one to the other. This appurtenance is organized and hierarchized in a history. The difference between signified and signifier belongs in a profound and implicit way to the totality of the great epoch covered by the history of metaphysics, and in a more explicit and more systematically articulated way to the narrower epoch of Christian creationism and infinitism when these appropriate the resources of Greek conceptuality. This appurtenance is essential and irreducible; one cannot retain the convenience or the "scientific truth" of the Stoic and later medieval opposition between *signans* and *signatum* without also bringing with it all its metaphysico-theological roots. To these roots adheres not only the distinction between the sensible and the intelligible - already a great deal - with all that it controls, namely, metaphysics in its totality. And this distinction is generally accepted as self-evident by the most careful linguists and semiologists, even by those who believe that the scientificity of their work begins where metaphysics ends. Thus, for example:

As modern structural thought has clearly realized, language is a system of signs and linguistics is part and parcel of the science of signs, or *semiotics* (Saussure's *semiologie*). The medieval definition of sign - "*aliquid stat pro aliquo*" - has been resurrected and

Georg Wilhelm Friedrich Hegel, *Werke*, Suhrkamp edition (Frankfurt am Main, 1970), vol. 14, p. 256; translated as *The Philosophy of Fine Art* by F. P. Osmaston (London, 1920), vol. 3, pp. 15-16. ' Hegel, p. 134; Osmaston, p. 341.

put forward as still valid and productive. Thus the constitutive mark of any sign in general and of any linguistic sign in particular is its twofold character: every linguistic unit is bipartite and involves both aspects - one sensible and the other intelligible, or in other words, both the *signans* "signifier" (Saussure's *signifiant*) and the *signatum* "signified" (*signifié*). These two constituents of a linguistic sign (and of sign in general) necessarily suppose and require each other.⁶

But to these metaphysico-theological roots many other hidden sediments cling. The semiological or, more specifically, linguistic "science" cannot therefore hold on to the difference between signifier and signified - the very idea of the sign - without the difference between sensible and intelligible, certainly, but also not without retaining, more profoundly and more implicitly, and by the same token the reference to a signified able to "take place" in its intelligibility, before its "fall," before any expulsion into the exteriority of the sensible here below. As the face of pure intelligibility, it refers to an absolute logos to which it is immediately united. This absolute logos was an infinite creative subjectivity in medieval theology: the intelligible side of the sign remains turned toward the word and the face of God.

Of course, it is not a question of "rejecting" these notions; they are necessary and, at least at present, nothing is conceivable for us without them. It is a question at first of demonstrating the systematic and historical solidarity of the concepts and gestures of thought that one often believes can be innocently separated. The sign and divinity have the same place and time of birth. The age of the sign is essentially theological. Perhaps it will never *end*. Its historical *closure* is, however, outlined.

Since these concepts are indispensable for unsettling the heritage to which they belong, we should be even less prone to renounce them. Within the closure, by an oblique and always perilous movement, constantly risking falling back within what is being deconstructed, it is necessary to surround the critical concepts with a careful and thorough discourse - to mark the conditions, the medium, and the limits of their effectiveness and to designate rigorously their intimate relationship to the machine whose deconstruction they permit; and, in the same process, designate the crevice through which the yet unnameable glimmer beyond the closure can be glimpsed. The concept of the sign is here exemplary. We have just marked its metaphysical appurtenance. We know, however, that the thematics of the sign have been for about a century the agonized labor of a tradition that professed to withdraw meaning, truth, presence, being, etc., from the movement of signification. Treating as suspect, as I just have, the difference between signified and signifier, or the idea of the sign in general, I must state explicitly that it is not a question of doing so in terms of the instance of the present truth, anterior, exterior or superior to the sign, or in terms of the place of the effaced difference. Quite the contrary. We are disturbed by that which, in the concept of the sign - which has never existed or functioned outside the history of (the) philosophy (of presence) - remains systematically and genealogically determined by that history. It is there that the concept and above all the work of deconstruction, its "style," remain by nature exposed to misunderstanding and nonrecognition.

The exteriority of the signifier is the exteriority of writing in general, and I shall try to show later that there is no linguistic sign before writing. Without that exteriority, the very idea of the sign falls into decay. Since our entire world and language would collapse with it, and since its evidence and its value keep, to a certain point of derivation, an indestructible solidity, it would be silly to conclude from its placement

within an epoch that it is necessary to "move on to something else," to dispose of the sign, of the term and the notion. For a proper understanding of the gesture that we are sketching here, one must understand the expressions "epoch," "closure of an epoch," "historical genealogy" in a new way; and must first remove them from all relativism.

Thus, within this epoch, reading and writing, the production or interpretation of signs, the text in general as fabric of signs, allow themselves to be confined within secondariness. They are preceded by a truth, or a meaning already constituted by and within the element of the logos. Even when the thing, the "referent," is not immediately related to the logos of a creator God where it began by being the spoken/ thought sense, the signified has at any rate an immediate relationship with the logos in general (finite or infinite), and a mediated one with the signifier, that is to say with the exteriority of writing. When it seems to go otherwise, it is because a metaphoric mediation has insinuated itself into the relationship and has simulated immediacy; the writing of truth in the soul, opposed by *Phaedrus* (278a) to bad writing (writing in the "literal" [*propre*] and ordinary sense, "sensible" writing, "in space"), the book of Nature and God's writing, especially in the Middle Ages; all that functions as *metaphor* in these discourses confirms the privilege of the logos and founds the "literal" meaning then given to writing: a sign signifying a signifier itself signifying an eternal truth, eternally thought and spoken in the proximity of a present logos. The paradox to which attention must be paid is this: natural and universal writing, intelligible and nontemporal writing, is thus named by metaphor. A writing that is sensible, finite, and so on, is designated as writing in the literal sense; it is thus thought on the side of culture, technique, and artifice; a human procedure, the ruse of a being accidentally incarnated or of a finite creature. Of course, this metaphor remains enigmatic and refers to a "literal" meaning of writing as the first metaphor. This "literal" meaning is yet unthought by the adherents of this discourse. It is not, therefore, a matter of inverting the literal meaning and the figurative meaning but of determining the "literal" meaning of writing as metaphoricity itself.

In "The Symbolism of the Book," that excellent chapter of *European Literature and the Latin Middle Ages*, E. R. Curtius describes with great wealth of examples the evolution that led from the *Phaedrus* to Calderon, until it seemed to be "precisely the reverse" (tr. fr. p. 372) by the "newly attained position of the book" (p. 374) [p. 306]. But it seems that this modification, however important in fact it might be, conceals a fundamental continuity. As was the case with the Platonic writing of the truth in the soul, in the Middle Ages too it is a writing understood in the metaphoric sense, that is to say a *natural*, eternal, and universal writing, the system of signified truth, which is recognized in its dignity. As in the *Phaedrus*, a certain fallen writing continues to be opposed to it. There remains to be written a history of this metaphor, a metaphor that systematically contrasts divine or natural writing and the human and laborious, finite and artificial inscription. It remains to articulate rigorously the stages of that history, as marked by the quotations below, and to follow the theme of God's book (nature or law, indeed natural law) through all its modifications.

Ernst Robert Curtius, "Das Buch als Symbol." *Europäische Literatur und lateinisches Mittelalter* (Bern, 1948), p. 307. French translation by Jean Breyoux (Paris, 1956): translated as *European Literature and the Latin Middle Ages*, by Willard R. Trask, Harper Torchbooks edition (New York, 1963), pp. 305, 306.

Rabbi Eliezer said: "If all the seas were of ink, and all ponds planted with reeds, if the sky and the earth were parchments and if all human beings practised the art of writing - they would not exhaust the Torah I have learned, just as the Torah itself would not be diminished any more than is the sea by the water removed by a paint brush dipped in it."⁷

Galileo: "It [the book of Nature] is written in a mathematical language."

Descartes: "... to read in the great book of Nature..."

Demea, in the name of natural religion, in the *Dialogues*,... of Hume: "And this volume of nature contains a great and inexplicable riddle, more than any intelligible discourse or reasoning."⁸

Bonnet: "It would seem more philosophical to me to presume that our earth is a book that God has given to intelligences far superior to ours to read, and where they study in depth the infinitely multiplied and varied characters of His adorable wisdom."

G. H. von Schubert: "This language made of images and hieroglyphs, which supreme Wisdom uses in all its revelations to humanity - which is found in the inferior [*nieder*] language of poetry - and which, in the most inferior and imperfect way [*auf der allerniedrigsten und unvollkommensten*], is more like the metaphorical expression of the dream than the prose of wakefulness,... we may wonder if this language is not the true and wakeful language of the superior regions. If, when we consider ourselves awakened, we are not plunged in a millennial slumber, or at least in the echo of its dreams, where we only perceive a few isolated and obscure words of God's language, as a sleeper perceives the conversation of the people around him."⁹

Jaspers: "The world is the manuscript of an other, inaccessible to a universal reading, which only existence deciphers."¹⁰

Above all, the profound differences distinguishing all these treatments of the same metaphor must not be ignored. In the history of this treatment, the most decisive separation appears at the moment when, at the same time as the science of nature, the determination of absolute presence is constituted as self-presence, as subjectivity. It is the moment of the great rationalisms of the seventeenth century. From then on, the condemnation of fallen and finite writing will take another form, within which we still live: it is non-self-presence that will be denounced. Thus the exemplariness of the "Rousseauist" moment, which we shall deal with later, begins to be explained. Rousseau repeats the Platonic gesture by referring to another model of presence: self-presence in the senses, in the sensible cogito, which simultaneously carries in itself the inscription of divine law. On the one hand, *representative*, fallen, secondary, instituted writing, writing in the literal and strict sense, is condemned in *The Essay*

Quoted in Curtius, op. cit. (German), p. 326, (English), p. 324; Galileo's word is "philosophy" rather than "nature."

⁷ Ibid. (German) p. 324, (English) p. 322.

⁸ David Hume, *Dialogues Concerning Natural Religion*, ed. Norman Kemp Smith (Oxford, 1935), p. 193. ⁹ Gotthilf Heinrich von Schubert, *Die Symbolik des Traumes* (Leipzig, 1862), pp. 23-4. ¹⁰ Quoted in P. Ricoeur, *Gabriel Marcel et Karl Jaspers* (Paris, 1947), p. 45.

on the *Origin of Languages* (it "enervates" speech; to "judge genius" from books is like "painting a man's portrait from his corpse," etc.). Writing in the common sense is the dead letter, it is the carrier of death. It exhausts life. On the other hand, on the other side of the same proposition, writing in the metaphoric sense, natural, divine, and living writing, is venerated; it is equal in dignity to the origin of value, to the voice of conscience as divine law, to the heart, to sentiment, and so forth.

The Bible is the most sublime of all books,... but it is after all a book ____ It is not at all in a few sparse pages that one should look for God's law, but in the human heart where His hand deigned to write (*Lettre a Vernes*).

If the natural law had been written only in the human reason, it would be little capable of directing most of our actions. But it is also engraved in the heart of man in ineffaceable characters _ There it cries to him (*L'etat de guerre.*)'

Natural writing is immediately united to the voice and to breath. Its nature is not grammatological but pneumatological. It is hieratic, very close to the interior holy voice of the *Profession of Faith*, to the voice one hears upon retreating into oneself: full and truthful presence of the divine voice to our inner sense: "The more I retreat into myself, the more I consult myself, the more plainly do I read these words written in my soul: be just and you will be happy.... I do not derive these rules from the principles of the higher philosophy. I find them in the depths of my heart written by nature in characters which nothing can efface.""

There is much to say about the fact that the native unity of the voice and writing is *prescriptive*. Arche-speech is writing because it is a law. A natural law. The beginning word is understood, in the intimacy of self-presence, as the voice of the other and as commandment.

There is therefore a good and a bad writing: the good and natural is the divine inscription in the heart and the soul; the perverse and artful is technique, exiled in the exteriority of the body. A modification well within the Platonic diagram: writing of the soul and of the body, writing of the interior and of the exterior, writing of conscience and of the passions, as there is a voice of the soul and a voice of the body. "Conscience is the voice of the soul, the passions are the voice of the body" [p. 249]. One must constantly go back toward the "voice of nature," the "holy voice of nature," that merges with the divine inscription and prescription; one must encounter oneself within it, enter into a dialogue within its signs, speak and respond to oneself in its pages.

It was as if nature had spread out all her magnificence in front of our eyes to offer its text for our consideration ____ I have therefore closed all the books. Only one is open to all eyes. It is the book of Nature. In this great and sublime book I learn to serve and adore its author.

The good writing has therefore always been *comprehended*. Comprehended as that which had to be comprehended: within a nature or a natural law, created or not, but first

Correspondance complete de Jean Jacques Rousseau, ed. R. A. Leigh (Geneva, 1967), vol. V, pp. 65-6. The original reads "l'evangile" rather than "la Bible."

* Derrida's reference is *Emile*, Pleiade edition, vol. 4, pp. 589, 594. My reference is *Emile*, tr. Barbara Foxley (London, 1911), pp. 245, 249. Subsequent references to this translation are placed within brackets.

thought within an eternal presence. Comprehended, therefore, within a totality, and enveloped in a volume or a book. The idea of the book is the idea of a totality, finite or infinite, of the signifier; this totality of the signifier cannot be a totality, unless a totality constituted by the signified preexists it, supervises its inscriptions and its signs, and is independent of it in its ideality. The idea of the book, which always refers to a natural totality, is profoundly alien to the meaning of writing. It is the encyclopedic protection of theology and of logocentrism against the disruption of writing, against its aphoristic energy, and, as I shall specify later, against difference in general. If I distinguish the text from the book, I shall say that the destruction of the book, as it is now under way in all domains, denudes the surface of the text. That necessary violence responds to a violence that was no less necessary.

The written being/the being written

The reassuring evidence within which Western tradition had to organize itself and must continue to live would therefore be as follows: the order of the signified is never contemporary, is at best the subtly discrepant inverse or parallel - discrepant by the time of a breath - from the order of the signifier. And the sign must be the unity of a heterogeneity, since the signified (sense or thing, noeme or reality) is not in itself a signifier, a *trace*: in any case is not constituted in its sense by its relationship with a possible trace. The formal essence of the signified is *presence*, and the privilege of its proximity to the logos as *phone* is the privilege of presence. This is the inevitable response as soon as one asks: "what is the sign?," that is to say, when one submits the sign to the question of essence, to the "ti esti." The "formal essence" of the sign can only be determined in terms of presence. One cannot get around that response, except by challenging the very form of the question and beginning to think that the sign ^ that ill-named thfflg, the only one, that escapes the instituting question of philosophy: "what is ... ?"

Radicalizing the concepts of *interpretation*, *perspective*, *evaluation*, *difference*, and all the "empiricist" or nonphilosophical motifs that have constantly tormented philosophy throughout the history of the West, and besides, have had nothing but the inevitable weakness of being produced in the field of philosophy, Nietzsche, far from remaining *simply* (with Hegel and as Heidegger wished) *within* metaphysics, contributed a great deal to the liberation of the signifier from its dependence or derivation with respect to the logos and the related concept of truth or the primary signified, in whatever sense that is understood. Reading, and therefore writing, the text were for Nietzsche "originary" operations (I put that word within quotation marks for reasons to appear later) with regard to a sense that they do not first have to transcribe or discover, which would not therefore be a truth signified in the original element and presence of the logos, as *topos noetos*, divine understanding, or the structure of a priori necessity. To save Nietzsche from a reading of the Heideggerian type, it seems that we must above all not attempt to restore or make explicit a less naive "ontology," composed of profound ontological intuitions acceding to some originary truth, an entire foundationality hidden under the appearance of an empiricist or metaphysical text. The virulence of Nietzschean thought could not be more competely misunderstood. On the contrary, one must *accentuate* the "naivete" of a breakthrough which cannot attempt a step outside of metaphysics, which cannot *criticize* metaphysics radically without still utilizing in a certain way, in a certain type or a certain style

of *text*, propositions that, read within the philosophic corpus, that is to say according to Nietzsche ill-read or unread, have always been and will always be "naïvetes," incoherent signs of an absolute appurtenance. Therefore, rather than protect Nietzsche from the Heideggerian reading, we should perhaps offer him up to it completely, underwriting that interpretation without reserve; in a *certain way* and up to the point where, the content of the Nietzschean discourse being almost lost for the question of being, its form regains its absolute strangeness, where his text finally invokes a different type of reading, more faithful to his type of writing: Nietzsche has *written what* he has written. He has written that writing - and first of all his own - is not originarily subordinate to the logos and to truth. And that this subordination has *come into being* during an epoch whose meaning we must deconstruct. Now in this direction (but only in this direction, for read otherwise, the Nietzschean demolition remains dogmatic and, like all reversals, a captive of that metaphysical edifice which it professes to overthrow. On that point and in that *order of reading*, the conclusions of Heidegger and Fink are irrefutable), Heideggerian thought would reinstate rather than destroy the instance of the logos and of the truth of being as "primum signatum": the "transcendental" signified ("transcendental" in a certain sense, as in the Middle Ages the transcendental - *ens, unum, verum, bonum* ~ was said to be the "primum cognitum") implied by all categories or all determined significations, by all lexicons and all syntax, and therefore by all linguistic signifiers, though not to be identified simply with any one of those signifiers, allowing itself to be precomprehended through each of them, remaining irreducible to all the epochal determinations that it nonetheless makes possible, thus opening the history of the logos, yet itself being only through the logos; that is, *being nothing* before the logos and outside of it. The logos of being, "Thought obeying the Voice of Being,"¹⁰ is the first and the last resource of the sign, of the difference between *signans* and *signatum*. There has to be a transcendental signified for the difference between signifier and signified to be somewhere absolute and irreducible. It is not by chance that the thought of being, as the thought of this transcendental signified, is manifested above all in the voice: in a language of words [*mots*]. The voice *is heard* (understood) - that undoubtedly is what is called conscience - closest to the self as the absolute effacement of the signifier: pure auto-affection that necessarily has the form of time and which does not borrow from outside of itself, in the world or in "reality," any accessory signifier, any substance of expression foreign to its own spontaneity. It is the unique experience of the signified producing itself spontaneously, from within the self, and nevertheless, as signified concept, in the element of ideality or universality. The unworldly character of this substance of expression is constitutive of this ideality. This experience of the effacement of the signifier in the voice is not merely one illusion among many - since it is the condition of the very idea of truth - but I shall elsewhere show in what it does delude itself. This illusion is the history of truth and it cannot be dissipated so quickly. Within the closure of this experience, the word [*mot*] is lived as the elementary and undecomposable unity of the signified and the voice, of the concept and a transparent substance of expression. This experience is considered in its greatest purity - and at the same time in the condition of its possibility - as the experience of "being." The word "being," or at any rate the words designating the sense of being in different languages, is, with some others, an "originary word" ("*Urwort*"),¹ the transcendental word assuring the possibility of being-word to all other words. As such, it is precomprehended in all language and -

this is the opening of *Being and Time* - only this precomprehension would permit the opening of the question of the meaning of being in general, beyond all regional ontologies and all metaphysics: a question that broaches philosophy (for example, in the *Sophist*) and lets itself be taken over by philosophy, a question that Heidegger repeats by submitting the history of metaphysics to it. Heidegger reminds us constantly that the meaning of being is neither the word "being" nor the concept of being. But as that meaning is nothing outside of language and the language of words, it is tied, if not to a particular word or to a particular system of language (*concesso non dato*), at least to the possibility of the word in general. And to the possibility of its irreducible simplicity. One could thus think that it remains only to choose between two possibilities. (1) Does a modern linguistics, a science of signification breaking the unity of the word and breaking with its alleged irreducibility, still have anything to do with "language?" Heidegger would probably doubt it. (2) Conversely, is not all that is profoundly meditated as the thought or the question of being enclosed within an old linguistics of the word which one practices here unknowingly? Unknowingly because such a linguistics, whether spontaneous or systematic, has always had to share the presuppositions of metaphysics. The two operate on the same grounds.

It goes without saying that the alternatives cannot be so simple.

On the one hand, if modern linguistics remains completely enclosed within a classical conceptuality, if especially it naively uses the word *being* and all that it presupposes, that which, within this linguistics, deconstructs the unity of the word in general can no longer, according to the model of the Heideggerian question, as it functions powerfully from the very opening of *Being and Time*, be circumscribed as ontic science or regional ontology. In as much as the question of being unites indis-solubly with the precomprehension of the *word being*, without being reduced to it, the linguistics that works for the deconstruction of the constituted unity of that word has only, in fact or in principle, to have the question of being posed in order to define its field and the order of its dependence.

Not only is its field no longer simply ontic, but the limits of ontology that correspond to it no longer have anything regional about them. And can what I say here of linguistics, or at least of a certain work that may be undertaken within it and thanks to it, not be said of all research *in as much as and to the strict extent that* it would finally deconstitute the founding concept-words of ontology, of being in its privilege? Outside of linguistics, it is in psychoanalytic research that this breakthrough seems at present to have the greatest likelihood of being expanded.

Within the strictly limited space of this breakthrough, these "sciences" are no longer *dominated* by the questions of a transcendental phenomenology or a fundamental ontology. One may perhaps say, following the order of questions inaugurated by *Being and Time* and radicalizing the questions of Husserlian phenomenology, that this breakthrough does not belong to science itself, that what thus seems to be produced within an ontic field or within a regional ontology, does not belong to them by rights and leads back to the question of being itself.

Because it is indeed the *question* of being that Heidegger asks metaphysics. And with it the question of truth, of meaning, of the logos. The incessant meditation upon that question does not restore confidence. On the contrary, it dislodges the confidence at its own depth, which, being a matter of the meaning of being, is more difficult than is often believed. In examining the state just before all determinations

of being, destroying the securities of onto-theology, such a meditation contributes, quite as much as the most contemporary linguistics, to the dislocation of the unity of the meaning of being, that is, in the last instance, the unity of the word.

It is thus that, after evoking the "voice of being," Heidegger recalls that it is silent, mute, insonorous, wordless, originally *a-phonic* (*die Gewdhr der lautlosen Stimme verborgener Quellen...*). The voice of the sources is not heard. A rupture between the originary meaning of being and the word, between meaning and the voice, between "the voice of being" and the "*phone*" between "the call of being," and articulated sound; such a rupture, which at once confirms a fundamental metaphor, and renders it suspect by accentuating its metaphoric discrepancy, translates the ambiguity of the Heideggerian situation with respect to the metaphysics of presence and logocentrism. It is at once contained within it and transgresses it. But it is impossible to separate the two. The very movement of transgression sometimes holds it back short of the limit. In opposition to what we suggested above, it must be remembered that, for Heidegger, the meaning of being is never simply and rigorously a "signified." It is not by chance that that word is not used; that means that being escapes the movement of the sign, a proposition that can equally well be understood as a repetition of the classical tradition and as a caution with respect to a technical or metaphysical theory of signification. On the other hand, the sense of being is literally neither "primary," nor "fundamental," nor "transcendental," whether understood in the scholastic, Kantian, or Husserlian sense. The restoration of being as "transcending" the categories of the entity, the opening of the fundamental ontology, are nothing but necessary yet provisional moments. From *The Introduction to Metaphysics* onward, Heidegger renounces the project of and the word ontology. The necessary, originary, and irreducible dissimulation of the meaning of being, its occultation within the very blossoming forth of presence, that retreat without which there would be no history of being which was completely *history* and history of *being*, Heidegger's insistence on noting that being is produced as history only through the logos, and is nothing outside of it, the difference between being and the entity - all this clearly indicates that fundamentally nothing escapes the movement of the signifier and that, in the last instance, the difference between signified and signifier *is nothing*. This proposition of transgression, not yet integrated into a careful discourse, runs the risk of formulating regression itself. One must therefore *go by way of* the question of being as it is directed by Heidegger and by him alone, at and beyond onto-theology, in order to reach the rigorous thought of that strange nondifference and in order to determine it correctly. Heidegger occasionally reminds us that "being," as it is fixed in its general syntactic and lexicological forms within linguistics and Western philosophy, is not a primary and absolutely irreducible signified, that it is still rooted in a system of languages and an historically determined "significance," although strangely privileged as the virtue of disclosure and dissimulation; particularly when he invites us to meditate on the "privilege" of the "third person singular of the present indicative" and the "infinitive." Western metaphysics, as the limitation of the sense of being within the field of presence, is produced as the domination of a linguistic form. To question the origin of that domination does not amount to hypostatizing a transcendental signified, but to a questioning of what constitutes our history and what produced transcendentality itself. Heidegger brings it up also when in *Zur Seinsfrage*, for the same reason, he lets the word "being" be read only if it is crossed out (*kreuzweise Durchstreichung*). That mark of deletion is not, however, a "merely

Of Grammatology

negative symbol" (p. 31) [p. 83]. That deletion is the final writing of an epoch.

Under its strokes the presence of a transcendental signified is effaced while still remaining legible, is destroyed while making visible the very idea of the sign. In as much as it de-limits onto-theology, the metaphysics of presence and logocentrism,

this last writing is also the first writing.

To come to recognize, not within but on the horizon of the Heideggerian paths, and yet in them, that the meaning of being is not a transcendental or trans-epochal signified (even if it was always dissimulated within the epoch) but already, in a truly *unheard* of sense, a determined signifying trace, is to affirm that within the decisive concept of ontico-ontological difference, *all is not to be thought at one go*; entity and being, ontic and ontological, "ontico-ontological," are, in an original style, *derivative* with regard to difference; and with respect to what I shall later call *differance*, an economic concept designating the production of differing/deferring. The ontico-ontological difference and its ground (*Grund*) in the "transcendence of Dasein" (*Vom Wesen des Grundes* [Frankfurt am Main, 1955], p. 16 [p. 29]) are not absolutely originary. Differance by itself would be more "originary," but one would no longer be able to call it "origin" or "ground," those notions belonging essentially to the history of onto-theology, to the system functioning as the effacing of difference. It can, however, be thought of in the closest proximity to itself only on one condition: that one begins by determining it as the ontico-ontological difference before erasing that determination. The necessity of passing through that erased determination, the necessity of that *trick of writing* is irreducible. An unemphatic and difficult thought that, through much unperceived mediation, must carry the entire burden of our question, a question that I shall provisionally call *historial* [*historiale*]. It is with its help that I shall later be able to attempt to relate differance and writing.

The hesitation of these thoughts (here Nietzsche's and Heidegger's) is not an "incoherence": it is a trembling proper to all post-Hegelian attempts and to this passage between two epochs. The movements of deconstruction do not destroy structures from the outside. They are not possible and effective, nor can they take accurate aim, except by inhabiting those structures. Inhabiting them *in a certain way*, because one always inhabits, and all the more when one does not suspect it. Operating necessarily from the inside, borrowing all the strategic and economic resources of subversion from the old structure, borrowing them structurally, that is to say without being able to isolate their elements and atoms, the enterprise of deconstruction always in a certain way falls prey to its own work. This is what the person who has begun the same work in another area of the same habitation does not fail to point out with zeal. No exercise is more widespread today and one should be able to formalize its rules.

Hegel was already caught up in this game. *On the one hand*, he undoubtedly *summed up* the entire philosophy of the logos. He determined ontology as absolute logic; he assembled all the delimitations of philosophy as presence; he assigned to presence the eschat-ology of parousia, of the self-proximity of infinite subjectivity. And for the same reason he had to debase or subordinate writing. When he criticizes the Leibnizian characteris-, tic, the formalism of the understanding, and mathematical symbolism, he makes the same gesture: denouncing the being-outside-of-itself of the logos in the sensible or the intellectual abstraction. Writing is that forgetting of the self, that exteriorization, the contrary of the interiorizing memory, of the *Erinnerung* that opens the history of the spirit. It is this that the *Phaedrus* said: writing is at once mnemotechnique and the power of forgetting. Naturally, the Hegelian critique of writing stops at the alphabet. As

phonetic writing, the alphabet is at the same time more servile, more contemptible more secondary ("alphabetic writing expresses *sounds* which are themselves signs. It consists therefore of the signs of signs [*'aus Zeichen der Zeichen'*"] *Enzyklopadie*, § 459 but it is also the best writing, the mind's writing; its effacement before the voice, that in it which respects the ideal inferiority of phonic signifiers, all that by which it sublimates space and sight, all that makes of it the writing of history, the writing, that is, of the

infinite spirit relating to itself in its discourse and its culture:

It follows that to learn to read and write an alphabetic writing should be regarded as a means to infinite culture (*unendliches Bildungsmittel*) that is not enough appreciated; because thus the mind, distancing itself from the concrete sense-perceptible, directs its attention on the more formal moment, the sonorous word and its abstract elements, and contributes essentially to the founding and purifying of the ground of inferiority within *the* subject.

in that sense it is the *Aufhebung* of other writings, particularly of hieroglyphic script and of the Leibnizian characteristic that had been criticized previously through one and the same gesture. (*Aufhebung* is, more or less implicitly, the dominant concept of nearly all histories of writing, even today. It is *the* concept of history and of teleology.) In fact, Hegel continues: "Acquired habit later also suppresses the specificity of alphabetic writing, which consists in seeming to be, in the interest of sight, a detour [*Umweg*] through hearing to arrive at representations, and makes it into a hieroglyphic script for us, such that in using it, we do not need to have present to our consciousness the mediation of sounds."

It is on this condition that Hegel subscribes to the Leibnizian praise of nonphonetic writing. It can be produced by deaf mutes, Leibniz had said. Hegel:

Beside the fact that, by the practice which transforms this alphabetic script into hieroglyphics, the aptitude for abstraction acquired through such an exercise *is conserved* [italics added], the reading of hieroglyphs is for itself a deaf reading and a mute writing (*ein taubes Lesen und ein stummes Schreiben*).

What is audible or temporal, visible or spatial, has each its proper basis and in the first place they are of equal value; but in alphabetic script there is only *one basis* and that following a specific relation, namely, that the visible language is related only as a sign to the audible language; intelligence expresses itself immediately and unconditionally through speech (ibid.). What writing itself, in its nonphonetic moment, betrays, is life. It menaces at once the breath, the spirit, and history as the spirit's relationship with itself. It is their end, their finitude, their paralysis. Cutting breath short, sterilizing or immobilizing spiritual creation in the repetition of the letter, in the commentary or the *exegesis*, confined in a narrow space reserved for a minority, it is the principle of death and of difference in the becoming of being. It is to speech what China is to Europe: "It is only to the exegeticism¹⁴ of Chinese spiritual culture that their hieroglyphic writing is suited. This type of writing is, besides, the part reserved for a very small section of a people,

the section that possesses the exclusive domain of spiritual culture....A hieroglyphic script would require a philosophy as exegetical as Chinese culture generally is" (ibid.). *Enzyklopadie der philosophischen Wissenschaften in Grundrisse*, Suhrkamp edition (Frankfurt am Main, 1970), pp. 273-6).

If the nonphonetic moment menaces the history and the life of the spirit as self-presence in the breath, it is because it menaces substantiality, that other metaphysical name of presence and of *ousia*. First in the form of the substantive. Nonphonetic writing breaks the noun apart. It describes relations and not appellations. The noun and the word, those unities of breath and concept, are effaced within pure writing. In that regard, Leibniz is as disturbing as the Chinese in Europe: "This situation, the analytic notation of representations in hieroglyphic script, which seduced Leibniz to the point of wrongly preferring this script to the alphabetic, rather contradicts the fundamental exigency of language in general, namely the noun _____ All difference [*Abweichung*] in analysis would produce another formation of the written substantive."

The horizon of absolute knowledge is the effacement of writing in the logos, the retrieval of the trace in parousia, the reappropriation of difference, the accomplishment of what I have elsewhere called¹⁵ the *metaphysics of the proper* [*le propre* - self-possession, propriety, property, cleanliness].

Yet, all that Hegel thought within this horizon, all, that is, except eschatology, may be reread as a meditation on writing. Hegel is *also* the thinker of irreducible difference. He rehabilitated thought as the *memory productive* of signs. And he reintroduced, as I shall try to show elsewhere, the essential necessity of the written trace in a philosophical - that is to say Socratic - discourse that had always believed it possible to do without it; the last philosopher of the book and the first thinker of writing....

The theorem and the theater

[In Rousseau's *Essay on the Origin of Languages*] the history of the voice and its writing is comprehended between two mute writings, between two poles of universality relating to each other as the natural and the artificial: the pictogram and algebra. The relationship of natural to artificial or arbitrary is itself subject to the law of "extremes" which "touch one another." And if Rousseau suspects alphabetic writing without condemning it absolutely, it is because there are worse. It is structurally but the next to the last step of that history. Its artifice has a limit. Unbound to any particular language, it yet refers to the *phone* or language in general. As phonetic writing, it keeps an essential relationship to the presence of a speaking subject *in general*, to a transcendental locutor, to the voice as the self-presence of a life which hears itself speak. In that sense, phonetic writing is not absolute evil. It is not the letter of death. Nevertheless, it announces death. To the extent that that writing progresses with consonantic chilling, it allows the anticipation of the ice, speech degree zero: the disappearance of the vowel, the writing of a dead language. The consonant, which is easier to write than the vowel, initiates this end of speech in the universal writing, in algebra:

It would be easy to construct a language consisting solely of consonants, which could be written clearly but not spoken. Algebra has something of such a language. When the orthography of a language is clearer than its pronunciation, this is a sign that it is written more than it is spoken. This may have been true of the scholarly language of the Egyptians; as is the case for us with the dead languages. In those burdened with useless consonants, writing seems to have preceded speech: and who would doubt that such is the case with Polish? [*Essay*], Chap. 7 [p. 28].

The universal characteristic, writing become purely conventional through having broken all links with the spoken language - such then would be absolute evil. With the *Logic of Port-Royal*, Locke's *Essay*, Malebranche, and Descartes, Leibniz was one of Rousseau's primary philosophic readings. He is not cited in the *Essay* but in the fragment on *Pronunciation*. With as much suspicion as the "art of Raymond Lully" *mEmile* {p. 575} [p. 425].

Languages are made to be spoken, writing serves only as supplement to speech; if there are some languages that are only written, and that one cannot speak, belonging only to the sciences, it would be of no use in civil life. Such is algebra, such was no doubt the universal language that Leibniz looked for. It would probably have been more useful to a Metaphysician than to an Artisan (p. 1249).

The universal writing of science would thus be absolute alienation. The autonomy of the representer becomes absurd: it has attained its limit and broken with all representeds, with all living origin, with all living present. In it supplementarity is accomplished, that is to say emptied. The supplement, which is neither simply the signifier nor simply the representer, does not take the place of a signified or a represented, as is prescribed by the concepts of signification or representation or by the syntax of the words "signifier" or "representer." The supplement comes in the place of a lapse, a nonsignified or a nonrepresented, a nonpresence. There is no present before it, it is not preceded by anything but itself, that is to say by another supplement. The supplement is always the supplement of a supplement. One wishes to *go back from the supplement to the source*: one must recognize that there is *a supplement at the source*.

Thus it is always already algebraic. In its writing, the visible signifier, has always already begun to separate itself from speech and to supplant it. The nonphonetic and universal writing of science is also in that sense a *theorem*. It is enough to look in order to calculate. As Leibniz said, "*ad vocem referri non est necesse* ["it is not necessary to return to the voice"]."

Through that silent and mortal glance the complicities of science and politics are exchanged: more precisely of modern political science. "The letter killeth" (*Emile*, p. 226) [p. 159].

Where should one search, in the city, for that lost unity of glance and speech? In what *space* can one again *listen to himself*? Can the theater, which unites spectacle and discourse, not take up where the unanimous assembly left off? "For a long time now one speaks in public only through books, and if one says something in person to the public that interests it, it is in the theater" (*Pronunciation*, p. 1250).

But the theater itself is shaped and undermined by the profound evil of representation. It is that corruption itself. For the stage is not threatened by anything but itself. Theatrical representation, in the sense of exposition, of production, of that which is placed out there (that which the German *Darstellung* translates) is contaminated by supplementary representation. The latter is inscribed in the structure of representation, in the space of the stage. Let us not be mistaken, what Rousseau criticizes in the last analysis is not the content of the spectacle, the sense *represented* by it, although that *too* he criticizes: it is re-representation itself. Exactly as within the political order, the menace has the shape of the representative.

In fact, after having evoked the misdeeds of the theater considered in the content of what it stages, in its *represented*, the *Letter to d'Alembert* incriminates representation and the *representer*. "Beyond these effects of the theatre, which are relative to what is

performed [representees], there are others *no less necessary* which relate directly to the stage and to the *persons who perform [representants]*; and it is to them that the previously mentioned Genevans attribute the taste for luxury, adornment, and dissipation, whose introduction among us they rightly fear." ⁷ Immorality, then, attaches, to the very status of the representer (performer). Vice is his natural bent. It is normal that he who has taken up representation as a profession should have a taste for external and artificial signifiers, and for the perverse use of signs. Luxury, fine clothes, and dissipation are not signifiers incidentally coming about here and there, they are the crimes of the signifier or the representer itself.

Double consequence:

1. There are two sorts of public persons, two men of spectacle: on the one hand the orator or preacher, on the other the actor. The former represents himself, in him the representer and the represented are one. But the actor is born out of the rift between the representer and the represented. Like the alphabetic signifier, like the letter, the actor himself is not inspired or animated by any particular language. He signifies nothing. He hardly lives, he lends his voice. It is a mouthpiece. Of course the difference between the orator or preacher and the actor presupposes that the former does his duty, says what he has to say. If they do not assume ethical responsibility for their word, they become actors, hardly even actors, for the latter make a duty of saying what they do not think:

The orator and the preacher, it could be said, make use of their persons as does the actor. The difference is, however, very great. When the orator appears in public, it is to speak and not to show himself off; he *represents only himself*, he fills only his own proper role, speaks only in his own name, says, or ought to say, only what he thinks; *the man and the role being the same* [being] [*étant le mime être*], he is *in his place*; he is in the situation of any citizen who fulfils the functions of his estate. But an actor on the stage, displaying other sentiments than his own, saying only what he is made to say, *often representing a chimerical being*, annihilates himself, as it were, and is lost in his hero. And, in this forgetting of the man, if something remains of him, it is used as the plaything of the spectators (p. 187; italics added) [pp. 80-1].

It is the best possible situation: the actor accepts the role and loves what he incarnates. The situation may be still worse. "What shall I say of those who seem to be afraid of having too much merit as they are and who degrade themselves to the point of playing characters whom they would be quite distressed to resemble?" [p. 81].

The identity of the representer and the represented may be accomplished in two ways. The better way: by the effacement of the representer and the personal presence of the represented (the orator, the preacher); or the worse way: it is not illustrated by the actor alone (representer emptied of what he represents) but by a certain society, that of the worldly Parisians who have, in order to find themselves there, alienated themselves in a certain theater, theater of a theater, play representing the comedy of that society. "It is nevertheless solely for these people that theatrical entertainments are made. They are represented by fictitious characters in the middle of the theater, and show themselves in real ones on each side; they are at once persons of the drama on the stage, and comedians in the boxes" (*La Nouvelle Heloise*, p. 252). This total

Eloisa: or, *A Series of Original Letters*, collected and published by Mr. J. J. Rousseau, Citizen of Geneva, translated from the French, 2d edition (London, 1761), 2: 60.

alienation of the represented within the representer is the negative aspect of the social pact. In both cases, the represented is reappropriated when he is lost without reserve in his representation. In what terms should the elusive difference which separates the positive from the negative aspect, the authentic social pact from a forever-perverted theater, from a *theatrical* society, be defined?

2. The signifier is the death of the festival. The innocence of the public spectacle, the good festival, the dance around the water hole, would open a theater without representation. Or rather a stage without a show: without *theater*, with nothing to see. Visibility - a moment ago the theorem, here the theater - is always that which, separating it from itself, breaches [*entame*] the living voice.

But what is a stage which presents nothing to the sight? It is the place where the spectator, presenting himself as spectacle, will no longer be either seer [*voyant*] or voyeur, will efface within himself the difference between the actor and the spectator, the represented and the representer, the object seen and the seeing subject. With that difference, an entire series of oppositions will deconstitute themselves one by one. Presence will be full, not as an object which is *present* to be seen, to give itself to intuition as an empirical unit or as an *eidos* holding itself *in front of or up against*; it will be full as the intimacy of a self-presence, as the consciousness or the sentiment of self-proximity, of self-sameness [*propriete*]. That public festival will therefore have a form analogous to the electoral meetings of a free and legiferant assembled people: the representative difference will be effaced in the self-presence of sovereignty. "The exaltation of the collective festival has the same structure as the general will of *The Social Contract*. The description of *public joy* gives us the lyrical aspect of the general will: it is the aspect that it assumes in its Sunday best." The text is well known. It recalls the evocation of the festival in the *Essay*. Let us reread it in order to recognize the desire of making *representation* disappear, with all the meanings that converge in that word: delay and delegation, repetition of a present in its sign or its concept, the proposition or opposition of a show, an object to be seen:

What! Ought there to be no entertainments in a republic? On the contrary, there ought to be many. It is in republics that they were born, it is in their bosom that they are seen to flourish with a truly festive air. [*Letter to d'Alembert*, p. 125]

These innocent spectacles will take place outdoors and they will have nothing "effeminate" or "mercenary" about them. The sign, money, ruse, passivity, and servility will be excluded from them. No one will use anyone, no one will be an object for anyone. There will no longer be, after a certain fashion, anything to see:

But what then will be the objects of these entertainments? What will be shown in them? Nothing, if you please. With liberty, wherever abundance reigns, well-being also reigns. Plant a stake crowned with flowers in the middle of a square; gather the people together there, and you will have a festival. Do better yet; let the spectators become an entertainment to themselves; make them actors themselves; do it so that each sees and loves himself in the others so that all will be better united. *Letter to M. d'Alembert*, pp. 224—5 [p. 126]

We must note that this festival without object is also a festival without sacrifice, without expense, and without play. Above all without masks. It has no outside although it takes place out of doors. It maintains itself in a purely interior relation to

itself. "So that each sees and loves himself in the others." In a certain way, it is confined and sheltered, whereas the hall of the theater, wrenched away from itself by the games and detours of representation, diverted from itself and torn by difference, multiplies the outside in itself. There are many *games* [*jeux*] within the public festival but no *play* [*jeu*] at all, if one understands by that singular term the substitution of contents, the exchange of presences and absences, chance and absolute risk. That festival represses the relationship with death; what was not necessarily implied in the description of the enclosed theatre. These analyses can turn in both directions.

At any rate, play is so much absent from the festival that the dance is admitted as the initiation into marriage and is contained within the closure of the ball. Such is at least the interpretation to which Rousseau submits, to fix it carefully, the meaning of his text on the festival. One could make him say quite a different thing. And Rousseau's text must constantly be considered as a complex and many-leveled structure; in it, certain propositions may be read as interpretations of other propositions that we are, up to a certain point and with certain precautions, free to read otherwise. Rousseau says A, then for reasons that we must determine, he interprets A into B. A, which was already an interpretation, is reinterpreted into B. After taking cognizance of it, we may, without leaving Rousseau's text, isolate A from its interpretation into B, and discover possibilities and resources there that indeed belong to Rousseau's text, but were not produced or exploited by him, which, for equally legible motives, he *preferred to cut short* by a gesture neither witting nor unwitting. In his description of the festival, for example, there are propositions which could very well have been interpreted in the sense of Antonin Artaud's²⁰ theater of cruelty or of the festival and sovereignty of which Georges Bataille has proposed the concepts. But these propositions are interpreted otherwise by Rousseau himself, who transforms play into games and the dance into a ball, expense into presence.

What ball are we speaking of here? To understand that, one must first understand the praise of the open air. The open air is undoubtedly Nature and in that respect it must lead Rousseau's thoughts in a thousand ways, through all the themes of pedagogy, promenade, botany, and so on. But more precisely, the open air is the element of the voice, the liberty of a breath that nothing breaks into pieces. A voice that can make itself heard in the open air is a free voice, a clear voice that the northern principle has not yet muzzled with consonants, not yet broken, articulated, compartmentalized, and which can reach the interlocutor immediately. The open air is frankness, the absence of evasions, of representative mediations among living spoken words. It is the element of the Greek city, "the great concern" of which was "its liberty." The north limits the possibilities of the open air: "Your severer climates add to your needs; for half the year your public squares are uninhabitable; *the flatness of your languages unfits them for being heard in the open air*, you sacrifice more for profit than for liberty, and fear slavery less than poverty" (*The Social Contract*, p. 431) [p. 79; italics added]. Once again the northern influence is pernicious. But a northern man must live like a northerner. To adopt or adapt southern customs in the North is pure folly and worse servitude (*ibid.*). One must therefore find substitutes in the North or in winter. The winter substitute of the festival is our dance for young brides-to-be. Rousseau recommends the practice: unequivocally and as he himself says, without scruple; and what he says of winter illuminates after a fashion what he might have said of summer.

Winter, a time consecrated to the private association of friends, is less appropriate to public festivals. There is, however, one sort concerning which I wish there were not so many scrupulous doubts raised, that is, the balls for young marriageable persons. I have never understood why people are so worried about dancing and the gatherings it occasions, as if there were something worse about dancing than singing, as if these amusements were not both equally an inspiration of nature, as if it were a crime for those who are destined to be united to be merry together in a decent recreation. Man and woman were formed for one another. God wants them to fulfill their destiny, and certainly the first and holiest of all the bonds of society is marriage.

One should comment word by word on the long and edifying discourse that follows. A hinge articulates the entire argument: the full daylight of presence avoids the dangerous supplement. One must allow pleasures to "a lively and frolicsome youth" to avoid their "substituting more dangerous ones" and to prevent "private meetings adroitly concerted [from] tak[ing] the place of public gatherings." "Innocent joy is likely to evaporate in the full light of day; but vice is a friend of shadows" (*Letter to M. d'Alembert*, p. 227) [p. 129]. Furthermore, the nudity that presents the body itself is less dangerous than the recourse to sartorial signifiers, to the northern supplement, to "artful dress": the latter is not "less dangerous than an absolute nudity the habit of which would soon turn the first effects into indifference and perhaps distaste." "Is it not known that statues and paintings only offend the eyes when a mixture of clothing renders the nudity obscene? The immediate power of the senses is weak and limited; it is through the intermediary of the imagination that they make their greatest ravages; it is the business of the imagination to irritate the desires" (p. 232) [p. 134]. It will have been noticed that representation - the picture - rather than perception, is chosen to illustrate the danger of the supplement whose efficiency is the imagination. And it will then be noticed that, in a note inserted into the heart of this praise of marriage, anticipating the errors of posterity, Rousseau makes only one exception to his denials:

It is something amusing for me to imagine the judgments that many will make of my tastes on the basis of my writings. On the basis of this one they will not fail to say: "that man is crazy about dancing"; it bores me to watch dancing; "he cannot bear the drama"; I love the drama passionately; "he has an aversion to women"; on that score I shall be only too easily vindicated (p. 229) [p. 131 n].

Thus the North, winter, death, imagination, representation, the irritation of desires - this entire series of supplementary significations - does not designate a natural place or fixed terms: rather a periodicity. Seasons. In the order of time, or rather like time itself, they speak the movement by which the presence of the present separates from itself, supplants itself, replaces itself by absenting itself, produces itself in self-substitution. It is this that the metaphysics of presence as self-proximity wishes to efface by giving a privileged position to a sort of absolute now, the *life* of the present, the living present. The coldness of representation not only breaks self-presence but also the originarity of the present as the absolute form of temporality.

This metaphysics of presence constantly reappears and is resumed in Rousseau's text whenever the fatality of the supplement seems to limit it. It is always necessary to add a supplement of presence to the presence that is concealed. "The great remedy to the miseries of this world" is "absorption into the present moment," says

Rousseau in *The Solitaires*. The present is originary, that is to say the determination of origin always has the form of presence. Birth is the birth (of) presence. Before it there is no presence; and from the moment that presence, holding or announcing itself to itself, breaches its plenitude and starts the chain of its history, death's work has begun. Birth in general is written as Rousseau describes his own: "I cost my mother her life; and my birth was the first of my misfortunes" (*Confessions*, p. 7) [p. 5]. Every time that Rousseau tries to recapture an essence (in the form of an origin, a right, an ideal limit), he always leads us back to a point of full presence. He is less interested in the present, in the being-present, than in the presence of the present, in its essence as it appears to itself and is retained in itself. Essence is presence. As life, that is as self-presence, it is birth. And just as the present goes out of itself only to return to itself, a rebirth is possible which, furthermore, is the only thing that permits all the repetitions of origin. Rousseau's discourse and questions are possible only in the anticipation of a rebirth or a reactivation of the origin. Rebirth, resurrection, or reawakening always appropriate to themselves, in their fugitive immediacy, the plenitude of presence returning to itself.

That return to the presence of the origin is produced after each catastrophe, at least in so far as it *reverses* the order of life without destroying it. After a divine finger had *turned* the order of the world *over [renverse]* by inclining the axis of the globe on the axis of the universe and had thus willed that "men [be] sociable," the festival around the water hole was possible and pleasure was immediately present to desire. After a "great Danish dog" had *knocked Jean-Jacques over [renverse]"* in the second *Promenade*; when after "the fall" which had *precipitated* him ("my head was thrown down lower than my feet") it was first necessary to *recount* to him the "accident" that he had not been able to experience; when he explains to us what happened at the moment when, he says twice, "I came to myself," "I came back to consciousness," - it is indeed awakening as re-awakening to pure presence that he describes, always according to the same model: not anticipation, not memory, not comparison, not distinction, not articulation, not situation. Imagination, memory, and signs are effaced. All landmarks on the physical or psychical landscape are natural.

The state in which I found myself in that instant was too singular not to make a description of it here.

The night was coming on. I perceived the sky, some stars, and a little grass. This first sensation was a delicious moment. I did not feel anything except through them. I was born in that instant to life, and it seemed to me that I filled with my light existence all the objects which I perceived. Entirely given up to the present moment, I did not remember anything; I had no distinct notion of my individuality, not the least idea of what had happened to me; I did not know who I was nor where I was; I felt neither evil nor fear, nor trouble.

And, as around the water hole, and on the Isle of St. Pierre, the enjoyment [*jouissance*] of pure presence is that of a certain flow. Presence being born. Origin of life, blood's resemblance to water. Rousseau continues:

I saw my blood flowing as I might have looked at a brooklet, without dreaming even that this blood in any way belonged to me. I felt in the whole of my being a ravishing calm, to which, each time that I think of it, I find nothing comparable in the whole action of known pleasures (p. 1005) [p. 49].

Are there other or more archetypal pleasures? This pleasure, which is the only pleasure, is at the same time properly *unimaginable*. Such is the paradox of the imagination: it alone arouses or irritates desire but also it alone, and for the same reason, in the same movement, extends beyond or divides presence. Rousseau would like to separate the awakening to presence from the operation of imagination; he always presses on toward that impossible limit. For the awakening of presence projects or rejects us immediately outside of presence where we are "led... by that living interest, foresightful and all-providing [*prevoyant et pourvoyant*], which... always throws us far from the present, and which does not exist for natural man" (*Dialogues*). Function of representation, imagination is also the temporalizing function, the excess of the present and the economy of what exceeds presence. There is no unique and full present (but is there presence then?) except in the imagination's sleep: "The sleeping imagination does not know at all how to extend its being into two different times" (*Emile*, p. 69). When it appears, signs, fiduciary values [legal tender and trusts], and letters emerge, and they are worse than death.

How many merchants lament in Paris over some misfortune in India!... There is a healthy, cheerful, strong, and vigorous man; it does me good to see him __ A letter comes by post __ [He] falls into a swoon. When he comes to himself he weeps, laments, and groans, he tears his hair, and his shrieks re-echo through the air. You would say he was in convulsions. Fool, what harm has this bit of paper done you? What limb has it torn away?... We no longer live in our own place, we live outside it. What does it profit me to live in such fear of death, when all that makes life worth living remains? (*Emile*, pp. 67-8) [p. 47]

Rousseau himself articulates this chain of significations (essence, origin, presence, birth, rebirth) on the classical metaphysics of the entity as *energy*, encompassing the relationships between being and time in terms of the now as being in action (*energeia*):

Delivered from the disquietude of hope, and *sure of thus gradually losing that one desire*, seeing that the past was no longer anything to me, I undertook to put myself completely in the situation of a man who begins to live. I told myself that in fact *we were always beginning, and that there was no other link in our existence but a succession of present moments of which the first is always that which is in action*. We are born and die every moment of our life.

It follows - but it is a *liaison* that Rousseau works very hard to elide - that the very essence of presence, if it must always be repeated within any other presence, opens originarily, within presence itself, the structure of representation. And if essence *is* presence, there is no essence of presence nor presence of essence. There is a play of representation and eliding that *liaison* or that consequence, Rousseau places play out of play: he eludes, which is another way of playing, or rather, as the dictionaries say, of playing (with). What is thus eluded is the fact that representation does not suddenly encroach upon presence; it inhabits it as the very condition of its experience, of desire, and of enjoyment [*jouissance*]. The interior doubling of presence, its halving, makes it appear as such, that is to say, concealing enjoyment in frustration, makes it disappear as such. Placing representation outside, which means placing the outside outside, Rousseau would like to make of the supplement of presence a pure and simple

addition, a contingency: thus wishing to elude what, in the interior of presence, calls forth the substitute, and is constituted only in that appeal, and in its trace.

Thence the letter. Writing is the evil of representative repetition, the double that opens desire and contemplates and binds [*re-garde*] enjoyment. Literary writing, the traces of the *Confessions*, speak that doubling of presence. Rousseau condemns the evil of writing and looks for a haven within writing. It repeats enjoyment symbolically. And just as enjoyment has never been present except in a certain repetition, so writing, recalling enjoyment, gives it as well. Rousseau eludes its admission but not the pleasure. We recall those texts ("Saying to myself I have rejoiced, I rejoice again__ " "I rejoice again in a pleasure that no longer is." ... "Incessantly occupied with the thought of my past happiness, I recall it, so to speak, chew the cud of it to such an extent that, when I desire it, I am able to enjoy it over again") [p. 607]. Writing *represents* (in every sense of the word) enjoyment. It plays enjoyment, renders it present and absent. It is play. And it is because it is also the good fortune of enjoyment repeated that Rousseau practices it while condemning it: "I shall set down in writing those [delightful contemplations] which may still come to me: each time that I reread them will give me new pleasure" (*Reveries*, p. 999) [p. 38].

This entire digression was necessary in order to mark well that, unless some extrinsic desire is invested in it, Leibniz's universal characteristic represents the very death of enjoyment. It leads the representer to the limit of its excess. Phonetic writing, however abstract and arbitrary, retained some relationship with the presence of the represented voice, to its possible presence in general and therefore to that of a certain passion. A writing that breaks with the *phone* radically is perhaps the most rational and effective of scientific machines; it no longer responds to any desire or rather *it signifies its death to desire*. It was what already operated within speech as writing and machine. It is the representer in its pure state, without the represented, or without the order of the represented naturally linked to it. That is why this pure conventionality ceases, being pure, to be of any use within "civil life," which always mingles nature and convention. The perfection of convention here touches its opposite extreme, it is death and the perfect alienation of the instrument of civil order. The telos of the alienation of writing has in Rousseau's eyes the form of scientific technical writing, wherever it can act, that is to say even outside of areas reserved for "science" or "technology." It is not by chance that in mythology, the Egyptian in particular, the god of sciences and technology is also the god of writing; and that it is he (Thoth, Theuth, Teuthus or his Greek homologue Hermes, god of the ruse, of trade, and of thieves) whom Rousseau incriminates in the *Discourse on the Arts and Sciences*. (Plato had already denounced his invention of writing at the end of the *Phaedrus*.)

An ancient tradition passed out of Egypt into Greece, that some god, who was an enemy to the repose of mankind, was the inventor of the sciences. ... In fact, whether we turn to the annals of the world, or supplement with philosophical investigations the uncertain chronicles of history, we shall not find for human knowledge an origin answering to the idea we are pleased to entertain of it at present__ Their evil origin is indeed, but too plainly reproduced in their objects. [Cole, op. cit., p. 131.]

It is easy to see the allegory in the fable of Prometheus: and it does not appear that the Greeks, who chained him to the Caucasus, had a better opinion of him than the Egyptians had of their god Teuthus (p. 12).

The supplement of (at) the origin

In the last pages of the chapter "On Script," the critique, the appreciative presentation, and the history of writing, *declares* the absolute exteriority of writing but *describe* the interiority of the principle of writing to language. The sickness of the outside (which comes from the outside but also draws outside, thus equally, or inversely, the sickness of the homeland, a homesickness, so to speak) is in the heart of the living word, as its principle of effacement and its relationship to its own death. In other words, it does not suffice to show, it is in fact not a question of showing, the interiority of what Rousseau would have believed exterior; rather to speculate upon the power of exteriority as constitutive of interiority: of speech, of signified meaning, of the present as such; in the sense in which I said, a moment ago, that the representative mortal doubling-halving constituted the living present, without adding itself to presence; or rather constituted it, paradoxically, by being added to it. The question is of an originary supplement, if this absurd expression may be risked, totally unacceptable as it is within classical logic. Rather the supplement of origin: which supplements the failing origin and which is yet not derived; this supplement is, as one says of a spare part [*une piece*], of the original make [*d'origine*] [or a document, establishing the origin.]

Thus one takes into account that the absolute *alterity* of writing might nevertheless affect living speech, from the outside, within its inside: *alter it* [for the worse]. Even as it has an independent history, as we have seen, and in spite of the inequalities of development, the play of structural correlations, writing marks the history of speech. Although it is born out of "needs of a different kind" and "according to circumstances entirely independent of the duration of the people," although these needs might "never have occurred," the irruption of this absolute contingency determined the interior of an essential history and affected the interior unity of a life, *literally infected* it. It is the strange essence of the supplement not to have essentiality: it may always not have taken place. Moreover, literally, it has never taken place: it is never present, here and now. If it were, it would not be what it is, a supplement, taking and keeping the place of the other. What alters for the worse the living nerve of language ("Writing, which would seem to crystallize language, is precisely what alters it; it changes not the words but the spirit of language ... ") has therefore above all not taken place. Less than nothing and yet, to judge by its effects, much more than nothing. The supplement is neither a presence nor an absence. No ontology can think its operation.

As Saussure will do, so does Rousseau wish at once to maintain the exteriority of the system of writing and the maleficent efficiency with which one singles out its symptoms on the body of the language. But am I saying anything else? Yes, in as much as I show the interiority of exteriority, which amounts to annulling the ethical qualification and to thinking of writing beyond good and evil; yes above all, in as much as we designate the impossibility of formulating the movement of supplementarity within the classical logos, within the logic of identity, within ontology, within the opposition of presence and absence, positive and negative, and even within dialectics, if at least one determines it, as spiritualistic or materialistic metaphysics has always done, within the horizon of presence and reappropriation. Of course the *designation* of that impossibility escapes the language of metaphysics only by a hairs-breadth. For the rest, it must borrow its resources from the logic it deconstructs. And by doing so, find its very foothold there.

One can no longer see disease in substitution when one sees that the substitute is substituted for a substitute. Is that not what the *Essay describes*? "[Writing substitutes] exactitude for expressiveness." Expression is the expression of affect, of the passion at the origin of language, of a speech that was first substituted for song, marked by *tone* and *force*. Tone and force signify the *present voice*: they are anterior to the concept, they are singular, they are, moreover, attached to vowels, the vocalic and not the consonantic element of language. The force of expression amounts only to vocalic sounds, when the subject is there in person to utter his passion. When the subject is no longer there, force, intonation, and accent are lost in the concept. Then one writes, one "substitutes" in vain "accentual marks" for "accent," one bows to the generality of the law: "In writing, one is forced to use all the words according to their conventional meaning. But in speaking, one varies the meanings by varying one's tone of voice, determining them as one pleases. Being less constrained to clarity one can be more forceful. And it is not possible for a language that is written to retain its vitality as long as one that is only spoken" [*Essay*, pp. 21-2].

Thus writing is always atonal. The place of the subject is there taken by another, it is concealed. The spoken sentence, which is valuable only once and remains "proper only to the place where it is," loses its place and its proper meaning as soon as it is written down. "The means used to overcome [*supplier*] this weakness tend to stretch out written language and make it elaborately prolix; and many books written in discourse will enervate speech itself."

But if Rousseau could say that "words [*voix*], not sounds [*sons*], are written," it is because words are distinguished from sounds exactly by what permits writing - consonants and articulation. The latter replace only themselves. Articulation, which replaces accent, is the origin of languages. Altering [for the worse] through writing is an origin-ary exteriority. It is the origin of language. Rousseau describes it without declaring it. Clandestinely.

A speech without consonantic principle, what for Rousseau would be a speech sheltered from all writing, would not be speech; ³ it would hold itself at the fictive limit of the inarticulate and purely natural cry. Conversely, a speech of pure consonants and pure articulation would become pure writing, algebra, or dead language. The death of speech is therefore the horizon and origin of language. But an origin and a horizon which do not hold themselves at its exterior borders. As always, death, which is neither a present to come nor a present past, shapes the interior of speech, as its trace, its reserve, its interior and exterior difference: as its supplement.

But Rousseau could not think this writing, that takes place *before* and *within* speech. To the extent that he belonged to the metaphysics of presence, he *dreamed* of the simple exteriority of death to life, evil to good, representation to presence, signifier to signified, representer to represented, mask to face, writing to speech. But all such oppositions are irreducibly rooted in that metaphysics. Using them, one can only operate by reversal, that is to say by confirmations. The supplement is none of these terms. It is especially not more a signifier than a signified, a representer than a presence, a writing than a speech. None of the terms of this series can, being comprehended within it, dominate the economy of difference or supplementarity. Rousseau's *dream* consisted of making the supplement enter metaphysics by force.

But what does that mean? The opposition of dream to wakefulness, is not that a representation of metaphysics as well? And what should dream or writing be if, as we know now, one may dream while writing? And if the scene of dream is always a

scene of writing? At the bottom of a page of *Emile*, after having once more cautioned us against books, writing, signs ("What is the use of inscribing on their brains a list of symbols which mean nothing for them?"), after having opposed the "tracing" of these artificial signs to the "indelible characters" of the Book of Nature, Rousseau adds a note: "... the dreams of a bad night are given to us as philosophy. You will say I too am a dreamer; I admit it, but I do what others fail to do, I give my dreams as dreams, and leave the reader to discover whether there is anything in them which may prove useful to those who are awake" [p. 76].

Notes

- 1 To speak of a primary writing here does not amount to affirming a chronological priority of fact. That debate is well-known; is writing, as affirmed, for example, by Metchaninov and Marr, then Loukotka, "anterior to phonetic language?" (A conclusion assumed by the first edition of the Great Soviet Encyclopedia, later contradicted by Stalin. On this debate, cf. V. Istrine, "Langue et ecriture," *Linguistique*, pp. 35, 60. This debate also forms around the theses advanced by P. van Ginneken. On the discussion of these propositions, cf. James Fevrier, *Histoire de Vecriture* [Payot, 1948-59], pp. 5 f.). I shall try to show below why the terms and premises of such a debate are suspicious.
- 2 I shall deal with this problem more directly in *La voix et le phenomene* (Paris, 1967) [*Speech and Phenomena*].
- 3 Wiener, for example, while abandoning "semantics," and the opposition, judged by him as too crude and too general, between animate and inanimate etc., nevertheless continues to use expressions like "organs of sense," "motor organs," etc. to qualify the parts of the machine.
- 4 Cf., e.g., EP, pp. 126, 148, 355, etc. From another point of view, cf. Roman Jakobson, *Essais de linguistique generate* (tr. fr. [Nicolas Ruwet, Paris, 1963], p. 116) [Jakobson and Morris Halle, *Fundamentals of Language* (The Hague, 1956), p. 16].
- 5 This is shown by Pierre Aubenque (*Le probleme de l'etre chez Aristotle* [Paris, 1966], pp. 106 f.). In the course of a provocative analysis, to which I am here indebted, Aubenque remarks: "In other texts, to be sure, Aristotle designates as symbol the relationship between language and things: 'It is not possible to bring the things themselves to the discussion, but, instead of things, we can use their names as symbols.' The intermediary constituted by the mental experience is here suppressed or at least neglected, but this suppression is legitimate, since, mental experiences behaving like things, things can be substituted for them immediately. On the other hand, one cannot by any means substitute names for things" (pp. 107-8).
- 6 Roman Jakobson, *Essais de linguistique generate*, tr. fr., p. 162 ["The Phonemic and Grammatical Aspects of Language in their Interrelations," *Proceedings of the Sixth International Congress of Linguistics* (Paris, 1949), p. 6]. On this problem, on the tradition of the concept of the sign, and on the originality of Saussure's contribution within this continuity, cf. Ortigues, pp. 54 f.
- 7 Cited by Emmanuel Levinas, in *Difficile liberte* [Paris, 1963], p. 44.
- 8 I attempt to develop this theme elsewhere (*Speech and Phenomena*).
- 9 This does not, by simple inversion, mean that the signifier is fundamental or primary. The "primacy" or "priority" of the signifier would be an expression untenable and absurd to formulate illogically within the very logic that it would legitimately destroy. The signifier will never by rights precede the signified, in which case it would no longer be a signifier and the "signifying" signifier would no longer have a possible signified. The thought that is announced in this impossible formula without being successfully contained therein should therefore be stated in another way; it will clearly be impossible to do so without putting the very idea of the sign into suspicion, the "sign-of" which will always remain attached to what is here put in question. At the limit therefore, that thought would destroy the entire conceptuality organized around the concept of the sign (signifier and signified, expression and content, and so on).

- 13 *Introduction a la metaphysique*, tr. fr. p. 103 [*Einführung* p. 70; *Introduction*, p. 92]. "All this points in the direction of what we encountered when we characterized the Greek experience and interpretation of being. If we retain the usual interpretation of being, the word 'being' takes its meaning from the unity and determinateness of the horizon which guided our understanding. In short: we understand the verbal substantive 'Sein' through the infinitive, which in turn is related to the 'is' and its diversity that I have described. The definite and particular verb form 'is,' the *third person singular of the present indicative*, has here a pre-eminent rank. We understand 'being' not in regard to the 'thou art,' 'you are,' 'I am,' or 'they would be,' though all of these, just as much as 'is,' represent verbal inflections of 'to be.'...And involuntarily, almost as though nothing else were possible, we explain the infinitive 'to be' to ourselves through the 'is.'
 "Accordingly, 'being' has the meaning indicated above, recalling the Greek view of the essence of being, hence a determinateness which has not just dropped on us accidentally from somewhere but has dominated our historical being-there since antiquity. At one stroke our search for the definition of the meaning of the word 'being' becomes explicitly what it is, namely a reflection on the source of our hidden history." I should, of course, cite the entire analysis that concludes with these words.
- 14 *dem Statarischen*, an old German word that one has hitherto been tempted to translate as "immobile" or "static" (see [Jean] Gibelin [tr. *Lefons sur la philosophie de la religion* (Paris, 1959)], pp. 255-7.
- 15 "La parole soufflee," ED.
- 16 *Confessions*, p. 237 [p. 245].
- 17 Gamier edition, p. 168 [p. 57]. Italics added.
- 18 Starobinski, *La transparence*, p. 119.1 refer also to the entire chapter devoted to the fete (p. 114), which Starobinski opposes to the theater as a "*world of transparency*" to a "*world of opacity*."
- 19 It is well-known that Rousseau ruthlessly denounced the mask, from the *Letter to M. d'Alembert* to the *Nouvelle Heloise*. One of the tasks of pedagogy consists precisely in neutralizing the effects of masks upon children. For let us not forget, "all children are afraid of masks" (*Emile*, p. 43) [p. 30]. The condemnation of writing is also, as if self-evidently, an ambiguous condemnation of the mask.
- 20 Among other analogies, by this distrust, with regard to the spoken text, of Corneille and Racine who were nothing but "talkers" even though, "imitating the English," they must sometimes "place the stage itself within representation" (*La Nouvelle Heloise*, p. 253) [*Eloisa* II, p. 62]. But surely these reconciliations must be effected with the greatest caution. The context sometimes places an infinite distance between two identical propositions.
- 21 Page 226 [pp. 127-8]. One will relate to this the following passage from *Emile*: "but when spring returns, the snow will melt and the marriage will remain; you must reckon for all seasons" (p. 570) [p. 411].
- 22 Cf. also *Emile*, pp. 66-9 [pp. 46-8].
- 23 Rousseau dreams of an unarticulated language, but he describes the origin of languages as the passage from the cry to articulation. The consonant which for him goes hand in hand with articulation, is the becoming-language of sound, the becoming-phonetic of natural sonority. It is the consonant that gives the possibility of a linguistic pertinence to sound, by inscribing it within an opposition. Jakobson has shown, against current prejudices, that "in the acquisition of language, the first vocalic opposition is posterior to the first consonantal oppositions; there is thus a stage when the consonants already fulfill a distinctive function, whereas the unique vowel yet serves only as stress to the consonant and as material for expressive variations. Thus we see the consonants acquiring phonemic value before vowels" ("Les lois phoniques du langage enfantin et leur place dans la phonologie generale," *Selected Writings* [The Hague, 1962], I: 325).

Semiology and Grammatology

Jacques Derrida

In this interview from 1968, Derrida discusses two texts - his reading of Saussure in *Of Grammatology* (1967) and his reading of Husserl in *Speech and Phenomenon* (1967). In this selection, he provides a very succinct account of the significance of "différance."

Interview with Julia Kristeva

Kristeva: Semiology today is constructed on the model of the sign and its correlates: *communication* and *structure*. What are the "logocentric" and ethnocentric limits of these models, and how are they incapable of serving as the basis for a notation attempting to escape metaphysics?

Derrida: All gestures here are necessarily equivocal. And supposing, which I do not believe, that someday it will be possible *simply* to escape metaphysics, the concept of the sign will have marked, in this sense, a simultaneous impediment and progress. For if the sign, by its root and its implications, is in all its aspects metaphysical, if it is in systematic solidarity with stoic and medieval theology, the work and the displacement to which it has been submitted - and of which it also, curiously, is the instrument - have had *delimiting* effects. For this work and displacement have permitted the critique of how the concept of the sign belongs to metaphysics, which represents a simultaneous *marking* and *loosening* of the limits of the system in which this concept was born and began to serve, and thereby also represents, to a certain extent, an uprooting of the sign from its own soil. This work must be conducted as far as possible, but at a certain point one inevitably encounters "the logocentric and ethnocentric limits" of such a model. At this point, perhaps, the concept is to be abandoned. But this point is very difficult to determine, and is never pure. All the heuristic and critical resources of the concept of the sign have to be exhausted, and exhausted equally in all domains and contexts. Now, it is inevitable that not only inequalities of development (which will always occur), but also the necessity of certain contexts, will render strategically indispensable the recourse to a model known elsewhere, and even at the most novel points of investigation, to function as an obstacle.

To take only one example, one could show that a semiology of the Saussurian type has had a double role. *On the one hand*, an absolutely decisive critical role:

1 It has marked, against the tradition, that the signified is inseparable from the signifier, that the signified and signifier are the two sides of one and the same production. Saussure even purposely refused to have this opposition or this "two-sided unity" conform to the relationship between soul and body, as had always been

done. "This two-sided unity has often been compared to the unity of the human person, composed of a body and a soul. The comparison is hardly satisfactory." (*Cours de linguistique generate*, p. 145)

2 By emphasizing the *differential* and *formal* characteristics of semiological functioning, by showing that it "is impossible for sound, the material element, itself to belong to language" and that "in its essence it [the linguistic signifier] is not at all phonic" (p. 164); by desubstantializing both the signified content and the "expressive substance" - which therefore is no longer in a privileged or exclusive way phonic - by making linguistics a division of general semiology (p. 33), Saussure powerfully contributed to turning against the metaphysical tradition the concept of the sign that he borrowed from it.

And yet Saussure could not not confirm this tradition in the extent to which he continued to use the concept of the sign. No more than any other, this concept cannot be employed in both an absolutely novel and an absolutely conventional way. One necessarily assumes, in a non-critical way, at least some of the implications inscribed in its system. There is at least one moment at which Saussure must renounce drawing all the conclusions from the critical work he has undertaken, and that is the not fortuitous moment when he resigns himself to using the word "sign," lacking anything better. After having justified the introduction of the words "signified" and "signifier," Saussure writes: "As for *sign*, if we retain it, it is because we find nothing else to replace it, everyday language suggesting no other" (pp. 99-100). And, in effect, it is difficult to see how one could evacuate the *sign* when one has begun by proposing the opposition signified/signifier.

Now, "everyday language" is not innocent or neutral. It is the language of Western metaphysics, and it carries with it not only a considerable number of presuppositions of all types, but also presuppositions inseparable from metaphysics, which, although little attended to, are knotted into a system. This is why *on the other hand*:

1 The maintenance of the rigorous distinction - an essential and juridical distinction - between the *signans* and the *signatum*, the equation of the *signatum* and the concept (p. 99), inherently leaves open the possibility of thinking a *concept signified in and of itself* a concept simply present for thought, independent of a relationship to language, that is of a relationship to a system of signifiers. By leaving open this possibility - and it is inherent even in the opposition signifier/signified, that is in the sign - Saussure contradicts the critical acquisitions of which we were just speaking. He accedes to the classical exigency of what I have proposed to call a "transcendental signified," which in and of itself, in its essence, would refer to no signifier, would exceed the chain of signs, and would no longer itself function as a signifier. On the contrary, though, from the moment that one questions the possibility of such a transcendental signified, and that one recognizes that every signified is also in the position of a signifier, the distinction between signified and signifier becomes problematical at its root. Of course this is an operation that must be undertaken with prudence for: (a) it must pass through the difficult deconstruction of the entire history of metaphysics which imposed, and never will cease to impose upon semiological science in its entirety this fundamental quest for a "transcendental signified" and a concept independent of language; this quest not being imposed from without by something like "philosophy," but rather by everything that links our language, our culture, our "system of thought" to the history and system of metaphysics; (b) nor is it a question of confusing at every level, and in all simplicity, the signifier

and the signified. That this opposition or difference cannot be radical or absolute does not prevent it from functioning, and even from being indispensable within certain limits - very wide limits. For example, no translation would be possible without it. In effect, the theme of a transcendental signified took shape within the horizon of an absolutely pure, transparent, and unequivocal translatability. In the limits to which it is possible, or at least *appears* possible, translation practices the difference between signified and signifier. But if this difference is never pure, no more so is translation, and for the notion of translation we would have to substitute a notion of *transformation*: a regulated transformation of one language by another, of one text by another. We will never have, and in fact have never had, to do with some "transport" of pure signifieds from one language to another, or within one and the same language, that the signifying instrument would leave virgin and untouched.

2 Although he recognized the necessity of putting the phonic substance between brackets ("What is essential in language, we shall see, is foreign to the phonic character of the linguistic sign" [p. 21]. "In its essence it [the linguistic signifier] is not at all phonic" [p. 164]), Saussure, for essential, and essentially metaphysical, reasons had to privilege speech, everything that links the sign to *phone*. He also speaks of the "natural link" between thought and voice, meaning and sound (p. 46). He even speaks of "thought-sound" (p. 156). I have attempted elsewhere to show what is traditional in such a gesture, and to what necessities it submits. In any event, it winds up contradicting the most interesting critical motive of the *Course*, making of linguistics the regulatory model, the "pattern" for a general semiology of which it was to be, by all rights and theoretically, only a part. The theme of the arbitrary, thus, is turned away from its most fruitful paths (formalization) toward a hierarch-izing teleology: "Thus it can be said that entirely arbitrary signs realize better than any others the ideal of the semiological process; this is why language, the most complex and most widespread of the systems of expression, is also the most characteristic one of them all; in this sense linguistics can become the *general pattern for all semiology*, even though language is only a particular system" (p. 101). One finds exactly the same gesture and the same concepts in Hegel. The contradiction between these two moments of the *Course* is also marked by Saussure's recognizing elsewhere that "it is not spoken language that is natural to man, but the faculty of constituting a language, that is, a system of distinct signs..." that is, the possibility of the *code* and of *articulation*, independent of any substance, for example, phonic substance.

3 The concept of the sign (signifier/signified) carries within itself the necessity of privileging the phonic substance and of setting up linguistics as the "pattern" for semiology. *Phone*, in effect, is the signifying substance *given to consciousness* as that which is most intimately tied to the thought of the signified concept. From this point of view, the voice is consciousness itself. When I speak, not only am I conscious of being present for what I think, but I am conscious also of keeping as close as possible to my thought, or to the "concept," a signifier that does not fall into the world, a signifier that I hear as soon as I emit it, that seems to depend upon my pure and free spontaneity, requiring the use of no instrument, no accessory, no force taken from the world. Not only do the signifier and the signified seem to unite, but also, in this confusion, the signifier seems to erase itself or to become transparent, in order to allow the concept to present itself as what it is, referring to nothing other than its presence. The exteriority of the signifier seems reduced. Naturally this experience is a lure, but a lure whose necessity has organized an entire structure, or an entire

epoch; and on the grounds of this epoch a semiology has been constituted whose concepts and fundamental presuppositions are quite precisely discernible from Plato to Husserl, passing through Aristotle, Rousseau, Hegel, etc.

4 To reduce the exteriority of the signifier is to exclude everything in semiotic practice that is not psychic. Now, only the privilege accorded to the phonetic and linguistic sign can authorize Saussure's proposition according to which the "linguistic sign is therefore a two-sided *psychic* entity" (p. 99). Supposing that this proposition has a rigorous sense in and of itself, it is difficult to see how it could be extended to every sign, be it phonetic-linguistic or not. It is difficult to see therefore, except, precisely, by making of the phonetic sign the "pattern" for all signs, how general semiology can be inscribed in a psychology. However, this is what Saussure does: "One can thus conceive of a science that would study the life of signs at the heart of social life; it would form a part of social psychology, and consequently of general psychology; we will name it semiology (from the Greek *semeion*, 'sign'). It would teach what signs consist of, what laws regulate them. Since it does not yet exist, one cannot say what it will be; but it has a right to exist, its place is determined in advance. Linguistics is only a part of this general science, the laws that semiology will discover will be applicable to linguistics, and the latter will find itself attached to a well defined domain in the set of human facts. It is for the psychologist to determine the exact place of semiology" (p. 33).

Of course modern linguists and semioticians have not remained with Saussure, or at least with this Saussurean "psychologism." The Copenhagen School and all of American linguistics have explicitly criticized it. But if I have insisted on Saussure, it is not only because even those who criticize him recognize him as the founder of general semiology and borrow most of their concepts from him; but above all because one cannot simply criticize the "psychologistic" usage of the concept of the sign. Psychologism is not the poor usage of a good concept, but is inscribed and prescribed within the concept of the sign itself, in the equivocal manner of which I spoke at the beginning. This equivocality, which weighs upon the model of the sign, marks the "semiological" project itself and the organic totality of its concepts, in particular that of *communication*, which in effect implies a *transmission charged with making pass, from one subject to another, the identity of a signified object, of a meaning or of a concept* rightfully separable from the process of passage and from the signifying operation. Communication presupposes subjects (whose identity and presence are constituted before the signifying operation) and objects (signified concepts, a thought meaning that the passage of communication will have neither to constitute, nor, by all rights, to transform). *A communicates B to C*. Through the sign the emitter communicates something to a receptor, etc.

The case of the concept of *structure*, that you also bring up, is certainly more ambiguous. Everything depends upon how one sets it to work. Like the concept of the sign - and therefore of semiology - it can simultaneously confirm and shake logocentric and ethnocentric assuredness. It is not a question of junking these concepts, nor do we have the means to do so. Doubtless it is more necessary, from within semiology, to transform concepts, to displace them, to turn them against their presuppositions, to reinscribe them in other chains, and little by little to modify the terrain of our work and thereby produce new configurations; I do not believe in decisive ruptures, in an unequivocal "epistemological break," as it is called today. Breaks are always, and fatally, reinscribed in an old cloth that must continually,

interminably be undone. This interminability is not an accident or contingency; it is essential, systematic, and theoretical. And this in no way minimizes the necessity and relative importance of certain breaks, of the appearance and definition of new structures... *Kristeva*: What is the *gram* as a "new structure of nonpresence"? What is *writing* as *differance*? What rupture do these concepts introduce in relation to the key concepts of semiology - the (phonetic) *sign* and *structure*? How does the notion of *text* replace, in grammarology, the linguistic and semiological notion of what is *enounced*? *Derrida*: The reduction of writing - as the reduction of the exteriority of the signifier - was part and parcel of phonologism and logocentrism. We know how Saussure, according to the traditional operation that was also Plato's, Aristotle's, Rousseau's, Hegel's, Husserl's, etc., excludes writing from the field of linguistics - from language and speech - as a phenomenon of exterior representation, both useless and dangerous: "The linguistic object is not defined by the combination of the written word and the spoken word, the latter alone constituting this object" (p. 45); "writing is foreign to the internal system [of language]" (p. 44); "writing veils our view of language: it does not clothe language, but travesties it" (p. 51). The tie of writing to language is "superficial," "factitious." It is "bizarre" that writing, which should only be an "image," "usurps the principal role" and that "the natural relationship is inversed" (p. 47). Writing is a "trap," its action is "vicious" and "tyrannical," its misdeeds are monstrosities, "teratological cases," "linguistics should put them under observation in a special compartment" (p. 54), etc. Naturally, this representivist conception of writing ("Language and writing are two distinct sign systems; the unique *raison d'être* of the second is to *represent* the first" [p. 45]) is linked to the practice of phonetic-alphabetic writing, to which Saussure realizes his study is "limited" (p. 48). In effect, alphabetical writing seems to present speech, and at the same time to erase itself before speech. Actually, it could be shown, as I have attempted to do, that there is no purely phonetic writing, and that phonologism is less a consequence of the practice of the alphabet in a given culture than a certain ethical or axiological *experience* of this practice. Writing *should* erase itself before the plenitude of living speech, perfectly represented in the transparency of its notation, immediately present for the subject who speaks it, and for the subject who receives its meaning, content, value.

Now, if one ceases to limit oneself to the model of phonetic writing, which we privilege only by ethnocentrism, and if we draw all the consequences from the fact that there is no purely phonetic writing (by reason of the necessary spacing of signs, punctuation, intervals, the differences indispensable for the functioning of graphemes, etc.), then the entire phonologist or logocentrist logic becomes problematical. Its range of legitimacy becomes narrow and superficial. This delimitation, however, is indispensable if one wants to be able to account, with some coherence, for the principle of difference, such as Saussure himself recalls it. This principle compels us not only not to privilege one substance - here the phonic, so called temporal, substance - while excluding another - for example, the graphic, so called spatial, substance - but even to consider every process of signification as a formal play of differences. That is, of traces.

Why traces? And by what right do we reintroduce grammatics at the moment when we seem to have neutralized every substance, be it phonic, graphic, or otherwise? Of course it is not a question of resorting to the same concept of writing and of

simply inverting the dissymmetry that now has become problematical. It is a question, rather, of producing a new concept of writing. This concept can be called *gram* or *differance*. The play of differences supposes, in effect, syntheses and referrals which forbid at any moment, or in any sense, that a simple element be *present* in and of itself, referring only to itself. Whether in the order of spoken or written discourse, no element can function as a sign without referring to another element which itself is not simply present. This interweaving results in each "element" - phoneme or grapheme - being constituted on the basis of the trace within it of the other elements of the chain or system. This interweaving, this textile, is the *text* produced only in the transformation of another text. Nothing, neither among the elements nor within the system, is anywhere ever simply present or absent. There are only, everywhere, differences and traces of traces. The gram, then, is the most general concept of semiology - which thus becomes grammatology - and it covers not only the field of writing in the restricted sense, but also the field of linguistics. The advantage of this concept - provided that it be surrounded by a certain interpretive context, for no more than any other conceptual element it does not signify, or suffice, by itself - is that in principle it neutralizes the phonologistic propensity of the "sign," and *in fact counterbalances* it by liberating the entire scientific field of the "graphic substance" (history and systems of writing beyond the bounds of the West) whose interest is not minimal, but which so far has been left in the shadows of neglect.

The gram as *differance*, then, is a structure and a movement no longer conceivable on the basis of the opposition presence/absence. *Differance* is the systematic play of differences, of the traces of differences, of the *spacing* by means of which elements are related to each other. This spacing is the simultaneously active and passive (the *a* of *differance* indicates this indecision as concerns activity and passivity, that which cannot be governed by or distributed between the terms of this opposition) production of the intervals without which the "full" terms would not signify, would not function. It is also the becoming-space of the spoken chain - which has been called temporal or linear; a becoming-space which makes possible both writing and every correspondence between speech and writing, every passage from one to the other.

The activity or productivity connoted by the *a* of *differance* refers to the generative movement in the play of differences. The latter are neither fallen from the sky nor inscribed once and for all in a closed system, a static structure that a synchronic and taxonomic operation could exhaust. Differences are the effects of transformations, and from this vantage the theme of *differance* is incompatible with the static, synchronic, taxonomic, ahistoric motifs in the concept of *structure*. But it goes without saying that this motif is not the only one that defines structure, and that the production of differences, *differance*, is not astructural: it produces systematic and regulated transformations which are able, at a certain point, to leave room for a structural science. The concept of *differance* even develops the most legitimate principled exigencies of "structuralism."

Language, and in general every semiotic code - which Saussure defines as "classifications" - are therefore effects, but their cause is not a subject, a substance, or a being somewhere present and outside the movement of *differance*. Since there is no presence before and outside semiological *differance*, one can extend to the system of signs in general what Saussure says of language: "Language is necessary for speech to be intelligible and to produce all its effects; but speech is necessary for language to be established; historically, the fact of speech always comes first." There is a circle

here, for if one rigorously distinguishes language and speech, code and message, schema and usage, etc., and if one wishes to do justice to the two postulates thus enunciated, one does not know where to begin, nor how something can begin in general, be it language or speech. Therefore, one has to admit, before any dissociation of language and speech, code and message, etc. (and everything that goes along with such a dissociation), a systematic production of differences, the *production* of a system of differences - a *difference* - within whose effects one eventually, by abstraction and according to determined motivations, will be able to demarcate a linguistics of language and a linguistics of speech, etc.

Nothing - no present and *in-different* being - thus precedes *difference* and spacing. There is no subject who is agent, author, and master of *difference*, who eventually and empirically would be overtaken by *difference*. Subjectivity - like objectivity - is an effect of *difference*, an effect inscribed in a system of *difference*. This is why the *a* of *difference* also recalls that spacing is temporization, the detour and postponement by means of which intuition, perception, consummation - in a word, the relationship to the present, the reference to a present reality, to a *being* - are always *deferred*. Deferred by virtue of the very principle of difference which holds that an element functions and signifies, takes on or conveys meaning, only by referring to another past or future element in an economy of traces. This economic aspect of *difference*, which brings into play a certain not conscious calculation in a field of forces, is inseparable from the more narrowly semiotic aspect of *difference*. It confirms that the subject, and first of all the conscious and speaking subject, depends upon the system of differences and the movement of *difference*, that the subject is constituted only in being divided from itself, in becoming space, in temporizing, in deferral; and it confirms that, as Saussure said, "language [which consists only of differences] is not a function of the speaking subject." At the point at which the concept of *difference*, and the chain attached to it, intervenes, all the conceptual oppositions of metaphysics (signifier/signified; sensible/intelligible; writing/speech; passivity/activity; etc.) - to the extent that they ultimately refer to the presence of something present (for example, in the form of the identity of the subject who is present for all his operations, present beneath every accident or event, self-present in its "living speech," in its enunciations, in the present objects and acts of its language, etc.) - become nonpertinent. They all amount, at one moment or another, to a subordination of the movement of *difference* in favor of the presence of a value or a *meaning* supposedly antecedent to *difference*, more original than it, exceeding and governing it in the last analysis. This is still the presence of what we called above the "transcendental signified."

Notes

- 1 J. D. That is, the intelligible. The difference between the signifier and the signified has always reproduced the difference between the sensible and the intelligible. And it does so no less in the twentieth century than in its stoic origins. "Modern structuralist thought has clearly established this: language is a system of signs, and linguistics is an integral part of the science of signs, *semiotics* (or to use Saussure's terms, *semiology*). The medieval definition - *aliquid stat pro aliquo* - resuscitated by our epoch has shown itself to be still valid and fruitful. Thereby, the constitutive mark of every sign in general, of the linguistic sign in particular, resides in its double character: every linguistic unity is bipartite, and comports two aspects: one sensible and the

other intelligible - on the one hand, the *signans* (Saussure's *signifier*), and on the other, the *signatur* {the signified}."" (Roman Jakobson, *Essais de linguistique generale* [Paris: Editions de Minuit, 1963], p. 162.)

2 Ed. N. See *De la grammatologie*, pp. 196-8.

3 T. N. In other words, *différance* combines and confuses "differing" and "deferring" in both their active and passive senses.

Writing

Barbara Johnson

An American school of deconstructive criticism developed out of Jacques Derrida's work. Its leading proponents were Paul de Man and J. Hillis Miller. While Derrida sought to dislocate the assumptions of metaphysics in philosophy, these critics were concerned with the dislocation of naive assumptions about meaning in literary texts. Texts are figural or rhetorical, and they refer endlessly to other texts, not to a knowable presence of truth or to determinable meanings that might, as the New Critics assumed, be said to constitute "universals." In this selection, Barbara Johnson, a student of de Man and herself a leading practitioner of American deconstruction, explains how the French concern with "writing" is linked to the deconstructive project.

How is it that the word "writing" has come to be considered a critical term? Isn't "writing" simply one of those aspects of literature that can be taken for granted? Isn't it merely the medium through which a reader encounters words on a page - for example, these?

Every essay in this volume communicates to some extent *by means of* the very thing it is talking *about*. Nowhere is this more obvious than in the case of writing. An essay about writing, therefore, is an unclosable loop: it is an attempt to comprehend that which it is comprehended by. The non-Euclidean logic of such reciprocal inclusion has often itself been an object of attention in recent theoretical discussions of writing. That is only one of the consequences that the study of writing has entailed.

Writing about writing is hardly a new phenomenon, however. From Omar Khayyam's moving finger to Rousseau's trembling hand, from the broken tables of Moses to the purloined letters of Poe and Alice Walker, from Borges's encyclopedia to Wordsworth's lines left upon a seat in a yew tree, images of writing in writing testify to an enduring fascination with the mechanics and materiality of the written word. A comprehensive treatment of the question of writing is obviously beyond the scope of the present essay. I will therefore concentrate on a particular recent moment of reflection about writing - the theoretical "revolution" in France in 1967 - which has had a decisive impact upon the shape of literary studies today.

Writing (*l'écriture*) came to philosophical, psychoanalytic, and literary prominence in France in the 1960s, primarily through the work of Jacques Derrida, Roland Barthes, and other writers who were at that time associated with the journal *Tel Quel*. Philippe Sollers, in a "Program" that heads the group's collective theoretical volume, proclaimed in 1967: "A comprehensive theory arising out of a thought about the

practice of writing cries out for elaboration." Writing, it seemed, was to become the key to all mythologies. The sudden spectacular interest in writing sprang from many different sources, some of which I will outline quickly here.

As early as 1953, in *Writing Degree Zero*, Roland Barthes had investigated the paradoxical relationship that existed in the nineteenth century in France between the development of a concept of Literature (with a capital *L*) and the growing sense of a breakdown in the representational capacities of language. Literature was in some ways being exalted as a substitute religion, but it was a religion whose high priests seemed only to proclaim the obscurity, imperfection, or unreliability of their own medium. The proper names associated with the elaboration of *both* sides of this phenomenon are Flaubert and Mallarmé. These writers, says Barthes, *constructed* the object Literature in the very act of announcing its death. In later essays, Barthes lays out a theory of literature based on a split between the classic notion of a *work* (*oeuvre*) - considered as a closed, finished, reliable representational *object* - and the modern notion of a *text* - considered as an open, infinite *process* that is both meaning-generating and meaning-subverting. "Work" and "text" are thus not two different kinds of object but two different ways of viewing the written word. What interests Barthes is the *tension* between the concept of Literature and the concept of textuality. While Literature is seen as a series of discrete and highly meaningful Great Works, textuality is the manifestation of an open-ended, heterogeneous, disruptive force of signification and erasure that transgresses all closure - a force that is operative even within the Great Works themselves.

Closure versus subversion, product versus practice, meaning-containing object versus significance-scattering process: Barthes' theory of writing owes a great deal, as we shall see, both to Marxism and to psychoanalysis. But the *Tel Quel* writers' involvement with Marxism and psychoanalysis takes on its particular coloring, strangely enough, through the mediation of Saussurian linguistics. How does this happen?

In his *Course in General Linguistics* (first published by his students in 1916, with new editions in 1948 and 1966), Ferdinand de Saussure mapped out a science of linguistics based not on the historical ("diachronic") development of families of languages but on the structural ("synchronic") properties of language "as such," frozen in time as a *system*. This "structuralist" perspective, also developed in the 1950s in anthropology by Claude Lévi-Strauss, involves viewing the system as a set of relations among elements governed by rules. The favorite analogy for such systems is chess: whatever the particular properties of an individual "man" (ivory, wood, plastic), the "man" is involved in a system of moves and relations that can be known and manipulated in themselves. From the structural point of view, there is no difference between ivory and plastic. There is difference between king, queen, and knight, or between white and black.

Saussure's most enduring contribution has been his description of the *sign* as the unit of the language system. The sign is composed of two parts: a mental image or concept (the "signified"), and a phonic or graphic vehicle (the "signifier"). The sign is thus both conceptual and material, sense and sound, spirit and letter at once. The existence of numerous languages indicates that the relation between the signifier and the signified in any given sign is arbitrary (there is no natural resemblance between sound and idea), but once fixed, that relation becomes a convention that cannot be modified at will by any individual speaker. By thus deciding that what is relevant to

a structural study of language is neither history ("diachrony") nor reality (the "referent") but rather the system of differential relations among signs, Saussure set up a tremendously enabling, as well as limiting, heuristic perspective for analysis. And by asserting that signs signify not as independently meaningful units corresponding to external objects but as elements whose value is generated by their difference from neighboring elements in the system, Saussure put forth a notion of *difference* (not identity) as the origin of meaning.

Saussure's suspension of interest in history and the external world would seem to place him at the farthest remove from Marxism. But theorists of writing saw a connection between the signifier/signified relation and the materialism/idealism relation: If the signifier was the material condition of the existence of ideas, then the privileging of the signified resembled the fetishization of commodities resulting from bourgeois idealism's blindness to labor and to the material conditions of economic existence. The liberation of the signifier, the rebellion against idealist repressions, and the unleashing of the forces of difference and desire against the law and order of identity were all part of the program for change that developed in France in the 1960s. Whether linguistic materiality and economic materiality are linked *only* by analogy, or whether there is some profound interimplication between them, is still a subject for debate today. But whatever the case, the repressive return to order that followed the strikes and demonstrations in France in May 1968 squelched the optimism of those who might have believed in any simple connection between liberating the signifier and changing the class structure of society.

The understanding of what it might mean to liberate the signifier also had roots in the psychoanalytic theory of Jacques Lacan. For many years prior to the 1966 publication of his *Ecrits (Writings)*, Lacan had been conducting a seminar in which he attempted to work out a radically new way of reading Freud. What he emphasized in Freud's writing was the discovery that "the unconscious is structured like a language." The unconscious is *structured*. It is not a reservoir of amorphous drives and energies but a system of articulations through which repressed ideas return in displaced form. Freud's comparison of a dream to a rebus is extended as an analogy for all effects of the unconscious: just as each element in a rebus must be translated separately in order to decipher the total message, so each element in a dream is a knot of associations that must be explored without regard for the dream's surface coherence. Dreams, slips of the tongue, parapraxes, hysterical symptoms, and other expressions of the unconscious are for Lacan manifestations of a "signifying chain," a structure of associations that resembles an unconscious foreign language. Consciousness attempts to disregard this language in order to control and define the identity of the self, but the psychoanalyst's task is to attempt to hear that language despite the ego's efforts to scramble it. Using the terminology of Saussure, Lacan calls the units of unconscious expression "signifiers," linked to repressed "signifieds." But the search for the signified can only take the form of a sliding along the chain of signifiers. In other words, there is no one-to-one link between signifier and signified but rather an "effect of signified" generated by the movement from one signifier to another. Freud never comes to the end of his dream analyses, never "solves" their enigma, but it feels as though something like insight is achieved by following out the dreamer's chains of associations.

Lacan's troubling of Saussure's one-to-one link between signifiers and signifieds actually turns out to have its counterpart in Saussure's own work. Beginning in 1964,

Jean Starobinski began publishing strange notebooks in which Saussure attempted to prove that certain late Latin poems contained hidden proper names anagrammatically dispersed throughout their texts. The poems, in other words, contained extra signifiers, readable only to those in the know. Whether or not these anagrams were a secret key to late Latin poetics, the notion that the signifier could take the lead in creating poetic effects appealed to students of poetry. Saussure's anagrams prompted Julia Kristeva, among others, to theorize an anagrammatic (or paragrammatic) functioning in poetic language as such.

The claim that signifiers can generate effects even when the signified is unknown serves as the basis for Lacan's famous reading of Poe's story "The Purloined Letter." In that story, an unscrupulous minister steals a compromising letter from the queen under the unsuspecting eyes of the king. An amateur detective, Dupin, is commissioned by the stymied prefect of police to get the letter back. Dupin suspects that the minister has hidden the letter in plain sight, just as it had been when he stole it. Dupin then repeats the minister's act and steals the letter back for the queen. Lacan emphasizes the way in which the characters' actions are determined by the position of the letter among them. Neither the letter's contents (the never-revealed "signified") nor the individual identities of the people (the psychological equivalent of Saussure's ivory and wood chessmen) determine the course of the plot. It is the movement of the letter that dictates the characters' actions.

The rebus, the anagram, and the letter are clearly all manifestations of *writing*. They are graphic, articulated, material instantiations of systems of marks that simultaneously obscure and convey meaning. They are also something other than mere transcriptions of the spoken word. In other words, they are not examples of *phonetic* writing. It is this "something other" that must be kept in mind as we now turn to the work of the most important French theorist of writing, Jacques Derrida.

It was in 1967 that Derrida published three major books devoted to the question of writing: *Writing and Difference*, *Of Grammatology*, and *Speech and Phenomena*. Derrida's project in these writings is to reevaluate the structuring principles of Western metaphysics. Western philosophy, writes Derrida, has analyzed the world in terms of binary oppositions: mind vs. body, good vs. evil, man vs. woman, presence vs. absence. Each of these pairs is organized hierarchically: the first term is seen as higher or better than the second. According to Derrida, the opposition between speech and writing has been structured similarly: speech is seen as immediacy, presence, life, and identity, whereas writing is seen as deferment, absence, death, and difference. Speech is primary; writing secondary. Derrida calls this privileging of speech as self-present meaning "logocentrism."

In his three volumes of 1967, Derrida gives rigorous attention to the paradox that the Western tradition (the "Great Books") is filled with *writings* that privilege *speech*. By closely analyzing those writings, Derrida attempts to uncover the ways in which the Great Books rebel against their own stated intention to say that speech is better than writing. What his analyses reveal is that even when a text *tries* to privilege speech as immediacy, it cannot completely eliminate the fact that speech, like writing, is based on a *difference* (a Derridean neologism meaning both "deferment" and "difference") between signifier and signified inherent in the sign. Speakers do not beam meanings directly from one mind to another. Immediacy is an illusion. Properties normally associated with writing inevitably creep into a discussion designed to privilege speech. Thus, for example, although Saussure wishes to treat speech as primary and writing as

secondary for an understanding of language, he describes language as a "dictionary in the head" or as "linear" - a spatial term more applicable to writing than to speech. Or, to take another example, when Socrates tells Phaedrus that proper teaching must take place orally rather than in writing, he nevertheless ends up describing the truths such teaching is supposed to reach as being "*inscribed* in the soul." Because a gap of heterogeneity and distance is fundamental to the structure of language, Derrida sees "speech" as being ultimately structured like "writing." This emphasis on writing as the more originary category is designed to counter the history of logocentrism and to track the functioning of *différance* in structures of signification.

Many literary texts seem in fact to stage some version of this encounter between the search for spoken immediacy or identity and the recourse to writing and difference. The following poem by Edward Taylor (ca. 1642-1729), for example, does not seem to expect to end up talking about writing:

Meditation 6 Am I thy gold? Or purse, Lord,
 for thy wealth,
 Whether in mine or mint refined for thee? I'm
 counted so, but count me o'er thyself,
 Lest gold washed face, and brass in heart I be.
 I fear my touchstone touches when I try
 Me and my counted gold too overly.

Am I new minted by thy stamp indeed?
 Mine eyes are dim; I cannot clearly see. Be
 thou my spectacles that I may read
 Thine image and inscription stamped on me.
 If thy bright image do upon me stand,
 I am a golden angel in thy hand.

Lord, make my soul thy plate, thine image bright
 Within the circle of the same enfile
 And on its brims in golden letters write
 Thy superscription in an holy style.
 Then I shall be thy money, thou my horde:
 Let me thy angel be, be thou my Lord.

Written in a style of extended metaphor known as the metaphysical conceit, this poem sets out to express spiritual value in terms of material value (gold). The most obvious figure for the conjunction between the spiritual and the material is the word "angel," which means both a heavenly being and an old English coin. Through this spiritual/material alloy, the poem attempts to make human value both derive from and coincide with divine value, to eliminate the space of difference or distance between the human and the divine.

The poem is composed of a series of questions and imperatives addressed to God. While these aim to alleviate doubt, difference, and distance, they seem only to widen the gap they attempt to close. Am I gold or purse? value-object or container? the poet asks. He then pursues the first possibility, only to stumble upon a new inside/ outside opposition: "Lest gold washed face, and brass in heart I be." The gold begins to resemble a sign, with no guaranteed correlation between face (signifier) and heart (signified). The becoming-sign process continues in the second stanza, where the speaker is "stamped" with an image and an inscription. The speaker is now a reader,

and what he reads is himself. God has become an image, and a corrective lens. In the final stanza, the text ("inscription") that was dimly decipherable in the second stanza turns out not yet to have been written. While the poem still yearns for a perfectly reciprocal container/contained relation ("I shall be thy money, thou my horde"), this relation now requires the active intervention of writing ("in golden letters write/Thy superscription"). In his increasingly aggressive submissiveness, the speaker tries to order God to take his place as the writer.

From metal to image to letters, from touching to reading to writing, from counted to almost-read to not-yet-written, the speaker seems to be farther away from coincidence with God at the end than he was at the beginning. The mediating elements only increase the *differance*. Yet this *differance* is also the space of the poem's existence. The speaker cannot *write* his way into an immediacy that would eliminate writing. Nor can he write himself into a submissiveness great enough to overtake the fact that it is he, not God, who writes. His conceit will never succeed in erasing the "conceit" of writing itself.

The logic of writing is thus a double logic: writing is called upon as a necessary remedy for *differance*, but at the same time it *is* the very *differance* for which a remedy must be sought. In Derrida's analyses of writing, this logic is called the logic of the *supplement*. In French, the word *supplement* means both an "addition" and a "substitute." To say that "A is a *supplement* to B" is thus to say something ambiguous. Addition and substitution are not exactly contradictory, but neither can they be combined in the traditional logic of identity. In the poem, the inscriptions, images, and even spectacles function as *supplements*: they are at once additions and substitutes simultaneously bridging and widening the gap between God and the speaker. Some sense of the way in which supplementary logic differs from the binary logic of identity ($A = A$) and noncontradiction ($A \wedge \text{not } A$) may be derived from the following list. In this list, all statements are to be taken as *simultaneously* equivalent to the statement "A is a *supplement* to B." (In terms of the Taylor poem, say B = the presence of, or coincidence with, God; and A = writing).

- A is added to B.
- A substitutes for B.
- A is a superfluous addition to B.
- A makes up for the absence of B.
- A usurps the place of B.
- A makes up for B's deficiency.
- A corrupts the purity of B.
- A is necessary so that B can be restored.
- A is an accident alienating B from itself.
- A is that without which B would be lost.
- A is that through which B is lost.
- A is a danger to B.
- A is a remedy to B.
- A's fallacious charm seduces one away from B.
- A can never satisfy the desire for B.
- A protects against direct encounter with B.

Supplementary logic is not only the logic *of* writing - it is also a logic that can only really exist *in* writing. That is, it is a nonintuitive logic that inheres (Lacan

would say, "in-sists") in a text as a system of traces. Like an algebraic equation with more than one unknown, supplementary logic cannot be held in the head but must be worked out in external form. It is no accident that the word "differential" is central both to calculus and to Derrida's theory of writing.

Derrida's theory of writing turns out to have been, in fact, a theory of reading. The epigraph to his *Writing and Difference* is a quotation from Mallarmé: "Le tout sans nouveauté qu'un espacement de la lecture" ("All without innovation except for a certain spacing-out of reading"). What does it mean to introduce "space" into reading? For Mallarmé, it means two things. It means giving a signifying function to the materiality - the blanks, the typefaces, the placement on the page, the punctuation - of writing. And it also means tracking syntactic and semantic ambiguities in such a way as to generate multiple, often conflicting, meanings out of a single utterance. The "meaning" of a Mallarmé text, like that of a dream, cannot be grasped intuitively as a whole but must be worked out rigorously by following each strand in a network of relations. What Derrida generalizes and analyzes in other writings is this "spacing" that Mallarmé attempts to maximize. In his reading of Plato's *Phaedrus*, for instance, Derrida follows the ambiguity of the word *pharmakon*, which Plato uses to describe writing itself. If *pharmakon* can mean both "poison" and "remedy," what does it mean to call writing a *pharmakon*? As Derrida points out, translators of Plato have rendered this word by choosing to favor one side or the other of the ambiguity according to the context. They have subordinated its ambiguity to their notion of what makes the most sense. They have thus subordinated "writing" as spacing and ambiguity to "speech" as single intention. The ambiguity of the poison / remedy relation is tamed thereby into something far less unsettling. "Sense" is achieved, however, at a cost. To know the difference between poison and remedy may be reassuring, but that reassurance may well make it difficult to come to grips with the meaning of Socrates' death.

Thus "reading," for Derrida, involves following the "other" logics of structures of signification inscribed in writing that may or may not be in conformity with traditional logics of meaning, identity, consciousness, or intention. It involves taking seriously the elements that a standard reading disregards, overlooks, or edits out. Just as Freud rendered dreams and slips of the tongue *readable* rather than dismissing them as mere nonsense or error, so Derrida sees signifying force in the gaps, margins, figures, echoes, digressions, discontinuities, contradictions, and ambiguities of a text. When one writes, one writes more than (or less than, or other than) one thinks. The reader's task is to read what is written rather than simply attempt to intuit what might have been meant.

The possibility of reading materiality, silence, space, and conflict within texts has opened up extremely productive ways of studying the politics of language. If each text is seen as presenting a major claim that attempts to dominate, erase, or distort various "other" claims (whose traces nevertheless remain detectable to a reader who goes against the grain of the dominant claim), then "reading" in its extended sense is deeply involved in questions of authority and power. One field of conflict and domination in discourse that has been fruitfully studied in this sense is the field of sexual politics. Alice Jardine, in *Gynesis* (1985), points out that since logocentric logic has been coded as "male," the "other" logics of spacing, ambiguity, figuration, and indirection are often coded as "female," and that a critique of logocentrism can enable a critique of "phallogentrism" as well. A theory and practice of female writing (*écriture féminine*)

has been developed in France by such writers as Helene Cixous and Luce Irigaray, who have attempted to write the specificity of female biological and ideological difference. While Cixous, Irigaray, and others work on the relations between writing and the body, many feminists on both sides of the Atlantic have been interested in the gender implications of the relations between writing and silence. In *The Madwoman in the Attic* (1979), Sandra Gilbert and Susan Gubar show how nineteenth-century women writers struggle for authorship against the silence that has already been prescribed for them by the patriarchal language they must both use and transform. Adrienne Rich also explores the traces of women's silence in a collection of essays entitled *On Lies, Secrets, and Silence* (1979). These and other works have as their project the attempt to read the suppressed, distorted, or disguised messages that women's writing has encoded. They require a reading strategy that goes beyond apparent intentions or surface meanings, a reading that takes full advantage of writing's capacity to preserve that which cannot yet, perhaps, be deciphered.

The writings of Western male authorities have often encoded the silence, denigration, or idealization not only of women but also of other "others." Edward Said, in *Orientalism* (1978), analyzes the discursive fields of scholarship, art, and politics in which the "Oriental" is projected as the "other" of the European. By reading against the grain of the writers' intentions, he shows how European men of reason and benevolence could inscribe a rationale for oppression and exploitation within their very discourse of Enlightenment ____

The Newly Born Woman

Helene Cixous

Helene Cixous in *The Newly Born Woman* (1975), from which this selection is taken, helped to define "French feminism" for a generation of anglophone feminists. She is famous for advocating "feminine writing," a new paratactic style of expression that would give voice to all that Western rationalism has repressed. Drawing on Derrida's critique of metaphysics, Cixous describes the tradition of gender representation as an oppositional one in which all that connotes women is portrayed as being secondary to male rationalist principles. Interestingly, she argues that feminine writing is a practice that both men and women can engage in, and one of her most famous analyses is of Joyce's *Ulysses*.

Sorties: Out and Out: Attacks/Ways Out/Forays

Where is she?

Form, convex, step, advance, semen, progress

Matter, concave, ground - where steps are taken, holding- and dumping-ground

Man

Woman

Always the same metaphor: we follow it, it carries us, beneath all its figures, wherever discourse is organized. If we read or speak, the same thread or double braid is leading us throughout literature, philosophy, criticism, centuries of representation and reflection. Thought has always worked through opposition, Speaking/Writing, Parole/Ecriture, High/Low.

Through dual, hierarchical oppositions. Superior/Inferior. Myths, legends, books. Philosophical systems. Everywhere (where) ordering intervenes, where a law organizes what is thinkable by oppositions (dual, irreconcilable; or sublatale, dialectical). And all these pairs of oppositions are *couples*. Does that mean something? Is the fact

that Logocentrism subjects thought - all concepts, codes and values - to a binary system, related to "the" couple, man/woman?

Nature/History
Nature/Art
Nature/Mind
Passion/Action

Theory of culture, theory of society, symbolic systems in general - art, religion, family, language - it is all developed while bringing the same schemes to light. And the movement whereby each opposition is set up to make sense is the movement through which the couple is destroyed. A universal battlefield. Each time, a war is let loose. Death is always at work.

Father/son
Relations of authority, privilege, force.
The Word/Writing Relations: opposition, conflict, sublation, return.
Master/slave
Violence
Repression.

We see that "victory" always comes down to the same thing: things get hierarchical. Organization by hierarchy makes all conceptual organization subject to man. Male privilege, shown in the opposition between *activity* and *passivity*, which he uses to sustain himself. Traditionally, the question of sexual difference is treated by coupling it with the opposition: activity/passivity.

There are repercussions. Consulting the history of philosophy - since philosophical discourse both orders and reproduces all thought - one notices that it is marked by an absolute *constant* which orders values and which is precisely this opposition, activity/passivity.

Moreover, woman is always associated with passivity in philosophy. Whenever it is a question of woman, when one examines kinship structures, when a family model is brought into play. In fact, as soon as the question of ontology raises its head, as soon as one asks oneself "what is it?", as soon as there is intended meaning. Intention: desire, authority - examine them and you are led right back... to the father. It is even possible not to notice that there is no place whatsoever for woman in the calculations. Ultimately the world of being can function while precluding the mother. No need for a mother, as long as there is some motherliness: and it is the father, then, who acts the part, who is the mother. Either woman is passive or she does not exist. What is left of her is unthinkable, unthought. Which certainly means that she is not thought, that she does not enter into the oppositions, that she does not make a couple with the father (who makes a couple with the son).

There is Mallarmé's tragic dream, that father's lamentation on the mystery of paternity, that wrenches from the poet the mourning, the mourning of mournings, the death of the cherished son: this dream of marriage between father and son. -And there's no mother then. A man's dream when faced with death. Which always threatens him differently than it threatens a woman.

"a union
 a marriage, splendid
 - and with life
 still in me
 I shall use it
 for...
 so not mother then?"

And dreams of filiation
 that is masculine, dreams
 of God the father
 issuing from himself
 in his son - and
 no mother then

She does not exist, she can not be; but there has to be something of her. He keeps, then, of the woman on whom he is no longer dependent, only this space, always virginal, as matter to be subjected to the desire he wishes to impart.

And if we consult literary history, it is the same story. It all comes back to man -to *his* torment, his desire to be (at) the origin. Back to the father. There is an intrinsic connection between the philosophical and the literary (to the extent that it conveys meaning, literature is under the command of the philosophical) and the phallogocentric. Philosophy is constructed on the premise of woman's abasement. Subordination of the feminine to the masculine order, which gives the appearance of being the condition for the machinery's functioning.

Now it has become rather urgent to question this solidarity between logocentrism and phallogocentrism - bringing to light the fate dealt to woman, her burial - to threaten the stability of the masculine structure that passed itself off as eternal-natural, by conjuring up from femininity the reflections and hypotheses that are necessarily ruinous for the stronghold still in possession of authority. What would happen to logocentrism, to the great philosophical systems, to the order of the world in general if the rock upon which they founded this church should crumble?

If some fine day it suddenly came out that the logocentric plan had always, inadmissibly, been to create a foundation for (to found and fund) phallogocentrism, to guarantee the masculine order a rationale equal to history itself.

So all the history, all the stories would be there to retell differently; the future would be incalculable; the historic forces would and will change hands and change body - another thought which is yet unthinkable - will transform the functioning of all society. We are living in an age where the conceptual foundation of an ancient culture is in the process of being undermined by millions of a species of mole (*Topoi*, ground mines) never known before.

When they wake up from among the dead, from among words, from among laws
Once upon a time...

It is impossible to predict what will become of sexual difference - in another time (in two or three hundred years?). But we must make no mistake: men and women are caught up in a web of age-old cultural determinations that are almost unanalyzable in their complexity. One can no more speak of "woman" than of "man" without being trapped within an ideological theater where the proliferation of representations, images, reflections, myths, identifications, transform, deform, constantly change everyone's Imaginary and invalidate in advance any conceptualization.

Nothing allows us to rule out the possibility of radical transformation of behaviors, mentalities, roles, political economy - whose effects on libidinal economy are unthinkable - today. Let us simultaneously imagine a general change in all the structures of training, education, supervision - hence in the structures of reproduction of ideological results. And let us imagine a real liberation of sexuality, that is to say, a

transformation of each one's relationship to his or her body (and to the other body), an approximation to the vast, material, organic, sensuous universe that we are. This cannot be accomplished, of course, without political transformations that are equally radical. (Imagine!) Then "femininity" and "masculinity" would inscribe quite differently their effects of difference, their economy, their relationship to expenditure, to lack, to the gift. What today appears to be "feminine" or "masculine" would no longer amount to the same thing. No longer would the common logic of difference be organized with the opposition that remains dominant. Difference would be a bunch of new differences.

But we are still floundering - with few exceptions - in Ancient History.

The Masculine Future

There are some exceptions. There have always been those uncertain, poetic persons who have not let themselves be reduced to dummies programmed by pitiless repression of the homosexual element. Men or women: beings who are complex, mobile, open. Accepting the other sex as a component makes them much richer, more various, stronger, and - to the extent that they are mobile - very fragile. It is only in this condition that we invent. Thinkers, artists, those who create new values, "philosophers" in the mad Nietzschean manner, inventors and wreckers of concepts and forms, those who change life cannot help but be stirred by anomalies - complementary or contradictory. That doesn't mean that you have to be homosexual to create. But it does mean that there is no *invention* possible, whether it be philosophical or poetic, without there being in the inventing subject an abundance of the other, of variety: separate-people, thought-/people, whole populations issuing from the unconscious, and in each suddenly animated desert, the springing up of selves one didn't know - our women, our monsters, our jackals, our Arabs, our aliases, our frights. That there is no invention of any other I, no poetry, no fiction without a certain homosexuality (the I/play of bisexuality) acting as a crystallization of my ultrasubjectivities. I is this exuberant, gay, personal matter, masculine, feminine or other where I enchants, I agonizes me. And in the concert of personalizations called I, at the same time that a certain homosexuality is repressed, symbolically, substitutively, it comes through by various signs, conduct-character, behavior-acts. And it is even more clearly seen in writing.

Thus, what is inscribed under Jean Genet's name, in the movement of a text that divides itself, pulls itself to pieces, dismembers itself, regroupes, remembers itself, is a proliferating, maternal femininity. A phantasmic meld of men, males, gentlemen, monarchs, princes, orphans, flowers, mothers, breasts gravitates about a wonderful "sun of energy" - love, - that bombards and disintegrates these ephemeral amorous anomalies so that they can be recomposed in other bodies for new passions.

She is bisexual:

What I propose here leads directly to a reconsideration of *bisexuality*. To reassert the value of bisexuality; hence to snatch it from the fate classically reserved for it in which it is conceptualized as "neuter" because, as such, it would aim at warding off castration. Therefore, I shall distinguish between two bisexualities, two opposite ways of imagining the possibility and practice of bisexuality.

1 Bisexuality as a fantasy of a complete being, which replaces the fear of castration and veils sexual difference insofar as this is perceived as the mark of a mythical

separation - the trace, therefore, of a dangerous and painful ability to be cut. Ovid's Hermaphrodite, less bisexual than asexual, not made up of two genders but of two halves. Hence, a fantasy of unity. Two within one, and not even two wholes.

2 To this bisexuality that melts together and effaces, wishing to avert castration I oppose the *other bisexuality*, the one with which every subject, who is not shut up inside the spurious Phallogocentric Performing Theater, sets up his or her erotic universe. Bisexuality - that is to say the location within oneself of the presence of both sexes, evident and insistent in different ways according to the individual, the nonexclusion of difference or of a sex, and starting with this "permission" one gives oneself, the multiplication of the effects of desire's inscription on every part of the body and the other body.

For historical reasons, at the present time it is woman who benefits from and opens up within this bisexuality beside itself, which does not annihilate differences but cheers them on, pursues them, adds more: in a certain way *woman is bisexual* - man having been trained to aim for glorious phallic monosexuality. By insisting on the primacy of the phallus and implementing it, phallogocentric ideology has produced more than one victim. As a woman, I could be obsessed by the scepter's great shadow, and they told me: adore it, that thing you don't wield.

But at the same time, man has been given the grotesque and unenviable fate of being reduced to a single idol with clay balls. And terrified of homosexuality, as Freud and his followers remark. Why does man fear *being* a woman? Why this refusal (*Ablehnung*) of femininity? The question that stumps Freud. The "bare rock" of castration. For Freud, the repressed is not the other sex defeated by the dominant sex, as his friend Fliess (to whom Freud owes the theory of bisexuality) believed; what is repressed is leaning toward one's own sex.

Psychoanalysis is formed on the basis of woman and has repressed (not all that successfully) the femininity of masculine sexuality, and now the account it gives is hard to disprove.

We women, the derangers, know it only too well. But nothing compels us to deposit our lives in these lack-banks; to think that the subject is constituted as the last stage in a drama of bruising rehearsals; to endlessly bail out the father's religion. Because we don't desire it. We don't go round and round the supreme hole. We have no *woman's* reason to pay allegiance to the negative. What is feminine (the poets suspected it) affirms:... and yes I said yes I will Yes, says Molly (in her rapture); carrying *Ulysses* with her in the direction of a new writing; I said yes, I will. Yes.

To say that woman is somehow bisexual is an apparently paradoxical way of displacing and reviving the question of difference. And therefore of writing as "feminine" or "masculine."

I will say: today writing is woman's. That is not a provocation, it means that woman admits there is an other. In her becoming-woman she has not erased the bisexuality latent in the girl as in the boy. Femininity and bisexuality go together in a combination that varies according to the individual, spreading the intensity of its force differently and (depending on the moments of their history) privileging one component or another. It is much harder for man to let the other come through him. Writing is the passageway, the entrance, the exit, the dwelling place of the other in me - the other that I am and am not, that I don't know how to be, but that I feel passing, that makes me live - that tears me apart, disturbs me, changes me, who? - a feminine one, a masculine one, some? - several, some unknown, which is indeed

what gives me the desire to know and from which all life soars. This peopling gives neither rest nor security, always disturbs the relationship to "reality," produces an uncertainty that gets in the way of the subject's socialization. It is distressing, it wears you out; and for men this permeability, this nonexclusion is a threat, something intolerable.

In the past, when carried to a rather spectacular degree, it was called "possession." Being possessed is not desirable for a masculine Imaginary, which would interpret it as passivity - a dangerous feminine position. It is true that a certain receptivity is "feminine." One can, of course, as History has always done, exploit feminine reception through alienation. A woman, by her opening up, is open to being "possessed," which is to say, dispossessed of herself.

But I am speaking here of femininity as keeping alive the other that is confided to her, that visits her, that she can love as other. The loving to be other, another, without its necessarily going the route of abasing what is same, herself.

As for passivity, in excess, it is partly bound up with death. But there is a nonclosure that is not submission but confidence and comprehension; that is not an opportunity for destruction but for wonderful expansion.

Through the same opening that is her danger, she comes out of herself to go to the other, a traveler in unexplored places; she does not refuse, she approaches, not to do away with the space between, but to see it, to experience what she is not, what she is, what she can be.

Writing is working; being worked; questioning (in) the between (letting oneself be questioned) of same *and of* other without which nothing lives; undoing death's work by willing the togetherness of one-another, infinitely charged with a ceaseless exchange of one with another - not knowing one another and beginning again only from what is most distant, from self, from other, from the other within. A course that multiplies transformations by the thousands ...

If there is a self proper to woman, paradoxically it is her capacity to deappropriate herself without self-interest: endless body, without "end," without principal "parts"; if she is a whole, it is a whole made up of parts that are wholes, not simple, partial objects but varied entirety, moving and boundless change, a cosmos where eros never stops traveling, vast astral space. She doesn't revolve around a sun that is more star than the stars.

That doesn't mean that she is undifferentiated magma; it means that she doesn't create a monarchy of her body or her desire. Let masculine sexuality gravitate around the penis, engendering this centralized body (political anatomy) under the party dictatorship. Woman does not perform on herself this regionalization that profits the couple head-sex, that only inscribes itself within frontiers. Her libido is cosmic, just as her unconscious is worldwide: her writing also can only go on and on, without ever inscribing or distinguishing contours, daring these dizzying passages in other, fleeting and passionate dwellings within him, within the hims and hers whom she inhabits just long enough to watch them, as close as possible to the unconscious from the moment they arise; to love them, as close as possible to instinctual drives, and then, further, all filled with these brief identifying hugs and kisses, she goes and goes on infinitely. She alone dares and wants to know from within where she, the one excluded, has never ceased to hear what-comes-before-language reverberating. She lets the other tongue of a thousand tongues speak - the tongue, sound without barrier or death. She refuses life nothing. Her tongue doesn't hold back but holds

forth, doesn't keep in but keeps on enabling. Where the wonder of being several and turmoil is expressed, she does not protect herself against these unknown feminines; she surprises herself at seeing, being, pleasuring in her gift of changeability. I am spacious singing Flesh: onto which is grafted no one knows which I - which masculine or feminine, more or less human but above all living, because changing I.

Notes

- 1 All Derrida's work traversing-detecting the history of philosophy is devoted to bringing this to light. In Plato, Hegel, and Nietzsche, the same process continues: repression, repudiation, distancing of woman, a murder that is mixed up with history as the manifestation and representation of masculine power.
- 2 "For Anatole's Tomb" (Seuil, p. 138). This is the tomb in which Mallarme keeps his son from death and watches over him as his mother.
- 3 There are encoded paradigms projecting the robot couple man/woman, as seen by contemporary societies that are symptomatic of a consensus of repetition. See the UNESCO issue of 1974, which is devoted to the International Woman's Year.

The Postmodern Condition

Jean-Francois Lyotard

Jean-Francois Lyotard's *The Post-Modern Condition* (1979) announced a new moment in cultural history called "Post-Modernism." Post-Modernism is skeptical regarding reason, sees technology as an instrument as much of destruction as of progress, and rejects the premises of industrial society. Lyotard also characterizes Post-Modernism as a skepticism toward what he calls "metanarratives." By that, he means stories about the world that strive to sum it all up in one account. The Post-Modern temperament finds such conclusive stories unsuited to the world. Instead, according to Lyotard, Post-Modernism favors seeing the world in more rhetorical terms as a field of contending smaller narratives, where people strive to make their point of view and their interests paramount by making their narratives more convincing.

Post-Modernism is faulted for not taking a stand on issues of value. All values are topics of debate, and the debate should, according to Lyotard, continue endlessly. The only wrong consists of closing off debate. Values, its detractors contend, must be decided. And while all issues or problems facing society can be endlessly debated, at some point decisions need to be made regarding what values shall prevail. According to Lyotard, many such decisions are indeed made, but they usually consist of an assertion of non-rhetorical power by those in a dominant position materially in society. And such decisions always close off debate and preclude further story-telling, further rhetorical contest.

The object of this study is the condition of knowledge in the most highly developed societies. I have decided to use the word *postmodern* to describe that condition. The word is in current use on the American continent among sociologists and critics; it designates the state of our culture following the transformations which, since the end of the nineteenth century, have altered the game rules for science, literature, and the arts. The present study will place these transformations in the context of the crisis of narratives.

Science has always been in conflict with narratives. Judged by the yardstick of science, the majority of them prove to be fables. But to the extent that science does not restrict itself to stating useful regularities and seeks the truth, it is obliged to legitimate the rules of its own game. It then produces a discourse of legitimation with respect to its own status, a discourse called philosophy. I will use the term modern to designate any science that legitimates itself with reference to a metadiscourse of this kind making an explicit appeal to some grand narrative, such as the dialectics of Spirit, the hermeneutics of meaning, the emancipation of the rational or working subject, or the creation of wealth.¹ For example, the rule of consensus between the sender and addressee of a statement with truth-value is

deemed acceptable if it is cast in terms of a possible unanimity between rational minds: this is the Enlightenment narrative, in which the hero of knowledge works toward a good ethico-political end - universal peace. As can be seen from this example, if a metanarrative implying a philosophy of history is used to legitimate knowledge, questions are raised concerning the validity of the institutions governing the social bond: these must be legitimated as well. Thus justice is consigned to the grand narrative in the same way as truth.

Simplifying to the extreme, I define *postmodern* as incredulity toward metanarratives. This incredulity is undoubtedly a product of progress in the sciences: but that progress in turn presupposes it. To the obsolescence of the metanarrative apparatus of legitimation corresponds, most notably, the crisis of metaphysical philosophy and of the university institution which in the past relied on it. The narrative function is losing its functors, its great hero, its great dangers, its great voyages, its great goal. It is being dispersed in clouds of narrative language elements - narrative, but also denotative, prescriptive, descriptive, and so on. Conveyed within each cloud are pragmatic valencies specific to its kind. Each of us lives at the intersection of many of these. However, we do not necessarily establish stable language combinations, and the properties of the ones we do establish are not necessarily communicable.

Thus the society of the future falls less within the province of a Newtonian anthropology (such as structuralism or systems theory) than a pragmatics of language particles. There are many different language games - a heterogeneity of elements. They only give rise to institutions in patches - local determinism.

The decision makers, however, attempt to manage these clouds of sociality according to input/output matrices, following a logic which implies that their elements are commensurable and that the whole is determinable. They allocate our lives for the growth of power. In matters of social justice and of scientific truth alike, the legitimation of that power is based on its optimizing the system's performance - efficiency. The application of this criterion to all of our games necessarily entails a certain level of terror, whether soft or hard: be operational (that is, commensurable) or disappear.

The logic of maximum performance is no doubt inconsistent in many ways, particularly with respect to contradiction in the socio-economic field: it demands both less work (to lower production costs) and more (to lessen the social burden of the idle population). But our incredulity is now such that we no longer expect salvation to rise from these inconsistencies, as did Marx.

Still, the postmodern condition is as much a stranger to disenchantment as it is to the blind positivity of delegitimation. Where, after the metanarratives, can legitimacy reside? The operativity criterion is technological; it has no relevance for judging what is true or just. Is legitimacy to be found in consensus obtained through discussion, as Jürgen Habermas thinks? Such consensus does violence to the heterogeneity of language games. And invention is always born of dissension. Postmodern knowledge is not simply a tool of the authorities; it refines our sensitivity to differences and reinforces our ability to tolerate the incommensurable. Its principle is not the expert's homology, but the inventor's paralogy.

Here is the question: is a legitimation of the social bond, a just society, feasible in terms of a paradox analogous to that of scientific activity? What would such a paradox be?...

Narratives of the Legitimation of Knowledge

We shall examine two major versions of the narrative of legitimation. One is more political, the other more philosophical; both are of great importance in modern history, in particular in the history of knowledge and its institutions.

The subject of the first of these versions is humanity as the hero of liberty. All peoples have a right to science. If the social subject is not already the subject of scientific knowledge, it is because that has been forbidden by priests and tyrants. The right to science must be reconquered. It is understandable that this narrative would be directed more toward a politics of primary education, rather than of universities and high schools. The educational policy of the French Third Republic (1871-1940) powerfully illustrates these presuppositions.

It seems that this narrative finds it necessary to de-emphasize higher education. Accordingly, the measures adopted by Napoleon regarding higher education are generally considered to have been motivated by the desire to produce the administrative and professional skills necessary for the stability of the State.³ This overlooks the fact that in the context of the narrative of freedom, the State receives its legitimacy not from itself but from the people. So even if imperial politics designated the institutions of higher education as a breeding ground for the officers of the State and secondarily, for the managers of civil society, it did so because the nation as a whole was supposed to win its freedom through the spread of new domains of knowledge to the population, a process to be effected through agencies and professions within which those cadres would fulfill their functions. The same reasoning is a fortiori valid for the foundation of properly scientific institutions. The State resorts to the narrative of freedom every time it assumes direct control over the training of the "people," under the name of the "nation," in order to point them down the path of progress.⁴...

But, as I have said, the problem of legitimacy can be solved using the other procedures as well. The difference between them should be kept in mind: today, with the status of knowledge unbalanced and its speculative unity broken, the first version of legitimacy is gaining new vigor.

According to this version, knowledge finds its validity not within itself, not in a subject that develops by actualizing its learning possibilities, but in a practical subject - humanity. The principle of the movement animating the people is not the self-legitimation of knowledge, but the self-grounding of freedom or, if preferred, its self-management. The subject is concrete, or supposedly so, and its epic is the story of its emancipation from everything that prevents it from governing itself. It is assumed that the laws it makes for itself are just, not because they conform to some outside nature, but because the legislators are, constitutionally, the very citizens who are subject to the laws. As a result, the legislator's will - the desire that the laws be just - will always coincide with the will of the citizen, who desires the law and will therefore obey it.

Clearly, this mode of legitimation through the autonomy of the will⁵ gives priority to a totally different language game, which Kant called imperative and is known today as prescriptive. The important thing is not, or not only, to legitimate denotative utterances pertaining to the truth, such as "The earth revolves around the sun," but rather to legitimate prescriptive utterances pertaining to justice, such as "Carthage must be destroyed" or "The minimum wage must be set at x dollars." In this

context, the only role positive knowledge can play is to inform the practical subject about the reality within which the execution of the prescription is to be inscribed. It allows the subject to circumscribe the executable, or what it is possible to do. But the executory, what should be done, is not within the purview of positive knowledge. It is one thing for an undertaking to be possible and another for it to be just. Knowledge is no longer the subject, but in the service of the subject: its only legitimacy (though it is formidable) is the fact that it allows morality to become reality.

This introduces a relation of knowledge to society and the State which is in principle a relation of the means to the end. But scientists must cooperate only if they judge that the politics of the State, in other words the sum of its prescriptions, is just. If they feel that the civil society of which they are members is badly represented by the State, they may reject its prescriptions. This type of legitimation grants them the authority, as practical human beings, to refuse their scholarly support to a political power they judge to be unjust, in other words, not grounded in a real autonomy. They can even go so far as to use their expertise to demonstrate that such autonomy is not in fact realized in society and the State. This reintroduces the critical function of knowledge. But the fact remains that knowledge has no final legitimacy outside of serving the goals envisioned by the practical subject, the autonomous collectivity.

This distribution of roles in the enterprise of legitimation is interesting from our point of view because it assumes, as against the system-subject theory, that there is no possibility that language games can be unified or totalized in any metadiscourse. Quite to the contrary, here the priority accorded prescriptive statements - uttered by the practical subject - renders them independent in principle from the statements of science, whose only remaining function is to supply this subject with information.

Two remarks:

1 It would be easy to show that Marxism has wavered between the two models of narrative legitimation I have just described. The Party takes the place of the University, the proletariat that of the people or of humanity, dialectical materialism that of speculative idealism, etc. Stalinism may be the result, with its specific relationship with the sciences: in Stalinism, the sciences only figure as citations from the metanarrative of the march towards socialism, which is the equivalent, of the life of the spirit. But on the other hand Marxism can, in conformity to the second version, develop into a form of critical knowledge by declaring that socialism is nothing other than the constitution of the autonomous subject and that the only justification for the sciences is if they give the empirical subject (the proletariat) the means to emancipate itself from alienation and repression: this was, briefly, the position of the Frankfurt School.

2 The speech Heidegger gave on May 27, 1933, on becoming rector of the university of Freiburg-in-Breisgau,⁷ can be read as an unfortunate episode in the history of legitimation. (Heidegger became rector after joining the Nazi Party, as was required by law. He openly supported National Socialism.) Here, speculative science has become the questioning of being. This questioning is the "destiny" of the German people, dubbed an "historico-spiritual people." To this subject are owed the three services of labor, defense, and knowledge. The University guarantees a metaknowledge of the three services, that is to say, science. Here, as in idealism, legitimation is achieved through a metadiscourse called science, with ontological pretensions. But here the metadiscourse is questioning, not totalizing. And the University, the home of this metadiscourse, owes its knowledge to a people whose "historic mission" is to

bring that metadiscourse to fruition by working, fighting, and knowing. The calling of this people-subject is not to emancipate humanity, but to realize its "true world of the spirit," which is "the most profound power of conservation to be found within its forces of earth and blood." This insertion of the narrative of race and work into that of the spirit as a way of legitimating knowledge and its institutions is doubly unfortunate: theoretically inconsistent, it was compelling enough to find disastrous echoes in the realm of politics.

Delegitimation

In contemporary society and culture - postindustrial society, postmodern culture - the question of the legitimation of knowledge is formulated in different terms. The grand narrative has lost its credibility, regardless of what mode of unification it uses, regardless of whether it is a speculative narrative or a narrative of emancipation.

The decline of narrative can be seen as an effect of the blossoming of techniques and technologies since the Second World War, which has shifted emphasis from the ends of action to its means; it can also be seen as an effect of the redeployment of advanced liberal capitalism after its retreat under the protection of Keynesianism during the period 1930-60, a renewal that has eliminated the communist alternative and valorized the individual enjoyment of goods and services.

Anytime we go searching for causes in this way we are bound to be disappointed. Even if we adopted one or the other of these hypotheses, we would still have to detail the correlation between the tendencies mentioned and the decline of the unifying and legitimating power of the grand narratives of speculation and emancipation.

It is, of course, understandable that both capitalist renewal and prosperity and the disorienting upsurge of technology would have an impact on the status of knowledge. But in order to understand how contemporary science could have been susceptible to those effects long before they took place, we must first locate the seeds of "delegitimation" and nihilism that were inherent in the grand narratives of the nineteenth century....

The potential for erosion intrinsic to the other legitimation procedure, the emancipation apparatus flowing from the *Aufklärung* (Enlightenment), is no less extensive than the one at work within speculative discourse. But it touches a different aspect. Its distinguishing characteristic is that it grounds the legitimation of science and truth in the autonomy of interlocutors involved in ethical, social, and political praxis. As we have seen, there are immediate problems with this form of legitimation: the difference between a denotative statement with cognitive value and a prescriptive statement with practical value is one of relevance therefore of competence. There is nothing to prove that if a statement describing a real situation is true, it follows that a prescriptive statement based upon it (the effect of which will necessarily be a modification of that reality) will be just.

Take, for example, a closed door. Between "The door is closed" and "Open the door" there is no relation of consequence as defined in propositional logic. The two statements belong to two autonomous sets of rules defining different kinds of relevance, and therefore of competence. Here, the effect of dividing reason into cognitive or theoretical reason on the one hand, and practical reason on the other, is to attack the legitimacy of the discourse of science. Not directly, but indirectly, by revealing

that it is a language game with its own rules (of which the a priori conditions of knowledge in Kant provide a first glimpse) and that it has no special calling to supervise the game of praxis (nor the game of aesthetics, for that matter). The game of science is thus put on a par with the others.

If this "delegitimation" is pursued in the slightest and if its scope is widened (as Wittgenstein does in his own way, and thinkers such as Martin Buber and Emmanuel Levinas in theirs) the road is then open for an important current of postmodernity: science plays its own game; it is incapable of legitimating the other language games. The game of prescription, for example, escapes it. But above all, it is incapable of legitimating itself, as speculation assumed it could.

The social subject itself seems to dissolve in this dissemination of language games. The social bond is linguistic, but is not woven with a single thread. It is a fabric formed by the intersection of at least two (and in reality an indeterminate number) of language games, obeying different rules. Wittgenstein writes: "Our language can be seen as an ancient city: a maze of little streets and squares, of old and new houses, and of houses with additions from various periods; and this surrounded by a multitude of new boroughs with straight regular streets and uniform houses." And to drive home that the principle of unitotality - or synthesis under the authority of a metadiscourse of knowledge - is inapplicable, he subjects the "town" of language to the old sorites paradox by asking: "how many houses or streets does it take before a town begins to be a town?"

New languages are added to the old ones, forming suburbs of the old town: "the symbolism of chemistry and the notation of the infinitesimal calculus." Thirty-five years later we can add to the list: machine languages, the matrices of game theory, new systems of musical notation, systems of notation for nondenotative forms of logic (temporal logics, denotic logics, modal logics), the language of the genetic code, graphs of phonological structures, and so on.

We may form a pessimistic impression of this splintering: nobody speaks all of those languages, they have no universal metalanguage, the project of the system-subject is a failure, the goal of emancipation has nothing to do with science, we are all stuck in the positivism of this or that discipline of learning, the learned scholars have turned into scientists, the diminished tasks of research have become compartmentalized and no one can master them all. Speculative or humanistic philosophy is forced to relinquish its legitimation duties, which explains why philosophy is facing a crisis wherever it persists in arrogating such functions and is reduced to the study of systems of logic or the history of ideas where it has been realistic enough to surrender them.¹⁶

Turn-of-the-century Vienna was weaned on this pessimism: not just artists such as Musil, Kraus, Hofmannsthal, Loos, Schonberg, and Broch, but also the philosophers Mach and Wittgenstein.¹⁷ They carried awareness of and theoretical and artistic responsibility for delegitimation as far as it could be taken. We can say today that the mourning process has been completed. There is no need to start all over again. Wittgenstein's strength is that he did not opt for the positivism that was being developed by the Vienna Circle, but outlined in his investigation of language games a kind of legitimation not based on performativity. That is what the postmodern world is all about. Most people have lost the nostalgia for the lost narrative. It in no way follows that they are reduced to barbarity. What saves them from it is their knowledge that legitimation can only spring from their own linguistic practice and

communicational interaction. Science "smiling into its beard" at every other belief has taught them the harsh austerity of realism.¹⁹ ...

Capitalism solves the scientific problem of research funding in its own way: directly by financing research departments in private companies, in which demands for performativity and recommercialization orient research first and foremost toward technological "applications"; and indirectly by creating private, state, or mixed-sector research foundations that grant program subsidies to university departments, research laboratories, and independent research groups with no expectation of an immediate return on the results of the work - this is done on the theory that research must be financed at a loss for a certain length of time in order to increase the probability of its yielding a decisive, and therefore highly profitable, innovation. Nation-states, especially in their Keynesian period, follow the same rule: applied research on the one hand, basic research on the other. They collaborate with corporations through an array of agencies. The prevailing corporate norms of work management spread to the applied science laboratories: hierarchy, centralized decision making, teamwork, calculation of individual and collective returns, the development of saleable programs, market research, and so on. Centers dedicated to "pure" research suffer from this less, but also receive less funding.

The production of proof, which is in principle only part of an argumentation process designed to win agreement from the addressees of scientific messages, thus falls under the control of another language game, in which the goal is no longer truth, but performativity - that is, the best possible input/output equation. The State and/or company must abandon the idealist and humanist narratives of legitimation in order to justify the new goal: in the discourse of today's financial backers of research, the only credible goal is power. Scientists, technicians, and instruments are purchased not to find truth, but to augment power.

The question is to determine what the discourse of power consists of and if it can constitute a legitimation. At first glance, it is prevented from doing so by the traditional distinction between force and right, between force and wisdom - in other words, between what is strong, what is just, and what is true. I referred to this incommensurability earlier in terms of the theory of language games, when I distinguished the denotative game (in which what is relevant is the true/false distinction) from the prescriptive game (in which the just/unjust distinction pertains) from the technical game (in which the criterion is the efficient/inefficient distinction). "Force" appears to belong exclusively to the last game, the game of technology. I am excluding the case in which force operates by means of terror. This lies outside the realm of language games, because the efficacy of such force is based entirely on the threat to eliminate the opposing player, not on making a better "move" than he. Whenever efficiency (that is, obtaining the desired effect) is derived from a "Say or do this, or else you'll never speak again," then we are in the realm of terror, and the social bond is destroyed.

But the fact remains that since performativity increases the ability to produce proof, it also increases the ability to be right: the technical criterion, introduced on a massive scale into scientific knowledge, cannot fail to influence the truth criterion. The same has been said of the relationship between justice and performance: the probability that an order would be pronounced just was said to increase with its chances of being implemented, which would in turn increase with the performance capability of the prescriber. This led Luhmann to hypothesize that in postindustrial societies the normativity of laws is replaced by the performativity of procedures.

"Context control," in other words, performance improvement won at the expense of the partner or partners constituting that context (be they "nature" or men), can pass for a kind of legitimation. De facto legitimation.

This procedure operates within the following framework: since "reality" is what provides the evidence used as proof in scientific argumentation, and also provides prescriptions and promises of a juridical, ethical, and political nature with results, one can master all of these games by mastering "reality." That is precisely what technology can do. By reinforcing technology, one "reinforces" reality, and one's chances of being just and right increase accordingly. Reciprocally, technology is reinforced all the more effectively if one has access to scientific knowledge and decision-making authority.

This is how legitimation by power takes shape. Power is not only good performativity, but also effective verification and good verdicts. It legitimates science and the law on the basis of their efficiency, and legitimates this efficiency on the basis of science and law. It is self-legitimizing, in the same way a system organized around performance maximization seems to be. Now it is precisely this kind of context control that a generalized computerization of society may bring. The performativity of an utterance, be it denotative or prescriptive, increases proportionally to the amount of information about its referent one has at one's disposal. Thus the growth of power, and its self-legitimation, are now taking the route of data storage and accessibility, and the operativity of information.

The relationship between science and technology is reversed. The complexity of the argumentation becomes relevant here, especially because it necessitates greater sophistication in the means of obtaining proof, and that in turn benefits performativity. Research funds are allocated by States, corporations, and nationalized companies in accordance with this logic of power growth. Research sectors that are unable to argue that they contribute even indirectly to the optimization of the system's performance are abandoned by the flow of capital and doomed to senescence. The criterion of performance is explicitly invoked by the authorities to justify their refusal to subsidize certain research centers.

Notes

- 1 These grand narratives are what Lyotard calls "metanarratives," philosophical stories which legitimate all other discourse.
- 2 A trace of this politics is to be found in the French institution of a philosophy class at the end of secondary studies, and in the proposal by the Groupe de recherches sur l'enseignement de la philosophic (GREPH) to teach "some" philosophy starting at the beginning of secondary studies: see their *Qui a peur de la philosophie?* (Paris: Flammarion, 1977), sec. 2, "La Philosophic declassee." This also seems to be the orientation of the curriculum of the CEGEP's in Quebec, especially of the philosophy courses (see for example the *Cahiers de l'enseignement collegial* (1975-76) for philosophy).
- 3 See H. Janne, "L'Universite et les besoins de la societe contemporaine," *Cahiers de l'Association internationale des Universites*, 10 (1970): 5; quoted by the Commission d'etude sur les universites, *Document de consultation* (Montreal, 1978).
- 4 A "hard," almost mystico-military expression of this can be found in Julio de Mesquita Filho, *Discurso de Parainfo da primeiro turma de licenciados pela Faculdade de Filosofia, Ciencias e Letras da Universidade de Sao Paulo* (25 January 1937), and an expression of it adapted to the modern

- problems of Brazilian development in the *Relatorio do Grupo de Rabalho, Reforma Universitaria* (Brasilia: Ministries of Education and Culture, etc., 1968). These documents are part of a dossier on the university in Brazil, kindly sent to me by Helena C. Chamlian and Martha Ramos de Carvalho of the University of Sao Paulo.
- 5 Its principle is Kantian, at least in matters of transcendental ethics - see the *Critique of Practical Reason*. When it comes to politics and empirical ethics, Kant is prudent: since no one can identify himself with the transcendental normative subject, it is theoretically more exact to compromise with the existing authorities. See for example, "Antwort an der Frage: 'Was ist "Aufklarung"?"' (1784) [English trans. Lewis White Beck, in *Critique of Practical Reason and Other Writings in Moral Philosophy* (Chicago: Chicago University Press, 1949)].
 - 6 See Kant, "Antwort"; Jtirgen Habermas, *Strukturwandel der Offentlichkeit* (Frankfurt: Luchterhand, 1962) [*The Structural Transformation of the Public Sphere: An Inquiry into a Category of Bourgeois Society*, trans. Thomas Burger and Frederick Lawrence (Cambridge, Mass.: MIT, 1989)]. The principle of Offentlichkeit ("public" or "publicity" in the sense of "making public a private correspondence" or "public debate") guided the action of many groups of scientists at the end of the 1960s, especially the group "Survivre" (France), the group "Scientists and Engineers for Social and Political Action" (USA), and the group "British Society for Social Responsibility in Science."

- 19 "Science Smiling into its Beard" is the title of chap. 72, vol. 1 of Musil's *The Man Without Qualities*. Cited and discussed by J. Bouveresse, "La Problematique du sujet".
- 20 This was one of Lazarsfeld's conditions for agreeing to found what was to become the Mass Communication Research Center at Princeton in 1937. This produced some tension: the radio industries refused to invest in the project; people said that Lazarsfeld started things going but finished nothing. Lazarsfeld himself said to Morrison, "I usually put things together and hoped they worked." Quoted by D. Morrison, "The Beginning of Modern Mass Communication Research," *Archives europeennes de sociologie*, 19, no. 2 (1978): 347-59.
- 21 John Maynard Keynes (1883-1946), English economist, proposed increased government spending to stimulate economic activity.
- 22 In the United States, the funds allocated to research and development by the federal government were, in 1956, equal to the funds coming from private capital; they have been higher since that time (OCDE, 1956).
- 23 Robert Nisbet, *Degradation*, ch. 5, provides a bitter description of the penetration of "higher capitalism" into the university in the form of research centers independent of departments. The social relations in such centers disturb the academic tradition. See too in (*Auto*) *critique de la science*, the chapters "Le proletariat scientifique," "Les chercheurs," "La Crise des mandarins."
- 24 Niklas Luhmann (a contemporary German sociologist), *Legitimation durch Verfahren* (Neuwied: Luchterhand, 1969).
- 25 Commenting on Luhmann, Mueller writes, "In advanced industrial society legal-rational legitimation is replaced by a technocratic legitimation that does not accord any significance to the beliefs of the citizen or to morality per se" (*Politics of Communication*, p. 135). There is a bibliography of German material on the technocratic question in Habermas, *Theory and Practice*.
- 26 GiUes Fauconnier gives a linguistic analysis of the control of truth in "Comment contrôler la vérité? Remarques illustrées par des assertions dangereuses et pernicieuses en tout genre," *Actes de la recherche en sciences sociales*, 25 (1979): 1-22.
- 27 Thus in 1970 the British University Grants Committee was "persuaded to take a much more positive role in productivity, specialization, concentration of subjects, and control of building through cost limits" [*The Politics of Education: Edward Boyle and Anthony Crosland in Conversation with Maurice Kogan* (Harmondsworth, Eng.: Penguin, 1971), p. 196]. This may appear to contradict declarations such as that of Brooks, quoted above (note 52). But (1) the "strategy" may be liberal and the "tactics" authoritarian, as Edwards says elsewhere; (2) responsibility within the hierarchy of public authorities is often taken in its narrowest sense, namely the capacity to answer for the calculable performance of a project; (3) public authorities are not always free from pressures from private groups whose performance criterion is immediately binding. If the chances of innovation in research cannot be calculated, then public interest seems to lie in aiding all research, under conditions other than that of efficiency assessment after a fixed period.

Simulacra and Simulations

Jean Baudrillard

Sociologist Jean Baudrillard began his work on culture by studying the semiotics of advertising and consumption. He noted that reality was being increasingly replaced by sign systems that recodified and replaced the real. Instead of real cars or refrigerators, we come instead, under a regime of controlled consumption shaped by marketing and advertising, to consume signs of status or of self-identity. In his 1976 book, *Symbolic Exchange and Death*, for example, he argues that cultural history since the Renaissance can be reconceived as a successive series of simulacral regimes, ways of replacing the world with increasingly powerful regimes of signification. In a deconstructive mode, Baudrillard argues that eventually in contemporary times, the referent disappears altogether and people come to live in pure simulations, replications of reality that resemble it in all respects save they are representations through and through. In Baudrillard's perhaps most famous assertion regarding such simulations, he maintained that events like the Gulf War of 1990 "did not happen." In those events, reality was so shaped by the media and so replaced by representations that the events might as well have not happened. All that people "knew" or "experienced" of them came to them through carefully controlled images. The following selection, "Simulacra and Simulations," was published in 1981.

The simulacrum is never that which conceals the truth - it is the truth which conceals that there is none. The simulacrum is true.

Ecclesiastes

If we were able to take as the finest allegory of simulation the Borges tale where the cartographers of the Empire draw up a map so detailed that it ends up exactly covering the territory (but where, with the decline of the Empire this map becomes frayed and finally ruined, a few shreds still discernible in the deserts - the metaphysical beauty of this ruined abstraction, bearing witness to an imperial pride and rotting like a carcass, returning to the substance of the soil, rather as an aging double ends up being confused with the real thing), this fable would then have come full circle for us, and now has nothing but the discrete charm of second-order simulacra.

Abstraction today is no longer that of the map, the double, the mirror or the concept. Simulation is no longer that of a territory, a referential being or a substance. It is the generation by models of a real without origin or reality: a hyperreal. The territory no longer precedes the map, nor survives it. Henceforth, it is the map that

precedes the territory - *precession of simulacra* - it is the map that engenders the territory and if we were to revive the fable today, it would be the territory whose shreds are slowly rotting across the map. It is the real, and not the map, whose vestiges subsist here and there, in the deserts which are no longer those of the Empire, but our own. *The desert of the real itself*.

In fact, even inverted, the fable is useless. Perhaps only the allegory of the Empire remains. For it is with the same imperialism that present-day simulators try to make the real, all the real, coincide with their simulation models. But it is no longer a question of either maps or territory. Something has disappeared: the sovereign difference between them that was the abstraction's charm. For it is the difference which forms the poetry of the map and the charm of the territory, the magic of the concept and the charm of the real. This representational imaginary, which both culminates in and is engulfed by the cartographer's mad project of an ideal coextensivity between the map and the territory, disappears with simulation, whose operation is nuclear and genetic, and no longer specular and discursive. With it goes all of metaphysics. No more mirror of being and appearances, of the real and its concept; no more imaginary coextensivity: rather, genetic miniaturization is the dimension of simulation. The real is produced from miniaturized units, from matrices, memory banks and command models - and with these it can be reproduced an indefinite number of times. It no longer has to be rational, since it is no longer measured against some ideal or negative instance. It is nothing more than operational. In fact, since it is no longer enveloped by an imaginary, it is no longer real at all. It is a hyperreal: the product of an irradiating synthesis of combinatory models in a hyperspace without atmosphere.

In this passage to a space whose curvature is no longer that of the real, nor of truth, the age of simulation thus begins with a liquidation of all referentials - worse: by their artificial resurrection in systems of signs, which are a more ductile material than meaning, in that they lend themselves to all systems of equivalence, all binary oppositions and all combinatory algebra. It is no longer a question of imitation, nor of reduplication, nor even of parody. It is rather a question of substituting signs of the real for the real itself; that is, an operation to deter every real process by its operational double, a metastable, programmatic, perfect descriptive machine which provides all the signs of the real and short-circuits all its vicissitudes. Never again will the real have to be produced: this is the vital function of the model in a system of death, or rather of anticipated resurrection which no longer leaves any chance even in the event of death. A hyperreal henceforth sheltered from the imaginary, and from any distinction between the real and the imaginary, leaving room only for the orbital recurrence of models and the simulated generation of difference.

The Divine Irreference of Images

To dissimulate is to feign not to have what one has. To simulate is to feign to have what one hasn't. One implies a presence, the other an absence. But the matter is more complicated, since to simulate is not simply to feign: "Someone who feigns an illness can simply go to bed and pretend he is ill. Someone who simulates an illness produces in himself some of the symptoms" (Littre). Thus, feigning or dissimulating leaves the reality principle intact: the difference is always clear, it is only masked; whereas simulation threatens the difference between "true" and "false", between

"real" and "imaginary". Since the simulator produces "true" symptoms, is he or she ill or not? The simulator cannot be treated objectively either as ill, or as not ill. Psychology and medicine stop at this point, before a thereafter undiscoverable truth of the illness. For if any symptom can be "produced," and can no longer be accepted as a fact of nature, then every illness may be considered as simulatable and simulated, and medicine loses its meaning since it only knows how to treat "true" illnesses by their objective causes. Psychosomatics evolves in a dubious way on the edge of the illness principle. As for psychoanalysis, it transfers the symptom from the organic to the unconscious order: once again, the latter is held to be real, more real than the former; but why should simulation stop at the portals of the unconscious? Why couldn't the "work" of the unconscious be "produced" in the same way as any other symptom in classical medicine? Dreams already are.

The alienist, of course, claims that "for each form of the mental alienation there is a particular order in the succession of symptoms, of which the simulator is unaware and in the absence of which the alienist is unlikely to be deceived." This (which dates from 1865) in order to save at all cost the truth principle, and to escape the specter raised by simulation: namely that truth, reference and objective causes have ceased to exist. What can medicine do with something which floats on either side of illness, on either side of health, or with the reduplication of illness in a discourse that is no longer true or false? What can psychoanalysis do with the reduplication of the discourse of the unconscious in a discourse of simulation that can never be unmasked, since it isn't false either?

What can the army do with simulators? Traditionally, following a direct principle of identification, it unmasks and punishes them. Today, it can reform an excellent simulator as though he were equivalent to a "real" homosexual, heart-case or lunatic. Even military psychology retreats from the Cartesian clarities and hesitates to draw the distinction between true and false, between the "produced" symptom and the authentic symptom. "If he acts crazy so well, then he must be mad." Nor is it mistaken: in the sense that all lunatics are simulators, and this lack of distinction is the worst form of subversion. Against it, classical reason armed itself with all its categories. But it is this today which again outflanks them, submerging the truth principle.

Outside of medicine and the army, favored terrains of simulation, the affair goes back to religion and the simulacrum of divinity: "I forbade any simulacrum in the temples because the divinity that breathes life into nature cannot be represented." Indeed it can. But what becomes of the divinity when it reveals itself in icons, when it is multiplied in simulacra? Does it remain the supreme authority, simply incarnated in images as a visible theology? Or is it volatilized into simulacra which alone deploy their pomp and power of fascination - the visible machinery of icons being substituted for the pure and intelligible Idea of God? This is precisely what was feared by the Iconoclasts, whose millennial quarrel is still with us today. Their rage to destroy images rose precisely because they sensed this omnipotence of simulacra, this facility they have of erasing God from the consciousnesses of people, and the overwhelming, destructive truth which they suggest: that ultimately there has never been any God; that only simulacra exist; indeed that God himself has only ever been his own simulacrum. Had they been able to believe that images only occulted or masked the Platonic idea of God, there would have been no reason to destroy them. One can live with the idea of a distorted truth. But their metaphysical despair came from the idea that the images concealed nothing at all, and that in fact they were not

images, such as the original model would have made them, but actually perfect simulacra forever radiant with their own fascination. But this death of the divine referential has to be exorcised at all cost.

It can be seen that the iconoclasts, who are often accused of despising and denying images, were in fact the ones who accorded them their actual worth, unlike the iconolaters, who saw in them only reflections and were content to venerate God at one remove. But the converse can also be said, namely that the iconolaters possessed the most modern and adventurous minds, since, underneath the idea of the apparition of God in the mirror of images, they already enacted his death and his disappearance in the epiphany of his representations (which they perhaps knew no longer represented anything, and that they were purely a game, but that this was precisely the greatest game - knowing also that it is dangerous to unmask images, since they dissimulate the fact that there is nothing behind them).

This was the approach of the Jesuits, who based their politics on the virtual disappearance of God and on the worldly and spectacular manipulation of consciences - the evanescence of God in the epiphany of power — the end of transcendence, which no longer serves as alibi for a strategy completely free of influences and signs. Behind the baroque of images hides the grey eminence of politics.

Thus perhaps at stake has always been the murderous capacity of images: murderers of the real; murderers of their own model as the Byzantine icons could murder the divine identity. To this murderous capacity is opposed the dialectical capacity of representations as a visible and intelligible mediation of the real. All of Western faith and good faith was engaged in this wager on representation: that a sign could refer to the depth of meaning, that a sign could *exchange* for meaning and that something could guarantee this exchange - God, of course. But what if God himself can be simulated, that is to say, reduced to the signs which attest his existence? Then the whole system becomes weightless; it is no longer anything but a gigantic simulacrum: not unreal, but a simulacrum, never again exchanging for what is real, but exchanging in itself, in an uninterrupted circuit without reference or circumference.

So it is with simulation, insofar as it is opposed to representation. Representation starts from the principle that the sign and the real are equivalent (even if this equivalence is Utopian, it is a fundamental axiom). Conversely, simulation starts from the Utopia of this principle of equivalence, *from the radical negation of the sign as value*, from the sign as reversion and death sentence of every reference. Whereas representation tries to absorb simulation by interpreting it as false representation, simulation envelops the whole edifice of representation as itself a simulacrum.

These would be the successive phases of the image:

- 1 It is the reflection of a basic reality.
- 2 It masks and perverts a basic reality.
- 3 It masks the *absence* of a basic reality.
- 4 It bears no relation to any reality whatever: it is its own pure simulacrum.

In the first case, the image is a *good* appearance: the representation is of the order of sacrament. In the second, it is an *evil* appearance: of the order of malefice. In the third, it *plays at being* an appearance: it is of the order of sorcery. In the fourth, it is no longer in the order of appearance at all, but of simulation.

The transition from signs which dissimulate something to signs which dissimulate that there is nothing, marks the decisive turning point. The first implies a theology of truth and secrecy (to which the notion of ideology still belongs). The second inaugurates an age of simulacra and simulation, in which there is no longer any God to recognize his own, nor any last judgement to separate truth from false, the real from its artificial resurrection, since everything is already dead and risen in advance.

When the real is no longer what it used to be, nostalgia assumes its full meaning. There is a proliferation of myths of origin and signs of reality; of second-hand truth, objectivity and authenticity. There is an escalation of the true, of the lived experience; a resurrection of the figurative where the object and substance have disappeared. And there is a panic-stricken production of the real and the referential, above and parallel to the panic of material production. This is how simulation appears in the phase that concerns us: a strategy of the real, neo-real and hyperreal, whose universal double is a strategy of deterrence.

Hyperreal and Imaginary

Disneyland is a perfect model of all the entangled orders of simulation. To begin with it is a play of illusions and phantasms: pirates, the frontier, future world, etc. This imaginary world is supposed to be what makes the operation successful. But, what draws the crowds is undoubtedly much more the social microcosm, the miniaturized and *religious* revelling in real America, in its delights and drawbacks. You park outside, queue up inside, and are totally abandoned at the exit. In this imaginary world the only phantasmagoria is in the inherent warmth and affection of the crowd, and in that sufficiently excessive number of gadgets used there to specifically maintain the multitudinous affect. The contrast with the absolute solitude of the parking lot - a veritable concentration camp - is total. Or rather: inside, a whole range of gadgets magnetize the crowd into direct flows; outside, solitude is directed onto a single gadget: the automobile. By an extraordinary coincidence (one that undoubtedly belongs to the peculiar enchantment of this universe), this deep-frozen infantile world happens to have been conceived and realized by a man who is himself now cryogenized; Walt Disney, who awaits his resurrection at minus 180 degrees Centigrade.

The objective profile of the United States, then, may be traced throughout Disneyland, even down to the morphology of individuals and the crowd. All its values are exalted here, in miniature and comic-strip form. Embalmed and pacified. Whence the possibility of an ideological analysis of Disneyland (L. Marin does it well in *Utopies, jeux d'espaces*): digest of the American way of life, panegyric to American values, idealized transposition of a contradictory reality. To be sure. But this conceals something else, and that "ideological" blanket exactly serves to cover over a *third-order simulation*: Disneyland is there to conceal the fact that it is the "real" country, all of "real" America, which *is* Disneyland (just as prisons are there to conceal the fact that it is the social in its entirety, in its banal omnipresence, which is carceral). Disneyland is presented as imaginary in order to make us believe that the rest is real, when in fact all of Los Angeles and the America surrounding it are no longer real, but of the order of the hyperreal and of simulation. It is no longer a question of

a false representation of reality (ideology), but of concealing the fact that the real is no longer real, and thus of saving the reality principle.

The Disneyland imaginary is neither true nor false: it is a deterrence machine set up in order to rejuvenate in reverse the fiction of the real. Whence the debility, the infantile degeneration of this imaginary. It is meant to be an infantile world, in order to make us believe that the adults are elsewhere, in the "real" world, and to conceal the fact that real childishness is everywhere, particularly among those adults who go there to act the child in order to foster illusions of their real childishness.

Moreover, Disneyland is not the only one. Enchanted Village, Magic Mountain, Marine World: Los Angeles is encircled by these "imaginary stations" which feed reality, reality-energy, to a town whose mystery is precisely that it is nothing more than a network of endless, unreal circulation: a town of fabulous proportions, but without space or dimensions. As much as electrical and nuclear power stations, as much as film studios, this town, which is nothing more than an immense script and a perpetual motion picture, needs this old imaginary made up of childhood signals and faked phantasms for its sympathetic nervous system.

Political Incantation

Watergate. Same scenario as Disneyland (an imaginary effect concealing that reality no more exists outside than inside the bounds of the artificial perimeter): though here it is a scandal-effect concealing that there is no difference between the facts and their denunciation (identical methods are employed by the CIA and the *Washington Post* journalists). Same operation, though this time tending towards scandal as a means to regenerate a moral and political principle, towards the imaginary as a means to regenerate a reality principle in distress.

The denunciation of scandal always pays homage to the law. And Watergate above all succeeded in imposing the idea that Watergate *was* a scandal - in this sense it was an extraordinary operation of intoxication: the reinjection of a large dose of political morality on a global scale. It could be said along with Bourdieu that: "The specific character of every relation of force is to dissimulate itself as such, and to acquire all its force only because it is so dissimulated"; understood as follows: capital, which is immoral and unscrupulous, can only function behind a moral superstructure, and whoever regenerates this public morality (by indignation, denunciation, etc.) spontaneously furthers the order of capital, as did the *Washington Post* journalists.

But this is still only the formula of ideology, and when Bourdieu enunciates it, he takes "relation of force" to mean the *truth* of capitalist domination, and he *denounces* this relation of force as itself a *scandal*: he therefore occupies the same deterministic and moralistic position as the *Washington Post* journalists. He does the same job of purging and reviving moral order, an order of truth wherein the genuine symbolic violence of the social order is engendered, well beyond all relations of force, which are only elements of its indifferent and shifting configuration in the moral and political consciousnesses of people.

All that capital asks of us is to receive it as rational or to combat it in the name of rationality, to receive it as moral or to combat it in the name of morality. For they are *identical*, meaning *they can be read another way*: before, the task was to dissimulate scandal; today, the task is to conceal the fact that there is none.

Watergate is not a scandal: this is what must be said at all cost, for this is what everyone is concerned to conceal, this dissimulation masking a strengthening of morality, a moral panic as we approach the primal (mise-en-)scene of capital: its instantaneous cruelty; its incomprehensible ferocity; its fundamental immorality -these are what are scandalous, unaccountable for in that system of moral and economic equivalence which remains the axiom of leftist thought, from Enlightenment theory to communism. Capital doesn't give a damn about the idea of the contract which is imputed to it: it is a monstrous unprincipled undertaking, nothing more. Rather, it is "enlightened" thought which seeks to control capital by imposing rules on it. And all that recrimination which replaced revolutionary thought today comes down to reproaching capital for not following the rules of the game. "Power is unjust; its justice is a class justice; capital exploits us; etc." - as if capital were linked by a contract to the society it rules. It is the left which holds out the mirror of equivalence, hoping that capital will fall for this phantasmagoria of the social contract and fulfill its obligation towards the whole of society (at the same time, no need for revolution: it is enough that capital accept the rational formula of exchange).

Capital in fact has never been linked by a contract to the society it dominates. It is a sorcery of the social relation, it is *a challenge to society* and should be responded to as such. It is not a scandal to be denounced according to moral and economic rationality, but a challenge to take up according to symbolic law.

Moebius: Spiralling Negativity

Hence Watergate was only a trap set by the system to catch its adversaries - a simulation of scandal to regenerative ends. This is embodied by the character called "Deep Throat," who was said to be a Republican grey eminence manipulating the leftist journalists in order to get rid of Nixon - and why not? All hypotheses are possible, although this one is superfluous: the work of the Right is done very well, and spontaneously, by the Left on its own. Besides, it would be naive to see an embittered good conscience at work here. For the Right itself also spontaneously does the work of the Left. All the hypotheses of manipulation are reversible in an endless whirligig. For manipulation is a floating causality where positivity and negativity engender and overlap with one another; where there is no longer any active or passive. It is by putting an *arbitrary* stop to this revolving causality that a principle of political reality can be saved. It is by the *simulation* of a conventional, restricted perspective field, where the premises and consequences of any act or event are calculable, that a political credibility can be maintained (including, of course, "objective" analysis, struggle, etc.). But if the entire cycle of any act or event is envisaged in a system where linear continuity and dialectical polarity no longer exist, in a field *unhinged by simulation*, then all determination evaporates, every act terminates at the end of the cycle having benefited everyone and been scattered in all directions.

Is any given bombing in Italy the work of leftist extremists; or of extreme right-wing provocation; or staged by centrists to bring every terrorist extreme into disrepute and to shore up its own failing power; or again, is it a police-inspired scenario in order to appeal to calls for public security? All this is equally true, and the search for proof - indeed the objectivity of the fact - does not check this vertigo of interpretation. We are in a logic of simulation which has nothing to do with a logic of facts and

an order of reasons. Simulation is characterized by a *precession of the model*, of all models around the merest fact - the models come first, and their orbital (like the bomb) circulation constitutes the genuine magnetic field of events. Facts no longer have any trajectory of their own, they arise at the intersection of the models; a single fact may even be engendered by all the models at once. This anticipation, this precession, this short-circuit, this confusion of the fact with its model (no more divergence of meaning, no more dialectical polarity, no more negative electricity or implosion of poles) is what each time allows for all the possible interpretations, even the most contradictory - all are true, in the sense that their truth is exchangeable, in the image of the models from which they proceed, in a generalized cycle ____

It would take too long to run through the whole range of operational negativity, of all those scenarios of deterrence which, like Watergate, try to revive a moribund principle by simulated scandal, phantasm, murder - a sort of hormonal treatment by negativity and crisis. It is always a question of proving the real by the imaginary; proving truth by scandal; proving the law by transgression; proving work by the strike; proving the system by crisis and capital by revolution; and for that matter proving ethnology by the dispossession of its object (the Tasaday). Without counting: proving theater by anti-theater; proving art by anti-art; proving pedagogy by anti-pedagogy; proving psychiatry by anti-psychiatry, etc., etc.

Everything is metamorphosed into its inverse in order to be perpetuated in its purged form. Every form of power, every situation speaks of itself by denial, in order to attempt to escape, by simulation of death, its real agony. Power can stage its own murder to rediscover a glimmer of existence and legitimacy. Thus with the American presidents: the Kennedys are murdered because they still have a political dimension. Others - Johnson, Nixon, Ford - only had a right to puppet attempts, to simulated murders. But they nevertheless needed that aura of an artificial menace to conceal that they were nothing other than mannequins of power. In olden days the king (also the god) had to die - that was his strength. Today he does his miserable utmost to pretend to die, so as to preserve the *blessing* of power. But even this is gone.

To seek new blood in its own death, to renew the cycle by the mirror of crisis, negativity and anti-power: this is the only alibi of every power, of every institution attempting to break the vicious circle of its irresponsibility and its fundamental nonexistence, of its *deja-vu* and its *deja-mort*.

Strategy of the Real

Of the same order as the impossibility of rediscovering an absolute level of the real, is the impossibility of staging an illusion. Illusion is no longer possible, because the real is no longer possible. It is the whole *political* problem of the parody, of hypersimulation or offensive simulation, which is posed here.

For example: it would be interesting to see whether the repressive apparatus would not react more violently to a simulated hold-up than to a real one? For a real hold-up only upsets the order of things, the right of property, whereas a simulated hold-up interferes with the very principle of reality. Transgression and violence are less serious, for they only contest the *distribution* of the real. Simulation is infinitely more dangerous since it always suggests, over and above its object, that *law and order themselves might really be nothing more than a simulation*.

But the difficulty is in proportion to the peril. How to feign a violation and put it to the test? Go and simulate a theft in a large department store: how do you convince the security guards that it is a simulated theft? There is no "objective" difference: the same gestures and the same signs exist as for a real theft; in fact the signs incline neither to one side nor the other. As far as the established order is concerned, they are always of the order of the real.

Go and organize a fake hold-up. Be sure to check that your weapons are harmless, and take the most trustworthy hostage, so that no life is in danger (otherwise you risk committing an offence). Demand ransom, and arrange it so that the operation creates the greatest commotion possible. In brief, stay close to the "truth", so as to test the reaction of the apparatus to a perfect simulation. But you won't succeed: the web of artificial signs will be inextricably mixed up with real elements (a police officer will really shoot on sight; a bank customer will faint and die of a heart attack; they will really turn the phoney ransom over to you). In brief, you will unwittingly find yourself immediately in the real, one of whose functions is precisely to devour every attempt at simulation, to reduce everything to some reality: that's exactly how the established order is, well before institutions and justice come into play.

In this impossibility of isolating the process of simulation must be seen the whole thrust of an order that can only see and understand in terms of some reality, because it can function nowhere else. The simulation of an offence, if it is patent, will either be punished more lightly (because it has no "consequences") or be punished as an offence to public office (for example, if one triggered off a police operation "for nothing") -but *never as simulation*, since it is precisely as such that no equivalence with the real is possible, and hence no repression either. The challenge of simulation is irreceivable by power. How can you punish the simulation of virtue? Yet as such it is as serious as the simulation of crime. Parody makes obedience and transgression equivalent, and that is the most serious crime, since it *cancels out the difference upon which the law is based*. The established order can do nothing against it, for the law is a second-order simulacrum whereas simulation is a third-order simulacrum, beyond true and false, beyond equivalences, beyond the rational distinctions upon which function all power and the entire social stratum. Hence, *failing the real*, it is here that we must aim at order.

This is why order always opts for the real. In a state of uncertainty, it always prefers this assumption (thus in the army they would rather take the simulator as a true madman). But this becomes more and more difficult, for it is practically impossible to isolate the process of simulation; through the force of inertia of the real which surrounds us, the inverse is also true (and this very reversibility forms part of the apparatus of simulation and of power's impotency): namely, *it is now impossible to isolate the process of the real*, or to prove the real.

Thus all hold-ups, hijacks and the like are now as it were simulation hold-ups, in the sense that they are inscribed in advance in the decoding and orchestration rituals of the media, anticipated in their mode of presentation and possible consequences. In brief, where they function as a set of signs dedicated exclusively to their recurrence as signs, and no longer to their "real" goal at all. But this does not make them inoffensive. On the contrary, it is as hyperreal events, no longer having any particular contents or aims, but indefinitely refracted by each other (for that matter like so-called historical events: strikes, demonstrations, crises, etc.), that they are precisely unverifiable by an order which can only exert itself on the real and the rational, on ends and means: a referential order which can only dominate referentials, a determin-

ate power which can only dominate a determined world, but which can do nothing about that indefinite recurrence of simulation, about that weightless nebula no longer obeying the law of gravitation of the real - power itself eventually breaking apart in this space and becoming a simulation of power (disconnected from its aims and objectives, and dedicated to *power effects* and mass simulation).

The only weapon of power, its only strategy against this defection, is to reinject realness and referentiality everywhere, in order to convince us of the reality of the social, of the gravity of the economy and the finalities of production. For that purpose it prefers the discourse of crisis, but also - why not? - the discourse of desire. "Take your desires for reality!" can be understood as the ultimate slogan of power, for in a nonreferential world even the confusion of the reality principle with the desire principle is less dangerous than contagious hyperreality. One remains among principles, and there power is always right.

Hyperreality and simulation are deterrents of every principle and of every objective; they turn against power this deterrence which is so well utilized for a long time itself. For, finally, it was capital which was the first to feed throughout its history on the destruction of every referential, of every human goal, which shattered every ideal distinction between true and false, good and evil, in order to establish a radical law of equivalence and exchange, the iron law of its power. It was the first to practice deterrence, abstraction, disconnection, deterritorialization, etc.; and if it was capital which fostered reality, the reality principle, it was also the first to liquidate it in the extermination of every use value, of every real equivalence, of production and wealth, in the very sensation we have of the unreality of the stakes and the omnipotence of manipulation. Now, it is this very logic which is today hardened even more *against* it. And when it wants to fight this catastrophic spiral by secreting one last glimmer of reality, on which to found one last glimmer of power, it only multiplies the *signs* and accelerates the play of simulation.

As long as it was historically threatened by the real, power risked deterrence and simulation, disintegrating every contradiction by means of the production of equivalent signs. When it is threatened today by simulation (the threat of vanishing in the play of signs), power risks the real, risks crisis, it gambles on remanufacturing artificial, social, economic, political stakes. This is a question of life or death for it. But it is too late.

Whence the characteristic hysteria of our time: the hysteria of production and reproduction of the real. The other production, that of goods and commodities, that of *la belle époque* of political economy, no longer makes any sense of its own, and has not for some time. What society seeks through production, and overproduction, is the restoration of the real which escapes it. That is why *contemporary "material" production is itself hyperreal*. It retains all the features, the whole discourse of traditional production, but it is nothing more than its scaled-down refraction (thus the hyperrealists fasten in a striking resemblance a real from which has fled all meaning and charm, all the profundity and energy of representation). Thus the hyperrealism of simulation is expressed everywhere by the real's striking resemblance to itself.

Power, too, for some time now produces nothing but signs of its resemblance. And at the same time, another figure of power comes into play: that of a collective demand for *signs* of power - a holy union which forms around the disappearance of power. Everybody belongs to it more or less in fear of the collapse of the political. And in the end the game of power comes down to nothing more than the *critical*

obsession with power: an obsession with its death; an obsession with its survival which becomes greater the more it disappears. When it has totally disappeared, logically we will be under the total spell of power - a haunting memory already foreshadowed everywhere, manifesting at one and the same time the satisfaction of having got rid of it (nobody wants it any more, everybody unloads it on others) and grieving its loss. Melancholy for societies without power: this has already given rise to fascism, that overdose of a powerful referential in a society which cannot terminate its mourning.

But we are still in the same boat: none of our societies know how to manage their mourning for the real, for power, for the *social itself*, which is implicated in this same breakdown. And it is by an artificial revitalization of all this that we try to escape it. *Undoubtedly this will even end up in socialism*. By an unforeseen twist of events and an irony which no longer belongs to history, it is through the death of the social that socialism will emerge — as it is through the death of God that religions emerge. A twisted coming, a perverse event, an unintelligible reversion to the logic of reason. As is the fact that power is no longer present except to conceal that there is none. A simulation which can go on indefinitely, since - unlike "true" power which is, or was, a structure, a strategy, a relation of force, a stake - this is nothing but the object of a social *demand*, and hence subject to the law of supply and demand, rather than to violence and death. Completely expunged from the *political* dimension, it is dependent, like any other commodity, on production and mass consumption. Its spark has disappeared; only the fiction of a political universe is saved.

Likewise with work. The spark of production, the violence of its stake no longer exists. Everybody still produces, and more and more, but work has subtly become something else: a need (as Marx ideally envisaged it, but not at all in the same sense), the object of a social "demand," like leisure, to which it is equivalent in the general run of life's options. A demand exactly proportional to the loss of stake in the work process. The same change in fortune as for power: the *scenario* of work is there to conceal the fact that the work-real, the production-real, has disappeared. And for that matter so has the strike-real too, which is no longer a stoppage of work, but its alternative pole in the ritual scansion of the social calendar. It is as if everyone has "occupied" their work place or work post, after declaring the strike, and resumed production, as is the custom in a "self-managed" job, in exactly the same terms as before, by declaring themselves (and virtually being) in a state of permanent strike.

This isn't a science-fiction dream: everywhere it is a question of a doubling of the work process. And of a double or locum for the strike process - strikes which are incorporated like obsolescence in objects, like crises in production. Then there are no longer any strikes or work, but both simultaneously, that is to say something else entirely: a wizardry of work, a *trompe l'oeil*, a scenodrama (not to say melodrama) of production, collective dramaturgy upon the empty stage of the social.

It is no longer a question of the *ideology* of work - of the traditional ethic that obscures the "real" labour process and the "objective" process of exploitation -but of the scenario of work. Likewise, it is no longer a question of the ideology of power, but of the *scenario* of power. Ideology only corresponds to a betrayal of reality by signs; simulation corresponds to a short-circuit of reality and to its reduplication by signs. It is always the aim of ideological analysis to restore the objective process; it is always a false problem to want to restore the truth beneath the simulacrum.

This is ultimately why power is so in accord with ideological discourses and discourses on ideology, for these are all discourses of *truth* - always good, even and especially if they are revolutionary, to counter the mortal blows of simulation.

Notes

- 1 Counterfeit and reproduction imply always an anguish, a disquieting foreignness: the uneasiness before the photograph, considered like a witch's trick - and more generally before any technical apparatus, which is always an apparatus of reproduction, is related by Benjamin to the uneasiness before the mirror-image. There is already sorcery at work in the mirror. But how much more so when this image can be detached from the mirror and be transported, stocked, reproduced at will (cf. *The Student of Prague*, where the devil detaches the image of the student from the mirror and harasses him to death by the intermediary of this image). All reproduction implies therefore a kind of black magic, from the fact of being seduced by one's own image in the water, like Narcissus, to being haunted by the double and, who knows, to the mortal turning back of this vast technical apparatus secreted today by man as his own image (the narcissistic mirage of technique, McLuhan) and that returns to him, cancelled and distorted -endless reproduction of himself and his power to the limits of the world. Reproduction is diabolical in its very essence; it makes something fundamental vacillate. This has hardly changed for us: simulation (that we describe here as the operation of the code) is still and always the place of a gigantic enterprise of manipulation, of control and of death, just like the imitative object (primitive statuette, image of photo) always had as objective an operation of black image.
- 2 There is furthermore in Monod's book a flagrant contradiction, which reflects the ambiguity of all current science. His discourse concerns the code, that is the third-order simulacra, but it does so still according to "scientific" schemes of the second-order - objectiveness, "scientific" ethic of knowledge, science's principle of truth and transcendence. All things incompatible with the indeterminable models of the third-order.
- 3 "It's the feeble 'definition' of TV which condemns its spectator to rearranging the few points retained into a kind of *abstract work*. He participates suddenly in the creation of a reality that was only just presented to him in dots: the television watcher is in the position of an individual who is asked to project his own fantasies on inkblots that are not supposed to represent anything." TV as perpetual Rorschach test. And furthermore: "The TV image requires each instant that we 'close' the spaces in the mesh by a convulsive sensuous participation that is profoundly kinetic and tactile."
- 4 The entire current "psychological" situation is characterized by this short circuit.
Doesn't emancipation of children and teenagers, once the initial phase of revolt is passed and once there has been established the *principle* of the *right* to emancipation, seem like the *real* emancipation of parents. And the young (students, high-schoolers, adolescents) seem to sense it in their always more insistent demand (though still as paradoxical) for the presence and advice of parents or of teachers. Alone at last, free and responsible, it seemed to them suddenly that other people possibly have absconded with their true liberty. Therefore, there is no question of "leaving them be." They're going to hassle them, not with any emotional or material spontaneous demand, but with an exigency that has been premeditated and corrected by an implicit oedipal knowledge. Hyperdependence (much greater than before) distorted by irony and refusal, *parody of libidinous original mechanisms*. Demand without content, without referent, unjustified, but for all that all the more severe - naked demand with no possible answer. The contents of knowledge (teaching) or of affective relations, the pedagogical or familial referent having been eliminated in the act of emancipation, there remains only a demand linked to the empty form of the institution - perverse demand, and for that reason all the more obstinate. "Transferable" desire (that is to say non-referential, un-referential), desire that has been fed by lack, by the place left vacant, "liberated," desire captured in its own vertiginous image, desire

of desire, as pure form, hyperreal. Deprived of symbolic substance, it doubles back upon itself, draws its energy from its own reflection and its disappointment with itself. This is literally today the "demand," and it is obvious that unlike the "classical" objective or transferable relations this one here is insoluble and interminable.

Simulated Oedipus.

Francois Richard: "Students asked to be seduced either bodily or verbally. But also they are aware of this and they play the game, ironically. 'Give us your knowledge, your presence, you have the word, speak, you are there for that.' Contestation certainly, but not only: the more authority is contested, vilified, the greater the need for authority as such. They play at Oedipus also, to deny it all the more vehemently. The 'teach', he's Daddy, they say; it's fun, you play at incest, malaise, the untouchable, at being a tease - in order to de-sexualize finally." Like one under analysis who asks for Oedipus back again, who tells the "oedipal" stories, who has the "analytical" dreams to satisfy the supposed request of the analyst, or to resist him? In the same way the student goes through his oedipal number, his seduction number, gets chummy, close, approaches, dominates - but this isn't desire, it's simulation. Oedipal psychodrama of simulation (neither less real nor less dramatic for all that). Very different from the real libidinal stakes of knowledge and power or even of a real mourning for the absence of same (as could have happened after 1968 in the universities). Now we've reached the phase of desperate reproduction, and where the stakes are nil, the simulacrum is maximal - exacerbated and parodied simulation at one and the same time - as interminable as psychoanalysis and for the same reasons.

The interminable psychoanalysis.

There is a whole chapter to add to the history of transference and countertransference: that of their liquidation by simulation, of the impossible psychoanalysis because it is itself, from now on, that produces and reproduces the unconscious as its institutional substance. Psychoanalysis dies also of the exchange of the *signs* of the unconscious. Just as revolution dies of the exchange of the critical signs of political economy. This short circuit was well known to Freud in the form of the gift of the analytic dream, or with the "uninformed" patients, in the form of the gift of their analytic knowledge. But this was still interpreted as resistance, as detour, and did not put fundamentally into question either the process of analysis or the principle of transference. It is another thing entirely when the unconscious itself, the discourse of the unconscious becomes unfindable - according to the same scenario of simulative anticipation that we have seen at work on all levels with the machines of the third order. The analysis then can no longer end, it becomes logically and historically interminable, since it stabilizes on a puppet-substance of reproduction, an unconscious programmed on demand - an impossible-to-break-through point around which the whole analysis is rearranged. The messages of the unconscious have been short-circuited by the psychoanalysis "medium." This is libidinal hyperrealism. To the famous categories of the real, the symbolic and the imaginary, it is going to be necessary to add the hyperreal, which captures and obstructs the functioning of the three orders. 5 Athenian democracy, much more advanced than our own, had reached the point where the vote was considered as payment for a service, after all other repressive solutions had been tried and found wanting in order to insure a quorum.

A Thousand Plateaus

Gilles Deleuze and Felix Guattari

Philosopher Gilles Deleuze's book on Nietzsche, *Nietzsche and Philosophy* (1961), helped inaugurate the interest in Nietzsche's work that would culminate later in the decade in the emergence of Post-Structuralism. Other books by Deleuze, such as *The Logic of Meaning* (1969), explored the underside of Structuralism, the realm of nonsense that sustained the order-making rules of language. His collaboration with Felix Guattari resulted in two important Post-Structuralist books - *The Anti-Oedipus* (1972), a critique of Freudian psychoanalysis, and *A Thousand Plateaus: Capitalism and Schizophrenia* (1980) - an ambitious model of history and of the world. Deleuze and Guattari in that latter work describe a conflict between two modes of social organization that coincide with two models of reality. One is arboresque and favors order and hierarchy. The other is rhizomatic and favors an undoing of all such orders and hierarchies. A rhizome is the root of a plant that travels laterally underground and proliferates unpredictably. History, the writers argue, alternates between moments of fixity and power that they called "territorialization" and moments of "deterritorialization" or undoing, when fixed orders fall apart and are transformed.

The two of us wrote *Anti-Oedipus* together. Since each of us was several, there was already quite a crowd. Here we have made use of everything that came within range, what was closest as well as farthest away. We have assigned clever pseudonyms to prevent recognition. Why have we kept our own names? Out of habit, purely out of habit. To make ourselves unrecognizable in turn. To render imperceptible, not ourselves, but what makes us act, feel, and think. Also because it's nice to talk like everybody else, to say the sun rises, when everybody knows it's only a manner of speaking. To reach, not the point where one no longer says I, but the point where it is no longer of any importance whether one says I. We are no longer ourselves. Each will know his own. We have been aided, inspired, multiplied.

A book has neither object nor subject; it is made of variously formed matters, and very different dates and speeds. To attribute the book to a subject is to overlook this working of matters, and the exteriority of their relations. It is to fabricate a beneficent God to explain geological movements. In a book, as in all things, there are lines of articulation or segmentarity, strata and territories; but also lines of flight, movements of deterritorialization and destratification. Comparative rates of flow on these lines produce phenomena of relative slowness and viscosity, or, on the contrary, of acceleration and rupture. All this, lines and measurable speeds, constitutes an *assemblage*. A book is an assemblage of this kind, and as such is unattributable. It is a multiplicity - but we don't know yet what the multiple entails when it is no longer attributed, that is, after it has been elevated to the status of a substantive. One side of

a machinic assemblage faces the strata, which doubtless make it a kind of organism, or signifying totality, or determination attributable to a subject; it also has a side facing a *body without organs* [BwO], which is continually dismantling the organism, causing asignifying particles or pure intensities to pass or circulate and attributing to itself subjects that it leaves with nothing more than a name as the trace of an intensity. What is the body without organs of a book? There are several, depending on the nature of the lines considered, their particular grade or density, and the possibility of their converging on a "plane of consistency" assuring their selection. Here, as elsewhere, the units of measure are what is essential: *quantify writing*. There is no difference between what a book talks about and how it is made. Therefore a book also has no object. As an assemblage, a book has only itself, in connection with other assemblages and in relation to other bodies without organs. We will never ask what a book means, as signified or signifier, we will not look for anything to understand in it. We will ask what it functions with, in connection with what other things it does or does not transmit intensities, in which other multiplicities its own are inserted and metamorphosed, and with what bodies without organs it makes its own converge. A book exists only through the outside and on the outside. A book itself is a little machine; what is the relation (also measurable) of this literary machine to a war machine, love machine, revolutionary machine, etc. - and an *abstract machine* that sweeps them along? We have been criticized for overquoting literary authors. But when one writes, the only question is which other machine the literary machine can be plugged into, must be plugged into in order to work. Kleist and a mad war machine, Kafka and a most extraordinary bureaucratic machine ... (What if one became animal or plant *through* literature, which certainly does not mean literarily? Is it not first through the voice that one becomes animal?) Literature is an assemblage. It has nothing to do with ideology. There is no ideology and never has been.

All we talk about are multiplicities, lines, strata and segmentarities, lines of flight and intensities, machinic assemblages and their various types, bodies without organs and their construction and selection, the plane of consistency, and in each case the units of measure. *Stratometers, deleometers, BwO units of density BwO units of convergence*: Not only do these constitute a quantification of writing, but they define writing as always the measure of something else. Writing has nothing to do with signifying. It has to do with surveying, mapping, even realms that are yet to come.

A first type of book is the root-book. The tree is already the image of the world, or the root the image of the world-tree. This is the classical book, as noble, signifying, and subjective organic interiority (the strata of the book). The book imitates the world, as art imitates nature: by procedures specific to it that accomplish what nature cannot or can no longer do. The law of the book is the law of reflection, the One that becomes two. How could the law of the book reside in nature, when it is what presides over the very division between world and book, nature and art? One that becomes two: whenever we encounter this formula, even stated strategically by Mao or understood in the most "dialectical" way possible, what we have before us is the most classical and well reflected, oldest, and weariest kind of thought. Nature doesn't work that way: in nature, roots are taproots with a more multiple, lateral, and circular system of ramification, rather than a dichotomous one....

The radicle-system, or fascicular root, is the second figure of the book, to which our modernity pays willing allegiance. This time, the principal root has aborted, or

its tip has been destroyed; an immediate, indefinite multiplicity of secondary roots grafts onto it and undergoes a flourishing development. This time, natural reality is what aborts the principal root, but the root's unity subsists, as past or yet to come, as possible. We must ask if reflexive, intellectual reality does not compensate for this state of things by demanding an even more comprehensive secret unity, or a more extensive totality. Take William Burroughs's cut-up method: the folding of one text onto another, which constitutes multiple and even adventitious roots (like a cutting), implies a supplementary dimension to that of the texts under consideration. In this supplementary dimension of folding, unity continues its intellectual labor. That is why the most resolutely fragmented work can also be presented as the Total Work or Magnum Opus. Most modern methods for making series proliferate or a multiplicity grow are perfectly valid in one direction, for example, a linear direction, whereas a unity of totalization asserts itself even more firmly in another, circular or cyclic, dimension. Whenever a multiplicity is taken up in a structure, its growth is offset by a reduction in its laws of combination. The abortionists of unity are indeed angel makers, *doctores angelici*, because they affirm a properly angelic and superior unity. Joyce's words, accurately described as having "multiple roots," shatter the linear unity of the word, even of language, only to posit a cyclic unity of the sentence, text, or knowledge. Nietzsche's aphorisms shatter the linear unity of knowledge, only to invoke the cyclic unity of the eternal return, present as the nonknown in thought. This is as much as to say that the fascicular system does not really break with dualism, with the complementarity between a subject and an object, a natural reality and a mental reality: unity is consistently thwarted and obstructed in the object, while a new type of unity triumphs in the subject. The world has lost its pivot; the subject can no longer even dichotomize, but accedes to a higher unity, of ambivalence or overdetermination, in an always supplementary dimension to that of its object. The world has become chaos, but the book remains the image of the world: radicle-chaosmos rather than root-cosmos. A strange mystification: a book all the more total for being fragmented. At any rate, what a vapid idea, the book as the image of the world. In truth, it is not enough to say, "Long live the multiple," difficult as it is to raise that cry. No typographical, lexical, or even syntactical cleverness is enough to make it heard. The multiple must *be made*,... A system of this kind could be called a rhizome. A rhizome as subterranean stem is absolutely different from roots and radicles. Bulbs and tubers are rhizomes. Plants with roots or radicles may be rhizomorphic in other respects altogether: the question is whether plant life in its specificity is not entirely rhizomatic. Even some animals are, in their pack form. Rats are rhizomes. Burrows are too, in all of their functions of shelter, supply, movement, evasion, and breakout. The rhizome itself assumes very diverse forms, from ramified surface extension in all directions to concretion into bulbs and tubers. When rats swarm over each other. The rhizome includes the best and the worst: potato and couchgrass, or the weed. Animal and plant, couchgrass is crabgrass. We get the distinct feeling that we will convince no one unless we enumerate certain approximate characteristics of the rhizome.

1 and 2 Principles of connection and heterogeneity: any point of a rhizome can be connected to anything other, and must be. This is very different from the tree or root, which plots a point, fixes an order. The linguistic tree on the Chomsky model still begins at a point S and proceeds by dichotomy. On the contrary, not every trait in a rhizome is necessarily linked to a linguistic feature: semiotic chains of every

nature are connected to very diverse modes of coding (biological, political, economic, etc.) that bring into play not only different regimes of signs but also states of things of differing status. *Collective assemblages of enunciation* function directly within *maritime assemblages*; it is not impossible to make a radical break between regimes of signs and their objects. Even when linguistics claims to confine itself to what is explicit and to make no presuppositions about language, it is still in the sphere of a discourse implying particular modes of assemblage and types of social power. Chomsky's grammaticality, the categorical S symbol that dominates every sentence, is more fundamentally a marker of power than a syntactic marker: you will construct grammatically correct sentences, you will divide each statement into a noun phrase and a verb phrase (first dichotomy...). Our criticism of these linguistic models is not that they are too abstract but, on the contrary, that they are not abstract enough, that they do not reach the *abstract machine* that connects a language to the semantic and pragmatic contents of statements, to collective assemblages of enunciation, to a whole micropolitics of the social field. A rhizome ceaselessly establishes connections between semi-otic chains, organizations of power, and circumstances relative to the arts, sciences, and social struggles. A semiotic chain is like a tuber agglomerating very diverse acts, not only linguistic, but also perceptive, mimetic, gestural, and cognitive: there is no language in itself, nor are there any linguistic universals, only a throng of dialects, patois, slangs, and specialized languages. There is no ideal speaker-listener, any more than there is a homogeneous linguistic community. Language is, in Weinreich's words, "an essentially heterogeneous reality." There is no mother tongue, only a power takeover by a dominant language within a political multiplicity. Language stabilizes around a parish, a bishopric, a capital. It forms a bulb. It evolves by subterranean stems and flows, along river valleys or train tracks; it spreads like a patch of oil. It is always possible to break a language down into internal structural elements, an undertaking not fundamentally different from a search for roots. There is always something genealogical about a tree. It is not a method for the people. A method of the rhizome type, on the contrary, can analyze language only by decentring it onto other dimensions and other registers. A language is never closed upon itself, except as a function of impotence.

3 Principle of multiplicity: it is only when the multiple is effectively treated as a substantive, "multiplicity," that it ceases to have any relation to the One as subject or object, natural or spiritual reality, image and world. Multiplicities are rhizomatic, and expose arborescent pseudomultiplicities for what they are. There is no unity to serve as a pivot in the object or to divide in the subject. There is not even the unity to abort in the object or "return" in the subject. A multiplicity has neither subject nor object, only determinations, magnitudes, and dimensions that cannot increase in number without the multiplicity changing in nature (the laws of combination therefore increase in number as the multiplicity grows). Puppet strings, as a rhizome or multiplicity, are tied not to the supposed will of an artist or puppeteer but to a multiplicity of nerve fibers, which form another puppet in other dimensions connected to the first: "Call the strings or rods that move the puppet the weave. It might be objected that its *multiplicity* resides in the person of the actor; who projects it into the text. Granted; but the actor's nerve fibers in turn form a weave. And they fall through the gray matter, the grid, into the undifferentiated... The interlay approximates the pure activity of weavers attributed in myth to the Fates or Norns." An assemblage is precisely this increase in the dimensions of a multiplicity that

necessarily changes in nature as it expands its connections. There are no points or positions in a rhizome, such as those found in a structure, tree, or root. There are only lines. When Glenn Gould leads up the performance of a piece, he is not just displaying virtuosity, he is transforming the musical points into lines, he is making the whole piece proliferate. The number is no longer a universal concept measuring elements according to their emplacement in a given dimension, but has itself become a multiplicity that varies according to the dimensions considered the primacy of the domain over a complex of numbers attached to that domain. We do not have units (*unites*) of measure, only multiplicities or varieties of measurement. The notion of unity (*unite*) appears only when there is a power takeover in the multiplicity by the signifier or a corresponding subjectification proceeding: This is the case for a pivot-unity forming the basis for a set of biunivocal relationships between objective arguments or points, or for the One that divides following the law of a binary of differentiation in the subject. Unity always operates in an empty tension supplementary to that of the system considered (overcoding). The point is that a rhizome or multiplicity never allows itself to be overcoded, never has available a supplementary dimension over and above its number of lines, that is, over and above the multiplicity of numbers attached to those lines. All multiplicities are flat, in the sense that they fill or occupy all of their dimensions: we will therefore speak of a *plane of consistency* of multiplicities, even though the dimensions of this "plane" increase with the number of connections that are made on it. Multiplicities are defined by the outside: by the abstract line, the line of flight or deterritorialization according to which they change in nature and connect with other multiplicities. The plane of consistency (grid) is the outside of all multiplicities. The line of flight marks: the reality of a finite number of dimensions that the multiplicity effectively fills; the impossibility of a supplementary dimension, unless the multiplicity is transformed by the line of flight; the possibility and necessity of flattening all of the multiplicities on a single plane of consistency or exteriority, regardless of their number of dimensions. The ideal for a book would be to lay everything out on a plane of exteriority of this kind, on a single page, the same sheet: lived events, historical determinations, concepts, individuals, groups, social formations. Kleist invented a writing of this type, a broken chain of affects and variable speeds, with accelerations and transformations, always in a relation with the outside. Open rings. His texts, therefore, are opposed in every way to the classical or romantic book constituted by the interiority of a substance or subject. The war machine-book against the State apparatus-book. *Flat multiplicities of n dimensions* are asignifying and asubjective. They are designated by indefinite articles, or rather by partitives (*some* couchgrass, *some* of a rhizome...).

4 Principle of asignifying rupture: against the oversignifying breaks separating structures or cutting across a single structure. A rhizome may be broken, shattered at a given spot, but it will start up again on one of its old lines, or on new lines. You can never get rid of ants because they form an animal rhizome that can rebound time and again after most of it has been destroyed. Every rhizome contains lines of segmentarity according to which it is stratified, territorialized, organized, signified, attributed, etc., as well as lines of deterritorialization down which it constantly flees. There is a rupture in the rhizome whenever segmentary lines explode into a line of flight, but the line of flight is part of the rhizome. These lines always tie back to one another. That is why one can never posit a dualism or a dichotomy, even in the rudimentary form of the good and the bad. You may make a rupture, draw a line of

flight, yet there is still a danger that you will reencounter organizations that re-stratify everything, formations that restore power to a signifier, attributions that reconstitute a subject - anything you like, from Oedipal resurgences to fascist concretions. Groups and individuals contain microfascisms just waiting to crystallize. Yes, couch-grass is also a rhizome. Good and bad are only the products of an active and temporary selection, which must be renewed.

How could movements of deterritorialization and processes of reterritorialization not be relative, always connected, caught up in one another? The orchid deterritorializes by forming an image, a tracing of a wasp; but the wasp reterritorializes on that image. The wasp is nevertheless deterritorialized, becoming a piece in the orchid's reproductive apparatus. But it reterritorializes the orchid by transporting its pollen. Wasp and orchid, as heterogeneous elements, form a rhizome. It could be said that the orchid imitates the wasp, reproducing its image in a signifying fashion (mimesis, mimicry, lure, etc.). But this is true only on the level of the strata - a parallelism between two strata such that a plant organization on one imitates an animal organization on the other. At the same time, something else entirely is going on: not imitation at all but a capture of code, surplus value of code, an increase in valence, a veritable becoming, a becoming-wasp of the orchid and a becoming-orchid of the wasp. Each of these becomings brings about the deterritorialization of one term and the reterritorialization of the other; the two becomings interlink and form relays in a circulation of intensities pushing the deterritorialization ever further. There is neither imitation nor resemblance, only an exploding of two heterogeneous series on the line of flight composed by a common rhizome that can no longer be attributed to or subjugated by anything signifying.... Transversal communications between different lines scramble the genealogical trees. Always look for the molecular, or even submolecular, particle with which we are allied. We evolve and die more from our polymorphous and rhizomatic flux than from hereditary diseases, or diseases that have their own line of descent. The rhizome is an antigenealogy.

The same applies to the book and the world: contrary to a deeply rooted belief, the book is not an image of the world. It forms a rhizome with the world, there is an *aparallel* evolution of the book and the world; the book assures the deterritorialization of the world, but the world effects a reterritorialization of the book, which in turn deterritorializes itself in the world (if it is capable, if it can). Mimesis is a very bad concept, since it relies on binary logic to describe phenomena of an entirely different nature. The crocodile does not reproduce a tree trunk, any more than the chameleon reproduces the colors of its surroundings. The Pink Panther imitates nothing, it reproduces nothing, it paints the world its color, pink on pink; this is its becoming-world, carried out in such a way that it becomes imperceptible itself, *asignifying*, makes its rupture, its own line of flight, follows its "aparallel evolution" through to the end. The wisdom of the plants: even when they have roots, there is always an outside where they form a rhizome with something else - with the wind, an animal, human beings (and there is also an aspect under which animals themselves form rhizomes, as do people, etc.). "Drunkenness as a triumphant irruption of the plant in us." Always follow the rhizome by rupture; lengthen, prolong, and relay the line of flight; make it vary, until you have produced the most abstract and tortuous of lines of *n* dimensions and broken directions. Conjugate deterritorialized flows. Follow the plants: you start by delimiting a first line consisting of circles of convergence around successive singularities; then you see whether inside that line new circles of conver-

gence establish themselves, with new points located outside the limits and in other directions. Write, form a rhizome, increase your territory by deterritorialization, extend the line of flight to the point where it becomes an abstract machine covering the entire plane of consistency. "Go first to your old plant and watch carefully the watercourse made by the rain. By now the rain must have carried the seeds far away. Watch the crevices made by the runoff, and from them determine the direction of the flow. Then find the plant that is growing at the farthest point from your plant. All the devil's weed plants that are growing in between are yours. Later... you can extend the size of your territory by following the watercourse from each point along the way."⁴ Music has always sent out lines of flight, like so many "transformational multiplicities," even overturning the very codes that structure or arborify it; that is why musical form, right down to its ruptures and proliferations, is comparable to a weed, a rhizome. ...

In contrast to centered (even polycentric) systems with hierarchical modes of communication and preestablished paths, the rhizome is an acentered, nonhierarchical, nonsignifying system without a General and without an organizing memory or central automaton, defined solely by a circulation of states. What is at question in the rhizome is a relation to sexuality - but also to the animal, the vegetal, the world, politics, the book, things natural and artificial - that is totally different from the arborescent relation: all manner of "becomings."

A plateau is always in the middle, not at the beginning or the end. A rhizome is made of plateaus. Gregory Bateson uses the word "plateau" to designate something very special: a continuous, self-vibrating region of intensities whose development avoids any orientation toward a culmination point or external end. Bateson cites Balinese culture as an example: mother-child sexual games, and even quarrels among men, undergo this bizarre intensive stabilization. "Some sort of continuing plateau of intensity is substituted for [sexual] climax, war, or a culmination point. It is a regrettable characteristic of the Western mind to relate expressions and actions to exterior or transcendent ends, instead of evaluating them on a plane of consistency on the basis of their intrinsic value."⁶ For example, a book composed of chapters has culmination and termination points. What takes place in a book composed instead of plateaus that communicate with one another across microfissures, as in a brain? We call a "plateau" any multiplicity connected to other multiplicities by superficial underground stems in such a way as to form or extend a rhizome. We are writing this book as a rhizome. It is composed of plateaus. We have given it a circular form, but only for laughs. Each morning we would wake up, and each of us would ask himself what plateau he was going to tackle, writing five lines here, ten there. We had hallucinatory experiences, we watched lines leave one plateau and proceed to another like columns of tiny ants. We made circles of convergence. Each plateau can be read starting anywhere and can be related to any other plateau. To attain the multiple, one must have a method that effectively constructs it; no typographical cleverness, no lexical agility, no blending or creation of words, no syntactical boldness, can substitute for it. In fact, these are more often than not merely mimetic procedures used to disseminate or disperse a unity that is retained in a different dimension for an image-book. Technonarcissism. Typographical, lexical, or syntactic creations are necessary only when they no longer belong to the form of expression of a hidden unity, becoming themselves dimensions of the multiplicity under consideration; we only know of rare successes in this. We ourselves were unable to do it. We

just used words that in turn function for us as plateaus, RHIZOMATICS = SCHIZO-ANALYSIS = STRATOANALYSIS = PRAGMATICS = MICROPOLITICS. These Words are concepts, but concepts are lines, which is to say, number systems attached to a particular dimension of the multiplicities (strata, molecular chains, lines of flight or rupture, circles of convergence, etc.). Nowhere do we claim for our concepts the title of a science. We are no more familiar with scientificity than we are with ideology; all we know are assemblages. And the only assemblages are machinic assemblages of desire and collective assemblages of enunciation. No *signifiante*, no subjectification: writing to the *nth*. power (all individuated enunciation remains trapped within the dominant significations, all signifying desire is associated with dominated subjects). An assemblage, in its multiplicity, necessarily acts on semiotic flows, material flows, and social flows simultaneously (independently of any recapitulation that may be made of it in a scientific or theoretical corpus). There is no longer a tripartite division between a field of reality (the world) and a field of representation (the book) and a field of subjectivity (the author). Rather, an assemblage establishes connections between certain multiplicities drawn from each of these orders, so that a book has no sequel nor the world as its object nor one or several authors as its subject. In short, we think that one cannot write sufficiently in the name of an outside. The outside has no image, no signification, no subjectivity. The book as assemblage with the outside, against the book as image of the world. A rhizome-book, not a dichotomous, pivotal, or fascicular book. Never send down roots, or plant them, however difficult it may be to avoid reverting to the old procedures. "Those things which occur to me, occur to me not from the root up but rather only from somewhere about their middle. Let someone then attempt to seize them, let someone attempt to seize a blade of grass and hold fast to it when it begins to grow only from the middle." Why is this so difficult? The question is directly one of perceptual semiotics. It's not easy to see things in the middle, rather than looking down on them from above or up at them from below, or from left to right or right to left: try it, you'll see that everything changes. It's not easy to see the grass in things and in words (similarly, Nietzsche said that an aphorism had to be "ruminated"; never is a plateau separable from the cows that populate it, which are also the clouds in the sky).

History is always written from the sedentary point of view and in the name of a unitary State apparatus, at least a possible one, even when the topic is nomads. What is lacking is a Nomadology, the opposite of a history ____ Even in the realm of theory, especially in the realm of theory, any precarious and pragmatic framework is better than tracing concepts, with their breaks and progress changing nothing. Imperceptible rupture, not signifying break ____ The nomads invented a war machine in opposition to the State apparatus. History has never comprehended nomadism, the book has never comprehended the outside. The State as the model for the book and for thought has a long history: logos, the philosopher-king, the transcendence of the Idea, the interiority of the concept, the republic of minds, the court of reason, the functionaries of thought, man as legislator and subject. The State's pretension to be a world order, and to root man. The war machine's relation to an outside is not another "model"; it is an assemblage that makes thought itself nomadic, and the book a working part in every mobile machine, a stem for a rhizome (Kleist and Kafka against Goethe) ____

A rhizome has no beginning or end; it is always in the middle, between things, interbeing, *intermezzo*. The tree is filiation, but the rhizome is alliance, uniquely

alliance. The tree imposes the verb "to be," but the fabric of the rhizome is the conjunction, "and ... and... and..." This conjunction carries enough force to shake and uproot the verb "to be." Where are you going? Where are you coming from? What are you heading for? These are totally useless questions. Making a clean slate, starting or beginning again from ground zero, seeking a beginning or a foundation -all imply a false conception of voyage and movement (a conception that is methodical, pedagogical, initiatory, symbolic...). But Kleist, Lenz, and Buchner have another way of traveling and moving: proceeding from the middle, through the middle, coming and going rather than starting and finishing. American literature, and already English literature, manifest this rhizomatic direction to an even greater extent; they know how to move between things, establish a logic of the AND, overthrow ontology, do away with foundations, nullify endings and beginnings. They know how to practice pragmatics. The middle is by no means an average; on the contrary, it is where things pick up speed. *Between* things does not designate a localizable relation going from one thing to the other and back again, but a perpendicular direction, a transversal movement that sweeps one *and* the other away, a stream without beginning or end that undermines its banks and picks up speed in the middle...

Psychoanalysis and Psychology

Introduction: Strangers to Ourselves: Psychoanalysis

Julie Rivkin and Michael Ryan

A picture of the human mind as a unified whole that can achieve full awareness of itself has been central to western thought since the seventeenth century. The "cogito" or thinking self defines our humanity and our civility, our difference from animals chained to blind nature and uncontrollable instincts. In the early part of the twentieth century, the assurance of that self-description was disturbed by Sigmund Freud's book, *The Interpretation of Dreams* (1900), which described a discovery that would become the centerpiece of a new discipline called psychoanalysis. His discovery was that the human mind contains a dimension that is only partially accessible to consciousness and then only through indirect means such as dreams or neurotic symptoms. The "unconscious," as he called it, is a repository of repressed desires, feelings, memories, and instinctual drives, many of which, according to Freud, have to do with sexuality and violence. In subsequent books and studies such as *Beyond the Pleasure Principle*, "A Case of Infantile Neurosis," *Three Essays on Sexuality*, *The Ego and the Id*, and *The Psychopathology of Everyday Life*, Freud argued that our mental lives derive largely from biological drives, that the highest achievements and ideals of civilization are inseparable from instinctual urges toward pleasure, constancy, and the release of excitation and energy. As each child grows and enters first the family then society, he or she learns to repress those instinctual drives and the conscious desires they instigate and to mold aggressive and sexual impulses as well as an initially grandiose sense of self to the demands of life with others. Repression is essential to civilization, the conversion of animal instinct into civil behavior, but such repression creates what might be called a second self, a stranger within, a place where all that cannot for one reason or another be expressed or realized in civil life takes up residence. This, for Freud, explains why people experience what he calls "uncanny" feelings of doubleness that consist of a sense that something strange coexists with what is most familiar inside ourselves. It also explains why we compulsively repeat certain gestures, desires, experiences, and self-induced situations that might be quite distressing but also compellingly unavoidable. We cannot help but do so because they are brought about by forces and drives within ourselves over which we exercise very little conscious control because they arise from something or somewhere that is beyond our control - the unconscious.

Freud discovered the unconscious by studying patients with neurotic symptoms which pointed towards unresolved conflicts between unconscious inclinations or

feelings and the repressive demands of the ego or conscious self. He noticed that such patients engaged in behavior that frequently embodied desires or fears (persistent phobic anxiety about animals, for example) whose repetitiveness suggested that the patient was in the grip of something outside his awareness or her control. Freud borrowed from his teacher Josef Breuer a method of analysis whereby patients would say whatever came to their minds regardless of how seemingly meaningless or unimportant. In this way, he found that patients divulged thoughts and feelings that had been kept repressed in the unconscious and hidden from the patient's own conscious view. One patient, for example, experienced a recurring fear of animals that turned out, through his free associations or thoughts, to refer to his childhood fear of his father, something he had repressed and forgotten.

In studying his patients, Freud realized that the unconscious often expresses itself in the form of dreams, since at night during sleep, the vigilance of the repressive ego in regard to unconscious desire is stilled. Dreams, Freud found, express wishes or desires that cannot find expression in waking life precisely because they are at odds with the requirements of the ego, which itself merely registers the requirements of the larger society. Unconscious wishes can find expression in dreams because dreams distort the unconscious material and make it appear different from itself and more acceptable to consciousness. The "dream work" displaces unacceptable material onto acceptable images, condenses several different though related unconscious elements into a single image, and turns drives into their opposites, so that they can elude censorship. A dream about not being able to serve a smoked salmon dinner to a friend might turn out to have nothing to do with dining but instead might refer to a wish not to help the friend gain weight and become more attractive to one's husband, who that very day, before the dream, mentioned how attractive he found the friend to be precisely because of her plumpness.

A similar process is at work, Freud discovered, in neurotic symptoms. They frequently displace desires, or anxieties, or drive energies that are unconscious onto expressive activities or compulsive thoughts. Such symptoms perform a variety of transmutative procedures on unconscious material, from compromise formation (the construction of an indirect expression that allows release of unacceptable drive energy while nonetheless honoring the imperatives of repression) to inversion (the conversion into its opposite of a desire or impulse). For example, someone raised in a strongly religious way that proscribes sexual activity may perform forbidden sexual acts ritualistically so as to seem to be respecting the norm while nonetheless attaining satisfaction. Or someone who feels great animosity toward a cold and distant mother may convert that feeling into its opposite, a fantasy that all women are themselves hostile and therefore unworthy of his love.

Other important terms in the study of symptom formation are fixation, splitting, introjection, and projection. Anxiety about entry into an adult world perceived as threatening of a too fragile sense of self or anxiety that awakens either troubling memories or drive energies will propel some people to fixate at an early state of development. They will remain attached to early forms of emotional life and sexual activity that are usually surpassed in the transition to adulthood. In some instances, for example, people who fear the passage to genital sexuality will continue to find gratification from other parts of their bodies or other activities than genital sex. Splitting is a way of dealing with anxiety by dividing the object of anxiety in two, one bearing all the negative feeling while the other embodies all the positive feelings

one wishes to substitute for the anxieties the object or situation provokes. Children may, for example, direct all of their aggression or hostility toward one parent while idealizing the other, and such splitting may be as much a response to the trajectory of their own drive energies as to external parental behavior. Finally, introjection and projection are terms used to describe how the self shapes itself by adapting models from outside itself and externalizes its own feelings by assigning them to others. If introjection brings in something from someone else, creating an ideal of that person within oneself, projection throws out something from within oneself and makes it seem as if it is a trait of someone else.

Freud spent most of his life studying the boundary and the dynamic movements between the conscious self or ego and the unconscious, which he later came to call the id. The id is the site of the energy of the mind, energy that Freud characterized as a combination of sexual libido and other instincts, such as aggression, that propel the human organism through life, moving it to grow, develop, and eventually to die. That primary process of life is entirely irrational, and it cannot distinguish images and things, reasonable objects and unreasonable or socially unacceptable ones. It is the secondary processes of the mind, lodged in the ego and superego or conscience, that bring reason, order, logic, and social acceptability to the otherwise uncontrolled and potentially harmful realm of the biological drives. But, according to Freud, the drives of the unconscious, though repressed, can never be quelled entirely. They emerge in dreams, and, when the rational part of the mind fails to handle them successfully, in the seemingly irrational behavior that is neurotic symptomatology (the fears, unjustified anxieties, and compulsive behaviors that indicate something out of joint in a personality). When conscious control breaks down altogether and drives and unconscious content are expressed directly, without any mediation by consciousness, one is in the realm of psychosis or schizophrenia, which Freud distinguished from neurosis by saying that neurosis maintains the relationship to an external reality while in psychosis that relationship breaks down altogether.

Freud insisted that sexuality was evident throughout life, from childhood on. The energy of sexuality is far from exclusively genital; it can also be anal or oral, Freud noted, and it can also be displaced onto fetish objects or substitutes that replace early desired objects with ones that avoid anxiety or are responses to trauma. In one famous case study, Freud analyzed an obsessional neurotic (known as the "Wolf Man" because of a dream he had about wolves in a tree staring at him) who developed a sexually invested fondness for military dress and regimen in response to early traumatic experiences regarding his sexual identity. His anxiety provoked him to displace his sexual drive away from human objects and onto fetish substitutes.

At the core of Freud's sexual theory is the so-called "Oedipus Complex," something Freud believed all children experience as a rite of passage to adult gender identity. As befitted his time, Freud was primarily concerned with the Oedipal trajectory of the male child (hence Oedipus rather than, say, Clytemnestra or Medea). All male children, Freud argued, experience an early attachment to the mother that is sexual in nature. Only the father's intervention, separating mother from child, prevents incest. All civilization is founded on the prohibition expressed in the father's intervention. The male child learns to give up his initial "pre-Oedipal" desire for and attachment to the mother; instead, he identifies with the father (instead of longing to be the father with his mother) and learns to desire other women than the mother. He becomes an adult male heterosexual (Freud's implicit norm).

Similarly, the female child experiences an early desire for the father which takes the form of a simultaneous desire to *be* her mother, to take her place as the father's sexual object, but she too learns to relinquish that desire and to identify with her mother and to seek other objects outside the family. The crucial process in gender formation is identification, the molding of a self from equations made between oneself and external objects through the internalization of images or models of those objects.

Psychoanalytic theory after Freud divides into two strands, one called object relations, the other neo-Freudianism. While object relations theory favors a model that does without instincts almost altogether and concentrates instead on the way the self interacts with its social world, especially the initial world of primary caretakers such as the mother, neo-Freudian theory in the work of Jacques Lacan especially argues that the instinctual drives and the unconscious are more essential to psychoanalytic work than the ego, which Lacan sees as a mirage that can never fully know and master the unconscious.

The theory of identification, which places greater emphasis on social relations at the expense of the instinctual drives, was especially appealing to the object relations school of psychoanalysis that came into being after World War II in Britain and America and is associated with such names as Melanie Klein, D. W. Winnicott, and Margaret Mahler. It is concerned less with the battle between the ego and the instinctual drives, a notion that some of the theorists reject outright, than it is with the way the relations between the child and its objects, especially the mother, during the pre-Oedipal period, shape its personality. The contours of self-identity are given or shaped by that primary relationship, by whether or not it is distant, cold, and frustrating, for example, or overwhelming and engulfing. The child's ability to separate successfully from its primary unity with the mother by building self-boundaries and appropriate mental representations of an external object world will determine what kind of personality he or she will possess - be it one yearning for fusion with objects that never fully satisfy its yearning or one dominated by a feeling of being compelled to flee from relationships that threaten to overwhelm its fragile self-boundaries.

Unlike Freud, object relations theorists consider the ego to be a major part of (if not the entire) personality. How it manages to construct an internal world for itself made up of introjected fantasy objects or projections of destructive feelings onto the world during the "pre-Oedipal" stage of development is more important for such theorists than the later Oedipal stage of passage into adult gender identity. Some consider the original separation from the mother to be a primary frustration that can never be assuaged; life's longings are defined by its schema. Others like Margaret Mahler see the relation to the mother more positively as providing a "beacon" that allows the child to emerge into the world from a primary symbiotic state. And others like Melanie Klein see the child constructing a world for itself through fantasies that allow it to distinguish its destructive from its affectionate feelings through introjection/projection and the splitting between good and bad internal objects. For a child, the mother consists of "part objects" like the breast or the face. Ultimately, the child learns to engage in "reparation," the restoration of whole objects and good relations that its own destructive impulses sundered during the process of separation, individuation, and growth. While object relations theory has been criticized for at times advancing an overly optimistic picture of "adaptation" of a debatably coherent "self"

to an unproblematic "environment," it has also inspired such pathbreaking work as Klaus Theweleit's *Male Fantasies*, a study of pre-Nazi literature that locates the origins of Nazism in a particular psychological formation that perceived women, communists, and Jews as external equivalents of internal boundary-threatening urges that had to be either violently expelled or regimented.

Neo-Freudianism enjoyed great popularity in France in the 1960s and 1970s and continues to be a viable school of literary criticism. In the 1950s and 1960s, Lacan developed a structuralist theory of psychoanalysis based on the linguistic theory of Saussure. Against object relations theory, Lacan argues that the ego is constructed through imaginary percepts and narcissistic fantasies, and it remains blind to its determination by the drives, the unconscious, and its placement and construction in/ by language. Before language assigns us an "I," we possess no sense of self. It is language that gives us identity (while simultaneously taking it away in the sense of something pre-given or internal). The unified self posited by object relations theory is an illusion. The child begins as fragmented drives, percepts, and attachments that eventually congeal into an imaginary identity at the "mirror stage" of development. It is through the child's original symbiotic relationship with the mother that he/she develops a false narcissistic sense of unity. The child assumes the mother is himself, and his primary desire is for her desire (of him). Desire and its realization only appear immediate, however, and what Lacan calls the Real, an impossible wholeness of self, plenitude of desire satisfaction (*jouissance*), and continuity of signifier and signified or word and object, is never possible. The mother is a congeries of part objects (*l'objet petit a*) and partial fulfillments like the breast, and the whole we imaginarily seek and imagine we have when we construct egos for ourselves is merely a way of concealing from ourselves the initial fissure or *beance* that separation from her installs permanently within our being. Indeed, our being is not founded on the mythic identity of the ego; rather it is founded on what Lacan calls our initial lack-of-being (*manque-d-etre*), the initial experience of being ripped out of an original imaginary fullness of being and separated from the object - the mother - that provided us with it. More real is our overdetermination by the drives, the unconscious, and the Symbolic Order of our culture, the social languages that identify us and lend us identities, all of which exceed consciousness and never assume the form of knowable or conscious identity (which, for Lacan, is always fantasmatic). Our identity is given to us from outside, and we are constitutively alienated. The imaginary or narcissistic character of all desire merely conceals this basic fault, this radical alterity or otherness, in human existence.

The mirror stage of dyadic symbiosis with the mother must be left behind as the child develops and enters that social world. The shattering of it occurs when the child is confronted with the father's "no," which is to say, with the incest taboo that declares the mother an inappropriate object. The child then learns to accept his/her place in the Symbolic Order, that symbolic language which assigns social roles and dictates proper behavior in society. That order is like a language, since it is defined as relations between terms (mother/father, mother/son, etc.) and by a lexicon that assigns meaning or identity according to the binary opposition of presence or absence (of terms). With the initiation of the Symbolic, the original desire for the mother is repressed, and Lacan compares this to the way the signified is made absent by the signifier, and is always beneath the bar in Saussure's algorithm: S/s. The acceptance of repression and the entry into the Symbolic is itself comparable to language in that

once one learns to name something, one accepts separation from it; by naming, one sacrifices the object, since the presence of the sign/word is the absence of the signified thing. The naming of objects separates one from them. The arrival of the Symbolic and the shattering of the Imaginary thus consists of the installation of a combined linguistic/psychological separation of the child both from its initial object, the mother, and from the undifferentiated matter of natural existence. We learn to be social, to have social identities, by learning to say no, to sacrifice or give up both the initial contact one has with the natural world and with one's first human objects. The mother's body is barred, and the desire for it is placed under the bar of the signifier and enters the unconscious. The small "o" other or initial object becomes the large "O" Other of the symbolic unconscious; it acquires meaning as what one cannot have and as that whose absence dictates the form of all subsequent desires, all the signifiers we pursue as hoped-for fillers for an initial unfillable absence. That bar can never be crossed, and all our desires throughout life will consist of attempts to come to terms with this separation, our "lack-of-being." The other side of the bar can enter our consciousness only in the form of substitutes, as metaphors that can indicate it only as/in its absence because the unconscious can never be present to the mind (except through substitute signifiers). Similarly, all desire is inherently meta-phoric, inherently a matter of a substitute object that stands in for the initially absent mother object, and because no metaphor can embody what we ultimately desire when we desire anything, we are condemned to slide along a chain of signifiers each of which is a metonymy, a part standing in for the whole we (always) miss. Thus, unlike object relations theory, which assumes a whole self is possible that would be transparent to itself and would be defined by a healthy ego, Lacan thinks that we are constitutively split from ourselves and that we can never possibly attain wholeness in the world of objects. That is a delusion of the ego (and of ego psychology, he would add, somewhat polemically). What we can learn is to accept frustration and to come to acknowledge the lack that defines our being. We exist in a chain of signifiers of desires that never arrive at the Real, the ever absent cause of desire which is the undifferentiatedness of nature, something we can never have access to from within society except through signifiers that distance it (substitute for it) as they name it.

Psychoanalytic literary criticism begins with Freud himself, whose "The Uncanny," in part a reading of Hoffman's horror story "The Sandman," can be said to inaugurate the critical genre. Freud notices that literary texts are like dreams; they embody or express unconscious material in the form of complex displacements and condensations. The same rule that he prescribes for dream interpretation, however, also applies to literature: it is not a direct translation of the unconscious into symbols that "stand for" unconscious meanings. Rather, literature displaces unconscious desires, drives, and motives into imagery that might bear no resemblance to its origin but that nonetheless permits it to achieve release or expression. Literature, as fiction, might even be said to demonstrate these very processes of representation-through-indirection at work. For Freud in "The Uncanny," fear of castration takes the form not of a literal image, but of a metaphoric substitute that displaces the protagonist's anxiety onto a fear of losing his eyes, a fear that is available for interpretation only because language displays the latent connection.

Freud and many later psychoanalytic critics were concerned with what they thought was the primary anxiety of patriarchal culture, the male child's fears as he moves from presexual childhood to sexual adulthood, a trajectory that necessarily

crosses the sexual relationship between his mother and his father. All of Nathaniel Hawthorne's fiction, for example, might be read in this light as embodying the Oedipal conflict between a son and a threatening father (as between Reverend Dimmesdale and Chillingworth in *The Scarlet Letter*). As object relations theory shifts attention toward the pre-Oedipal realm, however, so also does later psychoanalytic criticism focus more on the relational dynamics of psychosexual development and on children's relations to their mothers in patrocultural cultures that assign child-rearing work to women. Klaus Theweleit in *Male Fantasies*, for example, studies the representations of violence against women in literature by German ex-soldiers from World War I who would eventually become major supporters of Nazism and interprets them as expressions of hostility against mothers. The literary works are characterized by images of fear in regard to women perceived as being too powerful, fear that is displaced onto anxieties about having one's self-boundaries overwhelmed by a "red flood" of Bolshevism. Nazism would be the German response to that political threat of communist revolution, an erection of a rigid social order that was the equivalent of the psychological defense these males constructed to guard themselves against personal dissolution, what Theweleit calls "body armor." Theweleit sees the relation to the mother as more determining of these men's psychological identities than that to the father, who tends to be a peripheral figure in the literature. At stake in the literature is not an ego that does battle with a paternal superego or with unconscious urges for pleasure that meet repression; rather the literature depicts a self that never fully formed, never acquired a healthy relation to the world, because of abusive child-rearing practices in German society at the time. It is this that accounts for the enormous representational violence against women who might be construed as similarly maternal and similarly abusive of self-identity.

Lacanian criticism shifts attention to language and sees it and the unconscious as almost identical. Human desire is carried by signifiers which stand in for a lack that can never be filled in. It is in the signifiers then, in language itself, that the unconscious, what of the unconscious one can know, resides. Processes of signification of the kind that are frozen temporarily in works of literature constitute the human subject and determine the shape of its life - whether one neurotically and repetitively pursues the same signifier of a possibly completely fulfilled desire (a particular kind of sexual partner) or whether one renounces such pursuits and accommodates oneself to a more mundane destiny, for example. Such fulfillment is, of course, for Lacan, an impossibility; so literature always enacts the way the chain of signifiers simply eternally displaces an end to signification, the arrival of a real referent that would be the fulfillment of desire and the end of its displacement along a chain.

For example, Hemingway's novel *A Farewell to Arms* hinges on a play on words in the title. About a wounded soldier who has an affair with a nurse who dies in the end while giving birth to their child (itself stillborn), *Arms* is about both bodily "arms" (as in the sexual embrace) and military "arms" (as in the guns that wound Jake, the hero). He wishes to escape from the military into the arms of the maternal Catherine, but he is obliged to say farewell to her arms in the end. The novel maps out the trajectory of development as Lacan describes it: the male child must learn to renounce the imaginary moment of fulfilled desire with the mother in order to accept separation and to enter the Symbolic Order. The bifurcating meanings of "arms" indicate a split in the narrative subject (the narrator shifts from "we" to "I" throughout) that testifies to the split within all human subjectivity between the

conscious self and the unconscious that determines that self and between the desiring self and the ultimately impossible fulfillment of that desire (in a return to the mother's arms). The imaginary identity (of self/(m)other) must be given up, and separation (the duality of meaning implied by the fact that one can only have metaphors and not real things or complete fulfillment) accepted.¹

Note

The Interpretation of Dreams

Sigmund Freud

When it was published in 1900, Freud's *Interpretation of Dreams* launched an entirely new idea and a new discipline of human knowledge. The idea was that the mind harbors wishes or desires that lie outside awareness but that nevertheless manifest themselves at night in dreams. Dreams, when read or interpreted as a rebus or puzzle, instead of being taken literally, turn out to be translations into semi-conscious form of unconscious material. Such material is generally in the unconscious because it has been repressed, or driven from consciousness by a mental censor that judges what is fit for expression. Things unfit for expression (at the time of Freud's work) were ideas or desires having to do, for example, with sexuality. But not all dreams were of a sexual character. In the central dream analyzed in this selection, Freud, for example, has a dream that expresses an egotistical wish that his work be properly recognized.

The Dream of the Botanical Monograph

I had written a monograph on a certain plant. The book lay before me and I was at the moment turning over a folded colored plate. Bound up in each copy there was a dried specimen of the plant, as though it had been taken from a herbarium.

Analysis

That morning I had seen a new book in the window of a book-shop, bearing the title *The Genus Cyclamen* - evidently a *monograph* on that plant.

Cyclamens, I reflected, were my *wife's favorite flowers* and I reproached myself for so rarely remembering to *bring her flowers*, which was what *she* liked. - The subject of "*bringing flowers*" recalled an anecdote which I had recently repeated to a circle of friends and which I had used as evidence in favor of my theory that forgetting is very often determined by an unconscious purpose and that it always enables one to deduce the secret intentions of the person who forgets. A young woman was accustomed to receiving a bouquet of flowers from her husband on her birthday. One year this token of his affection failed to appear, and she burst into tears. Her husband came in and had no idea why she was crying till she told him that to-day was her birthday. He clasped his hand to his head and exclaimed: "I'm so sorry, but I'd quite forgotten. I'll go out at once and fetch *your flowers*." But she was not to be consoled; for she recognized that her husband's forgetfulness was a proof that she no longer had the same place in his thoughts as she had formerly. - This lady, Frau L., had met

my wife two days before I had the dream, had told her that she was feeling quite well and enquired after me. Some years ago she had come to me for treatment.

I now made a fresh start. Once, I recalled, I really *had* written something in the nature of a *monograph on a plant*, namely a dissertation on the *coca-plant*, which had drawn Karl Koller's attention to the anaesthetic properties of cocaine. I had myself indicated this application of the alkaloid in my published paper, but I had not been thorough enough to pursue the matter further. This reminded me that on the morning of the day after the dream - I had not found time to interpret it till the evening - I had thought about cocaine in a kind of daydream. If ever I got glaucoma, I had thought, I should travel to Berlin and get myself operated on, incognito, in my friend's [Fliess's] house, by a surgeon recommended by him. The operating surgeon, who would have no idea of my identity, would boast once again of how easily such operations could be performed since the introduction of cocaine; and I should not give the slightest hint that I myself had had a share in the discovery. This phantasy had led on to reflections of how awkward it is, when all is said and done, for a physician to ask for medical treatment for himself from his professional colleagues. The Berlin eye-surgeon would not know me, and I should be able to pay his fees like anyone else. It was not until I had recalled this daydream that I realized that the recollection of a specific event lay behind it. Shortly after Koller's discovery, my father had in fact been attacked by glaucoma; my friend Dr Konigstein, the ophthalmic surgeon, had operated on him; while Dr Koller had been in charge of the cocaine anaesthesia and had commented on the fact that this case had brought together all of the three men who had had a share in the introduction of cocaine.

My thoughts then went on to the occasion when I had last been reminded of this business of the cocaine. It had been a few days earlier, when I had been looking at a copy of a *Festschrift* in which grateful pupils had celebrated the jubilee of their teacher and laboratory director. Among the laboratory's claims to distinction which were enumerated in this book I had seen a mention of the fact that Koller had made his discovery there of the anaesthetic properties of cocaine. I then suddenly perceived that my dream was connected with an event of the previous evening. I had walked home precisely with Dr Konigstein and had got into conversation with him about a matter which never fails to excite my feelings whenever it is raised. While I was talking to him in the entrance-hall, Professor Gartner [Gardener] and his wife had joined us; and I could not help congratulating them both on their *blooming* looks. But Professor Gartner was one of the authors of the *Festschrift* I have just mentioned, and may well have reminded me of it. Moreover, the Frau L., whose disappointment on her birthday I described earlier, was mentioned - though only, it is true, in another connection - in my conversation with Dr Konigstein.

I will make an attempt at interpreting the other determinants of the content of the dream as well. There was a *dried specimen of the plant* included in the monograph, as though it had been a *herbarium*. This led me to a memory from my secondary school. Our headmaster once called together the boys from the higher forms and handed over the school's herbarium to them to be looked through and cleaned. Some small worms - book-worms - had found their way into it. He does not seem to have had much confidence in my helpfulness, for he handed me only a few sheets. These, as I could still recall, included some Crucifers. I never had a specially intimate contact with botany. In my preliminary examination in botany I was also given a Crucifer to identify - and failed to do so. My prospects would not have been too bright, if I had

not been helped out by my theoretical knowledge. I went on from the Cruciferae to the Compositae. It occurred to me that artichokes were Compositae, and indeed I might fairly have called them *my favorite flowers*. Being more generous than I am, my wife often brought me back these favorite flowers of mine from the market.

I saw the monograph which I had written *lying before me*. This again led me back to something. I had had a letter from my friend [Fliess] in Berlin the day before in which he had shown his power of visualization; "I am very much occupied with your dream-book. / see it *lying finished before me and I see myself turning over its pages.*" How much I envied him his gift as a seer! If only I could have seen it lying finished before me!

The folded colored plate. While I was a medical student I was the constant victim of an impulse only to learn things out of *monographs*. In spite of my limited means, I succeeded in getting hold of a number of volumes of the proceedings of medical societies and was enthralled by their *colored plates*. I was proud of my hankering for thoroughness. When I myself had begun to publish papers, I had been obliged to make my own drawings to illustrate them and I remembered that one of them had been so wretched that a friendly colleague had jeered at me over it. There followed, I could not quite make out how, a recollection from very early youth. It had once amused my father to hand over a book with *colored plates* (an account of a journey through Persia) for me and my eldest sister to destroy. Not easy to justify from the educational point of view! I had been five years old at the time and my sister not yet three; and the picture of the two of us blissfully pulling the book to pieces (leaf by leaf, like an *artichoke*, I found myself saying) was almost the only plastic memory that I retained from that period of my life. Then, when I became a student, I had developed a passion for collecting and owning books, which was analogous to my liking for learning out of monographs: *a favorite hobby*. (The idea of "*favorite*"¹⁷ had already appeared in connection with cyclamens and artichokes.) I had become a *bookworm*. I had always, from the time I first began to think about myself, referred this first passion of mine back to the childhood memory I have mentioned. Or rather, I had recognized that the childhood scene was a "screen memory" for my later bibliophile propensities.

And I had early discovered, of course, that passions often lead to sorrow. When I was seventeen I had run up a largish account at the bookseller's and had nothing to meet it with; and my father had scarcely taken it as an excuse that my inclinations might have chosen a worse outlet. The recollection of this experience from the later years of my youth at once brought back to my mind the conversation with my friend Dr Königstein. For in the course of it we had discussed the same question of my being blamed for being too much absorbed in my *favorite hobbies*.

For reasons with which we are not concerned, I shall not pursue the interpretation of this dream any further, but will merely indicate the direction in which it lay. In the course of the work of analysis I was reminded of my conversation with Dr Königstein, and I was brought to it from more than one direction. When I take into account the topics touched upon in that conversation, the meaning of the dream becomes intelligible to me. All the trains of thought starting from the dream - the thoughts about my wife's and my own favorite flowers, about cocaine, about the awkwardness of medical treatment among colleagues, about my preference for studying monographs and about my neglect of certain branches of science such as botany - all of these trains of thought, when they were further pursued, led ultimately to one

or other of the many ramifications of my conversation with Dr Königstein. Once again the dream, like the one we first analyzed - the dream of Irma's injection - turns out to have been in the nature of a self-justification, a plea on behalf of my own rights. Indeed, it carried the subject that was raised in the earlier dream a stage further and discussed it with reference to fresh material that had arisen in the interval between the two dreams. Even the apparently indifferent form in which the dream was couched turns out to have had significance. What it meant was: "After all, I'm the man who wrote the valuable and memorable paper (on cocaine)," just as in the earlier dream I had said on my behalf: "I'm a conscientious and hard-working student." In both cases what I was insisting was: "I may allow myself to do this." ...

The Dream-work

Every attempt that has hitherto been made to solve the problem of dreams has dealt directly with their *manifest* content as it is presented in our memory. All such attempts have endeavored to arrive at an interpretation of dreams from their manifest content or (if no interpretation was attempted) to form a judgement as to their nature on the basis of that same manifest content. We are alone in taking something else into account. We have introduced a new class of psychical material between the manifest content of dreams and the conclusions of our enquiry: namely, their *latent* content, or (as we say) the "dream-thoughts," arrived at by means of our procedure. It is from these dream-thoughts and not from a dream's manifest content that we disentangle its meaning. We are thus presented with a new task which had no previous existence: the task, that is, of investigating the relations between the manifest content of dreams and the latent dream-thoughts, and of tracing out the processes by which the latter have been changed into the former.

The dream-thoughts and the dream-content are presented to us like two versions of the same subject-matter in two different languages. Or, more properly, the dream-content seems like a transcript of the dream-thoughts into another mode of expression, whose characters and syntactic laws it is our business to discover by comparing the original and the translation. The dream-thoughts are immediately comprehensible, as soon as we have learnt them. The dream-content, on the other hand, is expressed as it were in a pictographic script, the characters of which have to be transposed individually into the language of the dream-thoughts. If we attempted to read these characters according to their pictorial value instead of according to their symbolic relation, we should clearly be led into error. Suppose I have a picture-puzzle, a rebus, in front of me. It depicts a house with a boat on its roof, a single letter of the alphabet, the figure of a running man whose head has been conjured away, and so on. Now I might be misled into raising objections and declaring that the picture as a whole and its component parts are nonsensical. A boat has no business to be on the roof of a house, and a headless man cannot run. Moreover, the man is bigger than the house; and if the whole picture is intended to represent a landscape, letters of the alphabet are out of place in it since such objects do not occur in nature. But obviously we can only form a proper judgement of the rebus if we put aside criticisms such as these of the whole composition and its parts and if, instead, we try to replace each separate element by a syllable or word that can be represented by that element in some way or other. The words which are put together in this way

are no longer nonsensical but may form a poetical phrase of the greatest beauty and significance. A dream is a picture-puzzle of this sort and our predecessors in the field of dream-interpretation have made the mistake of treating the rebus as a pictorial composition: and as such it has seemed to them nonsensical and worthless.

The work of condensation

The first thing that becomes clear to anyone who compares the dream-content with the dream-thoughts is that a work of *condensation* on a large scale has been carried out. Dreams are brief, meagre and laconic in comparison with the range and wealth of the dream-thoughts. If a dream is written out it may perhaps fill half a page. The analysis setting out the dream-thoughts underlying it may occupy six, eight or a dozen times as much space. This relation varies with different dreams; but so far as my experience goes its direction never varies. As a rule one underestimates the amount of compression that has taken place, since one is inclined to regard the dream-thoughts that have been brought to light as the complete material, whereas if the work of interpretation is carried further it may reveal still more thoughts concealed behind the dream. I have already had occasion to point out that it is in fact never possible to be sure that a dream has been completely interpreted. Even if the solution seems satisfactory and without gaps, the possibility always remains that the dream may have yet another meaning. Strictly speaking, then, it is impossible to determine the amount of condensation.

There is an answer, which at first sight seems most plausible, to the argument that the great lack of proportion between the dream-content and the dream-thoughts implies that the psychical material has undergone an extensive process of condensation in the course of the formation of the dream. We very often have an impression that we have dreamt a great deal all through the night and have since forgotten most of what we dreamt. On this view, the dream which we remember when we wake up would only be a fragmentary remnant of the total dream-work; and this, if we could recollect it in its entirety, might well be as extensive as the dream-thoughts. There is undoubtedly some truth in this: there can be no question that dreams can be reproduced most accurately if we try to recall them as soon as we wake up and that our memory of them becomes more and more incomplete towards evening. But on the other hand it can be shown that the impression that we have dreamt a great deal more than we can reproduce is very often based on an illusion, the origin of which I shall discuss later. Moreover the hypothesis that condensation occurs during the dream-work is not affected by the possibility of dreams being forgotten, since this hypothesis is proved to be correct by the quantities of ideas which are related to each individual piece of the dream which has been retained. Even supposing that a large piece of the dream has escaped recollection, this may merely have prevented our having access to another group of dream-thoughts. There is no justification for supposing that the lost pieces of the dream would have related to the same thoughts which we have already reached from the pieces of the dream that have survived.

In view of the very great number of associations produced in analysis to each individual element of the content of a dream, some readers may be led to doubt whether, as a matter of principle, we are justified in regarding as part of the dream-thoughts all the associations that occur to us during the subsequent analysis -whether we are justified, that is, in supposing that all these thoughts were already

active during the state of sleep and played a part in the formation of the dream. Is it not more probable that new trains of thought have arisen in the course of the analysis which had no share in forming the dream? I can only give limited assent to this argument. It is no doubt true that some trains of thought arise for the first time during the analysis. But one can convince oneself in all such cases that these new connections are only set up between thoughts which were already linked in some other way in the dream-thoughts. The new connections are, as it were, loop-lines or short-circuits, made possible by the existence of other and deeper-lying connecting paths. It must be allowed that the great bulk of the thoughts which are revealed in analysis were already active during the process of forming the dream; for, after working through a string of thoughts which seem to have no connection with the formation of a dream, one suddenly comes upon one which is represented in its content and is indispensable for its interpretation, but which could not have been reached except by this particular line of approach. I may here recall the dream of the botanical monograph, which strikes one as the product of an astonishing amount of condensation, even though I have not reported its analysis in full.

How, then, are we to picture psychical conditions during the period of sleep which precedes dreams? Are all the dream-thoughts present alongside one another? or do they occur in sequence? or do a number of trains of thought start out simultaneously from different centers and afterwards unite? There is no need for the present, in my opinion, to form any plastic idea of psychical conditions during the formation of dreams. It must not be forgotten, however, that we are dealing with an *unconscious* process of thought, which may easily be different from what we perceive during purposive reflection accompanied by consciousness.

The unquestionable fact remains, however, that the formation of dreams is based on a process of condensation. How is that condensation brought about?

When we reflect that only a small minority of all the dream-thoughts revealed are represented in the dream by one of their ideational elements, we might conclude that condensation is brought about by *omission*: that is, that the dream is not a faithful translation or a point-for-point projection of the dream-thoughts, but a highly incomplete and fragmentary version of them. This view, as we shall soon discover, is a most inadequate one. But we may take it as a provisional starting-point and go on to a further question. If only a few elements from the dream-thoughts find their way into the dream-content, what are the conditions which determine their selection?

In order to get some light on this question we must turn our attention to those elements of the dream-content which must have fulfilled these conditions. And the most favorable material for such an investigation will be a dream to the construction of which a particularly intense process of condensation has contributed. I shall accordingly begin by choosing for the purpose the dream which I have already recorded.

The dream of the botanical monograph

Content of the Dream. - *I had written a monograph on an (unspecified) genus of plants. The book lay before me and I was at the moment turning over a folded colored plate. Bound up in the copy there was a dried specimen of the plant.*

The element in this dream which stood out most was the *botanical monograph*. This arose from the impressions of the dream-day: I had in fact seen a monograph on the genus *Cyclamen* in the window of a book-shop. There was no mention of this

genus in the content of the dream; all that was left in it was the monograph and its relation to botany. The "botanical monograph" immediately revealed its connection with the *work upon cocaine* which I had once written. From "cocaine" the chains of thought led on the one hand to the *Festschrift* and to certain events in a University laboratory, and on the other hand to my friend Dr Königstein, the eye-surgeon, who had had a share in the introduction of cocaine. The figure of Dr Königstein further reminded me of the interrupted conversation which I had had with him the evening before and of my various reflections upon the payment for medical services among colleagues. This conversation was the actual currently active instigator of the dream; the monograph on the cyclamen was also a currently active impression, but one of an indifferent nature. As I perceived, the "botanical monograph" in the dream turned out to be an "intermediate common entity" between the two experiences of the previous day: it was taken over unaltered from the indifferent impression and was linked with the psychically significant event by copious associative connections.

Not only the compound idea, "botanical monograph," however, but each of its components, "botanical" and "monograph" separately, led by numerous connecting paths deeper and deeper into the tangle of dream-thoughts. "Botanical" was related to the figure of Professor Gartner [Gardener], the *blooming* looks of his wife, to my patient *Flora* and to the lady [Frau L.] of whom I had told the story of the forgotten flowers. Gartner led in turn to the laboratory and to my conversation with Königstein. My two patients [Flora and Frau L.] had been mentioned in the course of this conversation. A train of thought joined the lady with the flowers to my wife's *favorite flowers* and thence to the title of the monograph which I had seen for a moment during the day. In addition to these, "botanical" recalled an episode at my secondary school and an examination while I was at the University. A fresh topic touched upon in my conversation with Dr Königstein - my favorite hobbies - was joined, through the intermediate link of what I jokingly called *my favorite flower*, the artichoke, with the train of thought proceeding from the forgotten flowers. Behind "artichokes" lay, on the one hand, my thoughts about Italy and, on the other hand, a scene from my childhood which was the opening of what have since become my intimate relations with books. Thus "botanical" was a regular nodal point in the dream. Numerous trains of thought converged upon it, which, as I can guarantee, had appropriately entered into the context of the conversation with Dr Königstein. Here we find ourselves in a factory of thoughts where, as in the "weaver's masterpiece," -

Ein Tritt tausend Faden regt,
Die Schiffelein herüber hiniüber schießen,
Die Faden ungesehen fließen,
Ein Schlag tausend Verbindungen schlägt.

So, too, "monograph" in the dream touches upon two subjects: the one-sidedness of my studies and the costliness of my favorite hobbies.

This first investigation leads us to conclude that the elements "botanical" and "monograph" found their way into the content of the dream because they possessed copious contacts with the majority of the dream-thoughts, because, that is to say, they constituted "nodal points" upon which a great number of the dream-thoughts converged, and because they had several meanings in connection with the interpretation of the dream. The explanation of this fundamental fact can also be put in another way:

each of the elements of the dream's content turns out to have been "overdetermined" - to have been represented in the dream-thoughts many times over.

We discover still more when we come to examine the remaining constituents of the dream in relation to their appearance in the dream-thoughts. The *colored plate* which I was unfolding led to a new topic, my colleagues' criticisms of my activities, and to one which was already represented in the dream, my favorite hobbies; and it led, in addition, to the childhood memory in which I was pulling to pieces a book with colored plates. The *dried specimen of the plant* touched upon the episode of the herbarium at my secondary school and specially stressed that memory.

The nature of the relation between dream-content and dream-thoughts thus becomes visible. Not only are the elements of a dream determined by the dream-thoughts many times over, but the individual dream-thoughts are represented in the dream by several elements. Associative paths lead from one element of the dream to several dream-thoughts, and from one dream-thought to several elements of the dream. Thus a dream is not constructed by each individual dream-thought, or group of dream-thoughts, finding (in abbreviated form) separate representation in the content of the dream - in the kind of way in which an electorate chooses parliamentary representatives; a dream is constructed, rather, by the whole mass of dream-thoughts being submitted to a sort of manipulative process in which those elements which have the most numerous and strongest supports acquire the right of entry into the dream-content -. in a manner analogous to election by *scrutin de liste*. In the case of every dream which I have submitted to an analysis of this kind I have invariably found these same fundamental principles confirmed: the elements of the dream are constructed out of the whole mass of dream-thoughts and each one of those elements is shown to have been determined many times over in relation to the dream-thoughts.

It will certainly not be out of place to illustrate the connection between dream-content and dream-thoughts by a further example, which is distinguished by the specially ingenious interweaving of their reciprocal relations. It is a dream produced by one of my patients - a man whom I was treating for claustrophobia. It will soon become clear why I have chosen to give this exceptionally clever dream-production the title of

A lovely dream

He was driving with a large party to X Street, in which there was an unpretentious inn. (This is not the case.) There was a play being acted inside it. At one moment he was audience, at another actor. When it was over they had to change their clothes so as to get back to town. Some of the company were shown into rooms on the ground floor and others into rooms on the first floor. Then a dispute broke out. The ones up above were angry because the ones down below were not ready, and they could not come downstairs. His brother was up above and he was down below and he was angry with his brother because they were so much pressed. (This part was obscure.) Moreover, it had been decided and arranged even when they first arrived who was to be up above and who was to be down below. Then he was walking by himself up the rise made by X Street in the direction of town. He walked with such difficulty and so laboriously that he seemed glued to the spot. An elderly gentleman came up to him and began abusing the King of Italy. At the top of the rise he was able to walk much more easily.

His difficulty in walking up the rise was so distinct that after waking up he was for some time in doubt whether it was a dream or reality.

We should not think very highly of this dream, judging by its manifest content. In defiance of the rules, I shall begin its interpretation with the portion which the dreamer described as being the most distinct.

The difficulty which he dreamt of and probably actually experienced during the dream - the laborious climbing up the rise accompanied by dyspnoea - was one of the symptoms which the patient had in fact exhibited years before and which had at that time been attributed, along with certain other symptoms, to tuberculosis. (The probability is that this was hysterically simulated.) The peculiar sensation of inhibited movement that occurs in this dream is already familiar to us from dreams of exhibiting and we see once more that it is material available at any time for any other representational purpose. The piece of the dream-content which described how the climb began by being difficult and became easy at the end of the rise reminded me, when I heard it, of the masterly introduction to Alphonse Daudet's *Sappho*. That well-known passage describes how a young man carries his mistress upstairs in his arms; at first she is as light as a feather, but the higher he climbs the heavier grows her weight. The whole scene foreshadows the course of their love-affair, which was intended by Daudet as a warning to young men not to allow their affections to be seriously engaged by girls of humble origin and a dubious past. Though I knew that my patient had been involved in a love-affair which he had recently broken off with a lady on the stage, I did not expect to find my guess at an interpretation justified. Moreover the situation in *Sappho* was the *reverse* of what it had been in the dream. In the dream the climbing had been difficult to begin with and had afterwards become easy; whereas the symbolism in the novel only made sense if something that had been begun lightly ended by becoming a heavy burden. But to my astonishment my patient replied that my interpretation fitted in very well with a piece he had seen at the theater the evening before. It was called *Rund um Wien* [Round Vienna] and gave a picture of the career of a girl who began by being respectable, who then became a *demi-mondaine* and had *liaisons* with men in high positions and so "*went up in the world*" but who ended by "*coming down in the world*." The piece had moreover reminded him of another, which he had seen some years earlier, called *Von Stufe zu Stufe* [Step by Step], and which had been advertised by a poster showing a staircase with a flight of *steps*.

To continue with the interpretation. The actress with whom he had had this latest, eventful *liaison* had lived in X Street. There is nothing in the nature of an inn in that street. But when he was spending part of the summer in Vienna on the lady's account he had put up [German "' *abgestiegen*" literally "*stepped down*"] at a small hotel in the neighborhood. When he left the hotel he had said to his cab-driver: "Anyhow I'm lucky not to have picked up any vermin." (This, incidentally, was another of his phobias.) To this the driver had replied: "How could anyone put up at such a place! It's not a hotel, it's only an *inn*."

The idea of an inn at once recalled a quotation to his mind:

Bei einem Wirte wundermild,
Da war ich jüingst zu Gaste.

The host in Uhland's poem was an *apple-tree* and a second quotation now carried on his train of thought:

FAUST (*mit der Jünggen tanzend*): Einst
hatt' ich *einen* *schönen Traum*; Da sah
ich einen *Apfelbaum*, Zwei *schöne*
Äpfel glanzten dran, *Sie* reizten mich,
ich stieg hinan.

DIE SCHÖNE:
Der *Äpfelchen* begehrt ihr sehr, Und
schon vom *Paradiese* her. Von
Freuden fühl' ich mich bewegt, Dass
auch mein *Garten* solche trägt.

There cannot be the faintest doubt what the apple-tree and the apples stood for. Moreover, lovely breasts had been among the charms which had attracted the dreamer to his actress.

The context of the analysis gave us every ground for supposing that the dream went back to an impression in childhood. If so, it must have referred to the wet-nurse of the dreamer, who was by then a man almost thirty years old. For an infant the breasts of his wet-nurse are nothing more nor less than an inn. The wet-nurse, as well as Daudet's Sappho, seem to have been allusions to the mistress whom the patient had recently dropped.

The patient's (elder) brother also appeared in the content of the dream, the brother being up *above* and the patient himself *down below*. This was once again the *reverse* of the actual situation; for, as I knew, the brother had lost his social position while the patient had maintained his. In repeating the content of the dream to me, the dreamer had avoided saying that his brother was up above and he himself "on the ground floor." That would have put the position too clearly, since here in Vienna if we say someone is "*on the ground floor*" we mean that he has lost his money and his position - in other words, that he has "*come down in the world*" Now there must have been a reason for some of this part of the dream being represented by its *reverse*. Further, the reversal must hold good of some other relation between dream-thoughts and dream-content as well; and we have a hint of where to look for this reversal. It must evidently be at the end of the dream, where once again there was a *reversal* of the difficulty in going upstairs as described in *Sappho*. We can then easily see what reversal is intended. In *Sappho* the man carried a woman who was in a sexual relation to him; in the dream-thoughts the position was *reversed*, and a woman was carrying a man. And since this can only happen in childhood, the reference was once more to the wet-nurse bearing the weight of the infant in her arms. Thus the end of the dream made a simultaneous reference to *Sappho* and to the wet-nurse.

Just as the author of the novel, in choosing the name "Sappho," had in mind an allusion to Lesbian practices, so too the pieces of the dream that spoke of people "*up above*" and "*down below*" alluded to phantasies of a sexual nature which occupied the patient's mind and, as suppressed desires, were not without a bearing on his neurosis. (The interpretation of the dream did not itself show us that what were thus represented in the dream were phantasies and not recollections of real events; an analysis only gives us the *content* of a thought and leaves it to us to determine its reality. Real and imaginary events appear in dreams at first sight as of equal validity; and that is so not only in dreams but in the production of more important psychical structures.)

A "large party" meant, as we already know, a secret. His brother was simply the representative (introduced into the childhood scene by a "retrospective phantasy") of all his later rivals for a woman's affection. The episode of the gentleman who abused the King of Italy related once again, via the medium of a recent and in itself indifferent experience, to people of lower rank pushing their way into higher society. It was just as though the child at the breast was being given a warning parallel to the one which Daudet had given to young men.

To provide a third opportunity for studying condensation in the formation of dreams, I will give part of the analysis of another dream, which I owe to an elderly lady undergoing psycho-analytic treatment. As was to be expected from the severe anxiety-states from which the patient suffered, her dreams contained a very large number of sexual thoughts, the first realization of which both surprised and alarmed her. Since I shall not be able to pursue the interpretation of the dream to the end, its material will appear to fall into several groups without any visible connection.

The May-beetle dream

Content of the Dream. — *She called to mind that she had two may-beetles in a box and that she must set them free or they would suffocate. She opened the box and the may-beetles were in an exhausted state. One of them flew out of the open window; but the other was crushed by the casement while she was shutting it at someone's request. (Signs of disgust.)*

Analysis. - Her husband was temporarily away from home, and her fourteen-year-old daughter was sleeping in the bed beside her. The evening before, the girl had drawn her attention to a moth which had fallen into her tumbler of water; but she had not taken it out and felt sorry for the poor creature next morning. The book she had been reading during the evening had told how some boys had thrown a cat into boiling water, and had described the animal's convulsions. These were the two precipitating causes of the dream - in themselves indifferent.

She then pursued the subject of *cruelty to animals* further. Some years before, while they were spending the summer at a particular place, her daughter had been very cruel to animals. She was collecting butterflies and asked the patient for some *arsenic* to kill them with. On one occasion a moth with a pin through its body had gone on flying about the room for a long time; another time some caterpillars which the child was keeping to turn into chrysalises starved to death. At a still more tender age the same child used to tear the wings off *beetles* and butterflies. But to-day she would be horrified at all these cruel actions - she had grown so kind-hearted.

The patient reflected over this contradiction. It reminded her of another contradiction, between appearance and character, as George Eliot displays it in *Adam Bede*: one girl who was pretty, but vain and stupid, and another who was ugly, but of high character; a nobleman who seduced the silly girl, and a working man who felt and acted with true nobility. How impossible it was, she remarked, to recognize that sort of thing in people! Who would have guessed, to look at *her*, that she was tormented by sensual desires?

In the same year in which the little girl had begun collecting butterflies, the district they were in had suffered from a serious plague of *may-beetles*. The children were furious with the beetles and *crushed* them unmercifully. At that time my patient had seen a man who tore the wings off may-beetles and then ate their bodies. She herself had been born in *May* and had been married in *May*. Three days after her

marriage she had written to her parents at home saying how happy she was. But it had been far from true.

The evening before the dream she had been rummaging among some old letters and had read some of them - some serious and some comic - aloud to her children. There had been a most amusing letter from a piano-teacher who had courted her when she was a girl, and another from an admirer *of noble birth*.

She blamed herself because one of her daughters had got hold of a "bad" book by Maupassant. The *arsenic* that the girl had asked for reminded her of the *arsenic pills* which restored the Due de Mora's youthful strength in [Daudet's] *Le Nabob*.

"Set them free" made her think of a passage in the *Magic Flute*:

Zur Liebe kann ich dich nicht zwingen,
Doch geb ich dir *die Freiheit* nicht.

"May-beetles" also made her think of Katchen's words:

Verliebt ja wie ein *Ktifer* bist du mir. And

in the middle of all this came a quotation from *Tannhduser*:

Weil du von *boser Lust* beseelt...

She was living in a perpetual worry about her absent husband. Her fear that something might happen to him on his journey was expressed in numerous waking phantasies. A short time before, in the course of her analysis, she had lighted among her unconscious thoughts upon a complaint about her husband "growing senile." The wishful thought concealed by her present dream will perhaps best be conjectured if I mention that, some days before she dreamt it, she was horrified, in the middle of her daily affairs, by a phrase in the imperative mood which came into her head and was aimed at her husband: "Go and hang yourself!" It turned out that a few hours earlier she had read somewhere or other that when a man is hanged he gets a powerful erection. The wish for an erection was what had emerged from repression in this horrifying disguise. "Go and hang yourself!" was equivalent to: "Get yourself an erection at any price!" Dr Jenkins's arsenic pills in *Le Nabab* fitted in here. But my patient was also aware that the most powerful aphrodisiac, cantharides (commonly known as "Spanish flies"), was prepared from *crushed beetles*. This was the drift of the principal part of the dream's content.

The opening and shutting of *windows* was one of the main subjects of dispute between her and her husband. She herself was aerophilic in her sleeping habits; her husband was aerophobic. *Exhaustion* was the chief symptom which she complained of at the time of the dream ____

The work of condensation in dreams is seen at its clearest when it handles words and names. It is true in general that words are treated in dreams as though they were concrete things, and for that reason they are apt to be combined in just the same way as presentations of concrete things. Dreams of this sort offer the most amusing and curious neologisms.

On one occasion a medical colleague had sent me a paper he had written, in which the importance of a recent physiological discovery was, in my opinion, overestimated,

and in which, above all, the subject was treated in too emotional a manner. The next night I dreamt a sentence which clearly referred to this paper: "*It's written in a positively norekdal style.*" The analysis of the word caused me some difficulty at first. There could be no doubt that it was a parody of the [German] superlatives "*kolossaV* and "*pyramidaF*"; but its origin was not so easy to guess. At last I saw that the monstrosity was composed of the two names "Nora" and "Ekdal" - characters in two well-known plays of Ibsen's. [*A Doll's House* and *The Wild Duck*.] Some time before, I had read a newspaper article on Ibsen by the same author whose latest work I was criticizing in the dream....

VI

Early this morning, between dreaming and waking, I experienced a very nice example of verbal condensation. In the course of a mass of dream-fragments that I could scarcely remember, I was brought up short, as it were, by a word which I saw before me as though it were half written and half printed. The word was "*erzefilisch*," and it formed part of a sentence which slipped into my conscious memory apart from any context and in complete isolation: "That has an *erzefilisch* influence on the sexual emotions." I knew at once that the word ought really to have been "'*erzieheriscW* ["educational"]. And I was in doubt for some time whether the second 'V' in "*erzefilisch*"¹ should not have been an "«'." In that connection the word "syphilis" occurred to me and, starting to analyze the dream while I was still half asleep, I racked my brains in an effort to make out how that word could have got into my dream, since I had nothing to do with the disease either personally or professionally. I then thought of "'*erzehleriscW* [another nonsense word], and this explained the 'V' of the second syllable of "'*erzefilisch*" by reminding me that the evening before I had been asked by our governess [*Erzieherin*] to say something to her on the problem of prostitution, and had given her Hesse's book on prostitution in order to influence her emotional life - for this had not developed quite normally; after which I had talked [*erzdhlte*] a lot to her on the problem. I then saw all at once that the word "syphilis" was not to be taken literally, but stood for "poison" - of course in relation to sexual life. When translated, therefore, the sentence in the dream ran quite logically: "My talk [*Erzählung*] was intended to have an educational [*erzieherisch*] influence on the emotional life of our governess [*Erzieherin*]; but I fear it may at the same time have had a poisonous effect." "*Erzefilisch*" was compounded from "*erzah-*" and "*erzieh-*"

The verbal malformations in dreams greatly resemble those which are familiar in paranoia but which are also present in hysteria and obsessions. The linguistic tricks performed by children, who sometimes actually treat words as though they were objects and moreover invent new languages and artificial syntactic forms, are the common source of these things in dreams and psycho-neuroses alike.

The analysis of the nonsensical verbal forms that occur in dreams is particularly well calculated to exhibit the dream-work's achievements in the way of condensation. The reader should not conclude from the paucity of the instances which I have given that material of this kind is rare or observed at all exceptionally. On the contrary, it is very common. But as a result of the fact that dream-interpretation is dependent upon psycho-analytic treatment, only a very small number of instances are observed and recorded and the analyses of such instances are as a rule only intelligible to

experts in the pathology of the neuroses. Thus a dream of this kind was reported by Dr von Karpinska (1914) containing the nonsensical verbal form: "*Svingnum elvi*." It is also worth mentioning those cases in which a word appears in a dream which is not in itself meaningless but which has lost its proper meaning and combines a number of other meanings to which it is related in just the same way as a "meaningless" word would be. This is what occurred, for instance, in the ten-year-old boy's dream of a "category" which was recorded by Tausk (1913). "Category" in that case meant "female genitals" and to "categorate" meant the same as "to micturate."

Where spoken sentences occur in dreams and are expressly distinguished as such from thoughts, it is an invariable rule that the words spoken in the dream are derived from spoken words remembered in the dream-material. The text of the speech is either retained unaltered or expressed with some slight displacement. A speech in a dream is often put together from various recollected speeches, the text remaining the same but being given, if possible, several meanings, or one different from the original one. A spoken remark in a dream is not infrequently no more than an allusion to an occasion on which the remark in question was made.

The work of displacement

In making our collection of instances of condensation in dreams, the existence of another relation, probably of no less importance, had already become evident. It could be seen that the elements which stand out as the principal components of the manifest content of the dream are far from playing the same part in the dream-thoughts. And, as a corollary, the converse of this assertion can be affirmed: what is clearly the essence of the dream-thoughts need not be represented in the dream at all. The dream is, as it were, differently centered from the dream-thoughts - its content has different elements as its central point. Thus in the dream of the botanical monograph, for instance, the central point of the dream-content was obviously the element "botanical"; whereas the dream-thoughts were concerned with the complications and conflicts arising between colleagues from their professional obligations, and further with the charge that I was in the habit of sacrificing too much for the sake of my hobbies. The element "botanical" had no place whatever in this core of the dream-thoughts, unless it was loosely connected with it by an antithesis - the fact that botany never had a place among my favorite studies. In my patient's *Sappho* dream the central position was occupied by climbing up and down and being up above and down below; the dream-thoughts, however, dealt with the dangers of sexual relations with people of an inferior social class. So that only a single element of the dream-thoughts seems to have found its way into the dream-content, though that element was expanded to a disproportionate extent. Similarly, in the dream of the may-beetles, the topic of which was the relations of sexuality to cruelty, it is true that the factor of cruelty emerged in the dream-content; but it did so in another connection and without any mention of sexuality, that is to say, divorced from its context and consequently transformed into something extraneous. Once again, in my dream about my uncle, the fair beard which formed its center-point seems to have had no connection in its meaning with my ambitious wishes which, as we saw, were the core of the dream-thoughts. Dreams such as these give a justifiable impression of

"displacement." In complete contrast to these examples, we can see that in the dream of Irma's injection the different elements were able to retain, during the process of constructing the dream, the approximate place which they occupied in the dream-thoughts. This further relation between the dream-thoughts and the dream-content, wholly variable as it is in its sense or direction, is calculated at first to create astonishment. If we are considering a psychical process in normal life and find that one out of its several component ideas has been picked out and has acquired a special degree of vividness in consciousness, we usually regard this effect as evidence that a specially high amount of psychical value - some particular degree of interest - attaches to this predominant idea. But we now discover that, in the case of the different elements of the dream-thoughts, a value of this kind does not persist or is disregarded in the process of dream-formation. There is never any doubt as to which of the elements of the dream-thoughts have the highest psychical value; we learn that by direct judgement. In the course of the formation of a dream these essential elements, charged, as they are, with intense interest, may be treated as though they were of small value, and their place may be taken in the dream by other elements, of whose small value in the dream-thoughts there can be no question. At first sight it looks as though no attention whatever is paid to the psychical intensity of the various ideas in making the choice among them for the dream, and as though the only thing considered is the greater or less degree of multiplicity of their determination. What appears in dreams, we might suppose, is not what is *important* in the dream-thoughts but what occurs in them several times over. But this hypothesis does not greatly assist our understanding of dream-formation, since from the nature of things it seems clear that the two factors of multiple determination and inherent psychical value must necessarily operate in the same sense. The ideas which are most important among the dream-thoughts will almost certainly be those which occur most often in them, since the different dream-thoughts will, as it were, radiate out from them. Nevertheless a dream can reject elements which are thus both highly stressed in themselves and reinforced from many directions, and can select for its content other elements which possess only the second of these attributes.

In order to solve this difficulty we shall make use of another impression derived from our enquiry [in the previous section] into the overdetermination of the dream-content. Perhaps some of those who have read that enquiry may already have formed an independent conclusion that the overdetermination of the elements of dreams is no very important discovery, since it is a self-evident one. For in analysis we start out from the dream-elements and note down all the associations which lead off from them; so that there is nothing surprising in the fact that in the thought-material arrived at in this way we come across these same elements with peculiar frequency. I cannot accept this objection; but I will myself put into words something that sounds not unlike it. Among the thoughts that analysis brings to light are many which are relatively remote from the kernel of the dream and which look like artificial interpolations made for some particular purpose. That purpose is easy to divine. It is precisely *they* that constitute a connection, often a forced and far-fetched one, between the dream-content and the dream-thoughts; and if these elements were weeded out of the analysis the result would often be that the component parts of the dream-content would be left not only without overdetermination but without any satisfactory determination at all. We shall be led to conclude that the multiple determination which decides what shall be included in a dream is not always a primary

factor in dream-construction but is often the secondary product of a psychical force which is still unknown to us. Nevertheless multiple determination must be of importance in choosing what particular elements shall enter a dream, since we can see that a considerable expenditure of effort is used to bring it about in cases where it does not arise from the dream-material unassisted.

It thus seems plausible to suppose that in the dream-work a psychical force is operating which on the one hand strips the elements which have a high psychical value of their intensity, and on the other hand, by *means of overdetermination*, creates from elements of low psychical value new values, which afterwards find their way into the dream-content. If that is so, a *transference and displacement of psychical intensities* occurs in the process of dream-formation, and it is as a result of these that the difference between the text of the dream-content and that of the dream-thoughts comes about. The process which we are here presuming is nothing less than the essential portion of the dream-work; and it deserves to be described as "dream-displacement." Dream-displacement and dream-condensation are the two governing factors to whose activity we may in essence ascribe the form assumed by dreams.

Nor do I think we shall have any difficulty in recognizing the psychical force which manifests itself in the facts of dream-displacement. The consequence of the displacement is that the dream-content no longer resembles the core of the dream-thoughts and that the dream gives no more than a distortion of the dream-wish which exists in the unconscious. But we are already familiar with dream-distortion. We traced it back to the censorship which is exercised by one psychical agency in the mind over another. Dream-displacement is one of the chief methods by which that distortion is achieved. *Is fecit cui profuit*. We may assume, then, that dream-displacement comes about through the influence of the same censorship - that is, the censorship of endopsychic defence.

The question of the interplay of these factors - of displacement, condensation and overdetermination - in the construction of dreams, and the question which is a dominant factor and which a subordinate one - all of this we shall leave aside for later investigation. But we can state provisionally a second condition which must be satisfied by those elements of the dream-thoughts which make their way into the dream: *they must escape the censorship imposed by resistance*. And henceforward in interpreting dreams we shall take dream-displacement into account as an undeniable fact.

Notes

- 1 The occurrence of condensation in dreams has been hinted at by many writers. Du Prel has a passage in which he says it is absolutely certain that there has been a process of condensation of the groups of ideas in dreams. (C. Du Prel, *Die Philosophie der Mystik* (Leipzig, 1885), p. 85.)
- 2 ["... a thousand threads one treadle throws, / Where fly the shuttles hither and thither, / Unseen the threads are knit together, / And an infinite combination grows." Goethe, *Faust*, Part I [Scene 4] (Bayard Taylor's translation).]
- 3 [Footnote added 1911:] What I have written below in the section on symbolism about the significance of dreams of climbing throws light upon the imagery chosen by the novelist.
- 4 [Literally: "I was lately a guest at an *inn* with a most gentle host." (Uhland, *Wanderlieder*, 8, "Einkehr.")]
- 5 ["FAUST (*dancing with the Young Witch*): A lovely dream once came to me, / And I beheld an apple-tree, / On which two lovely apples shone; / They charmed me so, I *climbed thereon*.

THE LOVELY WITCH: Apples have been desired by you./Since first in Paradise they grew; / And I am moved with joy to know / That such within my garden grow." Goethe, *Faust*, Part I [Scene 21, Walpurgisnacht] (Bayard Taylor's translation, slightly modified).]

- 6 The imaginary nature of the situation relating to the dreamer's wet-nurse was proved by the objectively established fact that in his case the wet-nurse had been his mother. I may recall in this connection the anecdote of the young man who regretted that he had not made better use of his opportunities with his wet-nurse. A regret of the same kind was no doubt the source of the present dream.
- 7 [The commoner English equivalent for the German "*Maikafer*" is "cockchafer." For the purposes of this dream, however, a literal translation is to be preferred.]
- 8 This had been the true instigator of the dream.
- 9 An interpolation is required at this point: "books of that kind are *poison* to a girl." The patient herself had dipped into forbidden books a great deal when she was young.
- 10 [Fear not, to love I'll ne'er compel thee; Yet 'tis too soon to *set thee free*. (Sarastro to Pamina in the *Finale* to Act I. - E. J. Dent's translation.)]
- 11 ["You are madly in love with me." Literally: "You are in love with me like a *beetle*."" From Kleist's *Kdchen von Heilbronn*, IV, 2.] - A further train of thought led to the same poet's *Penthesilea*, and to the idea of *cruelty* to a lover.
- 12 [Literally: "Because thou wast inspired by such *evil pleasure*."" This is presumably a recollection of the opening phrase of the Pope's condemnation reported by Tannhauser in the last scene of the opera. The actual words are: "Hast du so böse Lust getheilt" - "Since thou hast shared such evil pleasure."]
- 13 [This ingenious example of condensation turns upon the pronunciation of the second syllable - the stressed syllable - of the nonsense word. If it is "*ze*," it is pronounced roughly like the English "say," thus resembling the second syllable of "*erzählen*" and of the invented "*erzeh-lerisch*." If it is "*zi*" it is pronounced roughly like the English "tsee," thus resembling the second syllable of "'*erzieherisch*" as well as (less closely) the first syllable of "syphilis."]
- 14 [Footnote added 1909:] Not long ago I found a single exception to this rule in the case of a young man who suffered from obsessions while retaining intact his highly developed intellectual powers. The spoken words which occurred in his dreams were not derived from remarks which he had heard or made himself. They contained the undistorted text of his obsessional thoughts, which in his waking life only reached his consciousness in a modified form.
- 15 *Psychical* intensity or value or the degree of interest of an idea is of course to be distinguished from *sensory* intensity or the intensity of the image presented.
- 16 [The old legal tag: "He did the deed who gained by it."]
- 17 [Footnote added 1909:] Since I may say that the kernel of my theory of dreams lies in my derivation of dream-distortion from the censorship, I will here insert the last part of a story from *Pliant asien eines Realist en [Phantasies of a Realist]* by "Lynkeus" (Vienna, 2nd edition, 1900 [1st edition, 1899]), in which I have found this principal feature of my theory once more expounded. The title of the story is "Traumen wie Wachen" ["Dreaming like Waking"]:

"About a man who has the remarkable attribute of never dreaming nonsense ____

"This splendid gift of yours, for dreaming as though you were waking, is a consequence of your virtues, of your kindness, your sense of justice, and your love of truth; it is the moral serenity of your nature which makes me understand all about you."

"But when I think the matter over properly," replied the other, "I almost believe that everyone is made like me, and that no one at all ever dreams nonsense. Any dream which one can remember clearly enough to describe it afterwards - any dream, that is to say, which is not a fever-dream - must *always* make sense, and it cannot possibly be otherwise. For things that were mutually contradictory could not group themselves into a single whole. The fact that time and space are often thrown into confusion does not affect the true content of the dream, since no doubt neither of them are of significance for its real essence. We often do the same thing in waking life. Only think of fairy tales and of the many daring products of the imagination, which are full of meaning and of which only a man without intelligence could say: 'This is nonsense, for it's impossible.'"

"If only one always knew how to interpret dreams in the right way, as you have just done with mine!" said his friend.

"That is certainly no easy task; but with a little attention on the part of the dreamer himself it should no doubt always succeed. - You ask why it is that for the most part it does *not* succeed? In you other people there seems always to be something that lies concealed in your dreams, something unchaste in a special and higher sense, a certain secret quality in your being which it is hard to follow. And that is why your dreams so often seem to be without meaning or even to be nonsense. But in the deepest sense this is not in the least so; indeed, it cannot be so at all - for it is always the same man, whether he is awake or dreaming."

On Narcissism

Sigmund Freud

Moments in Freud's work prefigure later, post-Freudian developments in psychoanalysis. This 1914 essay, for example, discusses the "ego ideal," a mental representation that gives expression, according to Freud, to repressed narcissistic libido. Later theorists will describe similar constructs as "internalizations" or as "introjections" that are modeled on external objects such as parents. Rather than give expression to libido or instinctual drives, they will come to be seen as representations built up in the self as a way of securing for itself the benefit of relations with others that have become unstable or insecure.

Observation of normal adults shows that their former megalomania has been damped down and that the psychical characteristics from which we inferred their infantile narcissism have been effaced. What has become of their ego-libido? Are we to suppose that the whole amount of it has passed into object-cathexes? Such a possibility is plainly contrary to the whole trend of our argument; but we may find a hint at another answer to the question in the psychology of repression.

We have learnt that libidinal instinctual impulses undergo the vicissitude of pathogenic repression if they come into conflict with the subject's cultural and ethical ideas. By this we never mean that the individual in question has a merely intellectual knowledge of the existence of such ideas; we always mean that he recognizes them as a standard for himself and submits to the claims they make on him. Repression, we have said, proceeds from the ego; we might say with greater precision that it proceeds from the self-respect of the ego. The same impressions, experiences, impulses and desires that one man indulges or at least works over consciously will be rejected with the utmost indignation by another, or even stifled before they enter consciousness. The difference between the two, which contains the conditioning factor of repression, can easily be expressed in terms which enable it to be explained by the libido theory. We can say that the one man has set up an *ideal* in himself by which he measures his actual ego, while the other has formed no such ideal. For the ego the formation of an ideal would be the conditioning factor of repression.

This ideal ego is now the target of the self-love which was enjoyed in childhood by the actual ego. The subject's narcissism makes its appearance displaced on to this new ideal ego, which, like the infantile ego, finds itself possessed of every perfection that is of value. As always where the libido is concerned, man has here again shown himself incapable of giving up a satisfaction he had once enjoyed. He is not willing to forgo the narcissistic perfection of his childhood; and when, as he grows up, he is disturbed by the admonitions of others and by the awakening of his own critical judgement, so that he can no longer retain that perfection, he seeks to

recover it in the new form of an ego ideal. What he projects before him as his ideal is the substitute for the lost narcissism of his childhood in which he was his own ideal.

We are naturally led to examine the relation between this forming of an ideal and sublimation. Sublimation is a process that concerns object-libido and consists in the instinct's directing itself towards an aim other than, and remote from, that of sexual satisfaction; in this process the accent falls upon deflection from sexuality. Idealization is a process that concerns the *object*; by it that object, without any alteration in its nature, is aggrandized and exalted in the subject's mind. Idealization is possible in the sphere of ego-libido as well as in that of object-libido. For example, the sexual overvaluation of an object is an idealization of it. In so far as sublimation describes something that has to do with the instinct and idealization something to do with the object, the two concepts are to be distinguished from each other.

The formation of an ego ideal is often confused with the sublimation of instinct, to the detriment of our understanding of the facts. A man who has exchanged his narcissism for homage to a high ego ideal has not necessarily on that account succeeded in sublimating his libidinal instincts. It is true that the ego ideal demands such sublimation, but it cannot enforce it; sublimation remains a special process which may be prompted by the ideal but the execution of which is entirely independent of any such prompting. It is precisely in neurotics that we find the highest differences of potential between the development of their ego ideal and the amount of sublimation of their primitive libidinal instincts; and in general it is far harder to convince an idealist of the inexpedient location of his libido than a plain man whose pretensions have remained more moderate. Further, the formation of an ego ideal and sublimation are quite differently related to the causation of neurosis. As we have learnt, the formation of an ideal heightens the demands of the ego and is the most powerful factor favoring repression; sublimation is a way out, a way by which those demands can be met without involving repression.

It would not surprise us if we were to find a special psychical agency which performs the task of seeing that narcissistic satisfaction from the ego ideal is ensured and which, with this end in view, constantly watches the actual ego and measures it by that ideal. If such an agency does exist, we cannot possibly come upon it as a discovery, we can only recognize it; for we may reflect that what we call our "conscience" has the required characteristics. Recognition of this agency enables us to understand the so-called "delusions of being noticed" or more correctly, of being watched, which are such striking symptoms in the paranoid diseases and which may also occur as an isolated form of illness, or intercalated in a transference neurosis. Patients of this sort complain that all their thoughts are known and their actions watched and supervised; they are informed of the functioning of this agency by voices which characteristically speak to them in the third person ("Now she's thinking of that again," "now he's going out"). This complaint is justified; it describes the truth. A power of this kind, watching, discovering and criticizing all our intentions, does really exist. Indeed, it exists in every one of us in normal life.

Delusions of being watched present this power in a regressive form, thus revealing its genesis and the reason why the patient is in revolt against it. For what prompted the subject to form an ego ideal, on whose behalf his conscience acts as watchman, arose from the critical influence of his parents (conveyed to him by the medium of the voice), to whom were added, as time went on, those who trained and taught him

and the innumerable and indefinable host of all the other people in his environment - his fellow-men - and public opinion.

In this way large amounts of libido of an essentially homosexual kind are drawn into the formation of the narcissistic ego ideal and find outlet and satisfaction in maintaining it. The institution of conscience was at bottom an embodiment, first of parental criticism, and subsequently of that of society - a process which is repeated in what takes place when a tendency towards repression develops out of a prohibition or obstacle that came in the first instance from without. The voices, as well as the undefined multitude, are brought into the foreground again by the disease, and so the evolution of conscience is reproduced regressively. But the revolt against this "censoring agency" arises out of the subject's desire (in accordance with the fundamental character of his illness) to liberate himself from all these influences, beginning with the parental one, and out of his withdrawal of homosexual libido from them. His conscience then confronts him in a regressive form as a hostile influence from without.

The complaints made by paranoics also show that at bottom the self-criticism of conscience coincides with the self-observation on which it is based. Thus the activity of the mind which has taken over the function of conscience has also placed itself at the service of internal research, which furnishes philosophy with the material for its intellectual operations. This may have some bearing on the characteristic tendency of paranoics to construct speculative systems.

The Uncanny

Sigmund Freud

"The Uncanny" (1919) is one of Freud's most famous essays on literature. Critics often use the term "uncanny" in discussing things that appear to slip outside of normal perceptions or normal assumptions. For Freud, it named the effects of the unconscious that surprise us and create an effect of "uncanniness" because we are unaware of the operation of the unconscious.

The German word *unheimlich* is obviously the opposite of *Heimlich*, *heimisch*, meaning "familiar," "native," "belonging to the home"; and we are tempted to conclude that what is "uncanny" is frightening precisely because it is *not* known and familiar. Naturally not everything which is new and unfamiliar is frightening, however; the relation cannot be inverted. We can only say that what is novel can easily become frightening and uncanny; some new things are frightening but not by any means all. Something has to be added to what is novel and unfamiliar to make it uncanny.

On the whole, Jentsch did not get beyond this relation of the uncanny to the novel and unfamiliar. He ascribes the essential factor in the production of the feeling of uncanniness to intellectual uncertainty; so that the uncanny would always be that in which one does not know where one is, as it were. The better orientated in his environment a person is, the less readily will he get the impression of something uncanny in regard to the objects and events in it.

It is not difficult to see that this definition is incomplete, and we will therefore try to proceed beyond the equation of *unheimlich* with unfamiliar. We will first turn to other languages. But foreign dictionaries tell us nothing new, perhaps only because we speak a different language. Indeed, we get the impression that many languages are without a word for this particular variety of what is fearful.

I wish to express my indebtedness to Dr Th. Reik for the following excerpts:

LATIN: (K. E. Georges, *Deutschlateinisch.es Worterbuch*, 1898). Ein *unheimlicher* Ort [an uncanny place] - locus suspectus; in *unheimlicher* Nachtzeit [in the dismal night hours] - intempesta nocte.

GREEK: (Rost's and Schenk's Lexikons). Evos - strange, foreign.

ENGLISH: (from dictionaries by Lucas, Bellow, Flugel, Muret: Sanders). Uncomfortable, uneasy, gloomy, dismal, uncanny, ghastly; (of a house) haunted; (of a man) a repulsive fellow.

FRENCH: (Sachs-Villatte). Inquietant, sinistre, lugubre, mal a son aise.

SPANISH: (Tollhausen, 1889). Sospechoso, de mal aguero, lugubre, siniestro.

The Italian and the Portuguese seem to content themselves with words which we should describe as circumlocutions. In Arabic and Hebrew "uncanny" means the same as "daemonic," "gruesome."

Let us therefore return to the German language. In Daniel Sanders' *Wörterbuch der deutschen Sprache* (1860), the following remarks [abstracted in translation] are found upon the word *heimlich*, I have laid stress on certain passages by italicizing them.

Heimlich adj.: 1. Also *heimelich*, *heimelig*, belonging to the house, not strange, familiar, tame, intimate, comfortable, homely, etc.

(a) (Obsolete) belonging to the house or the family, or regarded as so belonging (cf. Latin *familiaris*): *Die Heimlichen*, the members of the household; *Der heimliche Rat* [him to whom secrets are revealed] Gen. xli. 45; 2 Sam. xxiii. 23; now more usually *Geheimer Rat* [Privy Councillor], cf. *Heimlicher*.

(b) Of animals: tame, companionable to man. As opposed to wild, e.g. "Wild animals ... that are trained to be *heimlich* and accustomed to men." "If these young creatures are brought up from early days among men they become quite *heimlich*, friendly," etc.

(c) Friendly, intimate, homelike; the enjoyment of quiet content, etc., arousing a sense of peaceful pleasure and security as in one within the four walls of his house. "Is it still *heimlich* to you in your country where strangers are felling your woods?" "She did not feel all too *heimlich* with him." "To destroy the *Heimlichkeit* of the home." "I could not readily find another spot so intimate and *heimlich* as this." "In quiet *Heimlichkeit*, surrounded by close walls." "A careful housewife, who knows how to make a pleasing *Heimlichkeit* (*Hauslichkeit*) out of the smallest means." "The protestant rulers do not feel... *heimlich* among their catholic subjects." "When it grows *heimlich* and still, and the evening quiet alone watches over your cell." "Quiet, lovely and *heimlich*, no place more fitted for her rest." "The in and outflowing waves of the current, dreamy and *heimlich* as a cradle-song." Cf. in especial *Unheimlich*. Among Swabian and Swiss authors in especial, often as a trisyllable: "How *heimelich* it seemed again of an evening, back at home." "The warm room and the *heimelig* afternoon." "Little by little they grew at ease and *heimelig* among themselves." "That which comes from afar... assuredly does not live quite *heimelig* (*heimatlich* [at home], *freundnachbar-lich* [in a neighborly way]) among the people." "The sentinel's horn sounds so *heimelig* from the tower, and his voice invites so hospitably." *This form of the word ought to become general in order to protect the word from becoming obsolete in its good sense through an easy confusion with II.* [see below]. "*The Zecks* [a family name] are all '*heimlich*'." " '*Heimlich*'? What do you understand by '*heimlich*'?" "Well,... they are like a buried spring or a dried-up pond. One cannot walk over it without always having the feeling that water might come up there again." "Oh, we call it '*unheimlich*'; you call it '*heimlich*.' Well, what makes you think that there is something secret and untrustworthy about this family?" Gutzkow.

II. Concealed, kept from sight, so that others do not get to know about it, withheld from others, cf. *geheim* [secret]; so also *Heimlichkeit* for *Geheimnis* [secret]. To do something *heimlich*, i.e. behind someone's back; to steal away *heimlich*; *heimlich* meetings and appointments; to look on with *heimlich* pleasure at someone's discomfiture; to sigh or weep *heimlich*; to behave *heimlich*, as though there was something to conceal; *heimlich* love, love-affair, sin; *heimlich* places (which good manners oblige us to conceal). I. Sam. v. 6; "The *heimlich* chamber" [privy]. 2. Kings x. 27 etc.; "To throw into pits or *Heimlichkeit*." Led the steeds *heimlich* before Laomedon." "As secretive, *heimlich*, deceitful and malicious towards cruel masters... as frank, open, sympathetic and helpful towards a friend in misfortune." "The *heimlich* art" (magic). "Where public ventilation

has to stop, there *heimlich* machinations begin." "Freedom is the whispered watchword of *heimlich* conspirators and the loud battle-cry of professed revolutionaries." "A holy, *heimlich* effect." "I have roots that are most *heimlich*, I am grown in the deep earth." "My *heimlich* pranks." (Cf. *Heimtiicke* [mischief]). To discover, disclose, betray someone's *Heimlichkeiten*; to concoct *Heimlichkeiten* behind my back." Cf. *Geheimnis*.

Compounds and especially also the opposite follow meaning I. (above): *Unheimlich*, uneasy, eerie, blood-curdling; "Seeming almost *unheimlich* and ghostly to him." "I had already long since felt an *unheimlich*, even gruesome feeling." "Feels an *unheimlich* horror." "*Unheimlich* and motionless like a stone-image." "The *unheimlich* mist called hill-fog." "These pale youths are *unheimlich* and are brewing heaven knows what mischief." " '*Unheimlich* is the name for everything that ought to have remained... hidden and secret and has become visible.' " Schelling. "To veil the divine to surround it with a certain *Unheimlichkeit*.'" - *Unheimlich* is not often used as opposite to meaning II. (above).

What interests us most in this long extract is to find that among its different shades of meaning the word *heimlich* exhibits one which is identical with its opposite, *unheimlich*. What is *heimlich* thus comes to be *unheimlich*. (Cf. the quotation from Gutzkow: "We call it *unheimlich*; you call it *heimlich*.'"') In general we are reminded that the word *heimlich* is not unambiguous, but belongs to two sets of ideas, which without being contradictory are yet very different: on the one hand, it means that which is familiar and congenial, and on the other, that which is concealed and kept out of sight. "*Unheimlich*" is customarily used, we are told, as the contrary only of the first signification of "*heimlich*" and not of the second. Sanders tells us nothing concerning a possible genetic connection between these two meanings of *heimlich*. On the other hand, we notice that Schelling says something which throws quite a new light on the concept of the *Unheimlich*, for which we were certainly not prepared. According to him, everything is *unheimlich* that ought to have remained secret and hidden but has come to light.

Some of the doubts that have thus arisen are removed if we consult Grimm's dictionary (1877, 4, Part 2, pp. 873 ff.)

We read:

Heimlich; adj. and adv. *vernaculus, occultus*; MHG. heimelich, heimlich.

(p. 874.) In a slightly different sense: "I feel *heimlich*, well, free from fear." ...

[3] (b) Heimlich is also used of a place free from ghostly influences... familiar, friendly, intimate.

(p. 875: p) Familiar, amicable, unreserved.

4. From the idea of "homelike," "belonging to the house," the further idea is developed of something withdrawn from the eyes of strangers, something concealed, secret; and this idea is expanded in many ways...

(p. 876.) "On the left bank of the lake there lies a meadow *heimlich* in the wood." (Schiller, *Wilhelm Tell*, I, 4.)... Poetic licence, rarely so used in modern speech... *Heimlich* is used in conjunction with a verb expressing the act of concealing: "In the secret of his tabernacle he shall hide me *heimlich*" (Ps. xxvii. 5.)... *Heimlich* parts of the human body, *pudenda*... "the men that died not were smitten on their *heimlich* parts." (1 Samuel v. 12.)...

(c) Officials who give important advice which has to be kept secret in matters of state are called *heimlich* councillors; the adjective, according to modern usage, has been replaced by *geheim* [secret]... "Pharaoh called Joseph's name 'him to whom secrets are revealed'" (*heimlich* councillor). (Gen. xli. 45.)

(p. 878.) 6. *Heimlich*, as used of knowledge — mystic, allegorical: a *heimlich* meaning, *mysticus, divinus, occultus, figuratus*. (p. 878.) *Heimlich* in a different sense, as withdrawn from knowledge, unconscious... *Heimlich* also has the meaning of that which is obscure, inaccessible to knowledge... "Do you not see? They do not trust us; they fear the *heimlich* face of the Duke of Friedland." (Schiller, *Wallensteins Lager*, Scene 2.)

9. *The notion of something hidden and dangerous, which is expressed in the last paragraph, is still further developed, so that "heimlich" comes to have the meaning usually ascribed to "unheimlich."* Thus: "At times I feel like a man who walks in the night and believes in ghosts; every corner is *heimlich* and full of terrors for him." (Klinger, *Theater*, 3. 298.)

Thus *heimlich* is a word the meaning of which develops in the direction of ambivalence, until it finally coincides with its opposite, *unheimlich*. *Unheimlich* is in some way or other a sub-species of *heimlich*. Let us bear this discovery in mind, though we cannot yet rightly understand it, alongside of Schelling's definition of the *Unheimlich*. If we go on to examine individual instances of uncanniness, these hints will become intelligible to us.

II

When we proceed to review the things, persons, impressions, events and situations which are able to arouse in us a feeling of the uncanny in a particularly forcible and definite form, the first requirement is obviously to select a suitable example to start on. Jentsch has taken as a very good instance "doubts whether an apparently animate being is really alive; or conversely, whether a lifeless object might not be in fact animate"; and he refers in this connection to the impression made by waxwork figures, ingeniously constructed dolls and automata. To these he adds the uncanny effect of epileptic fits, and of manifestations of insanity, because these excite in the spectator the impression of automatic, mechanical processes at work behind the ordinary appearance of mental activity. Without entirely accepting this author's view, we will take it as a starting-point for our own investigation because in what follows he reminds us of a writer who has succeeded in producing uncanny effects better than anyone else.

Jentsch writes: "In telling a story, one of the most successful devices for easily creating uncanny effects is to leave the reader in uncertainty whether a particular figure in the story is a human being or an automaton, and to do it in such a way that his attention is not focused directly upon his uncertainty, so that he may not be led to go into the matter and clear it up immediately. That, as we have said, would quickly dissipate the peculiar emotional effect of the thing. E. T. A. Hoffmann has repeatedly employed this psychological artifice with success in his fantastic narratives."

This observation, undoubtedly a correct one, refers primarily to the story of "The Sand-Man" in Hoffmann's *Nachtstiicken*, which contains the original of Olympia, the doll that appears in the first act of Offenbach's opera, *Tales of Hoffmann*. But I cannot think - and I hope most readers of the story will agree with me - that the theme of the doll Olympia, who is to all appearances a living being, is by any means the only, or indeed the most important, element that must be held responsible for the quite unparalleled atmosphere of uncanniness evoked by the story. Nor is this

atmosphere heightened by the fact that the author himself treats the episode of Olympia with a faint touch of satire and uses it to poke fun at the young man's idealization of his mistress. The main theme of the story is, on the contrary, something different, something which gives it its name, and which is always re-introduced at critical moments: it is the theme of the "Sand-Man" who tears out children's eyes.

This fantastic tale opens with the childhood recollections of the student Nathaniel. In spite of his present happiness, he cannot banish the memories associated with the mysterious and terrifying death of his beloved father. On certain evenings his mother used to send the children to bed early, warning them that "the Sand-Man was coming"; and, sure enough, Nathaniel would not fail to hear the heavy tread of a visitor, with whom his father would then be occupied for the evening. When questioned about the Sand-Man, his mother, it is true, denied that such a person existed except as a figure of speech; but his nurse could give him more definite information: "He's a wicked man who comes when children won't go to bed, and throws handfuls of sand in their eyes so that they jump out of their heads all bleeding. Then he puts the eyes in a sack and carries them off to the half-moon to feed his children. They sit up there in their nest, and their beaks are hooked like owls' beaks, and they use them to peck up naughty boys' and girls' eyes with."

Although little Nathaniel was sensible and old enough not to credit the figure of the Sand-Man with such gruesome attributes, yet the dread of him became fixed in his heart. He determined to find out what the Sand-Man looked like; and one evening, when the Sand-Man was expected again, he hid in his father's study. He recognized the visitor as the lawyer Coppelius, a repulsive person whom the children were frightened of when he occasionally came to a meal; and he now identified this Coppelius with the dreaded Sand-Man. As regards the rest of the scene, Hoffmann already leaves us in doubt whether what we are witnessing is the first delirium of the panic-stricken boy, or a succession of events which are to be regarded in the story as being real. His father and the guest are at work at a brazier with glowing flames. The little eavesdropper hears Coppelius call out: "Eyes here! Eyes here!" and betrays himself by screaming aloud. Coppelius seizes him and is on the point of dropping bits of red-hot coal from the fire into his eyes, and then of throwing them into the brazier, but his father begs him off and saves his eyes. After this the boy falls into a deep swoon; and a long illness brings his experience to an end. Those who decide in favour of the rationalistic interpretation of the Sand-Man will not fail to recognize in the child's phantasy the persisting influence of his nurse's story. The bits of sand that are to be thrown into the child's eyes turn into bits of red-hot coal from the flames; and in both cases they are intended to make his eyes jump out. In the course of another visit of the Sand-Man's, a year later, his father is killed in his study by an explosion. The lawyer Coppelius disappears from the place without leaving a trace behind.

Nathaniel, now a student, believes that he has recognized this phantom of horror from his childhood in an itinerant optician, an Italian called Giuseppe Coppola, who at his university town, offers him weather-glasses for sale. When Nathaniel refuses, the man goes on: "Not weather-glasses? not weather-glasses? also got fine eyes, fine eyes!" The student's terror is allayed when he finds that the proffered eyes are only harmless spectacles, and he buys a pocket spy-glass from Coppola. With its aid he looks across into Professor Spalanzani's house opposite and there spies Spalanzani's beautiful, but strangely silent and motionless daughter, Olympia. He soon falls in love

with her so violently that, because of her, he quite forgets the clever and sensible girl to whom he is betrothed. But Olympia is an automaton whose clockwork has been made by Spalanzani, and whose eyes have been put in by Coppola, the Sand-Man. The student surprises the two Masters quarrelling over their handiwork. The optician carries off the wooden eyeless doll; and the mechanic, Spalanzani, picks up Olympia's bleeding eyes from the ground and throws them at Nathaniel's breast, saying that Coppola had stolen them from the student. Nathaniel succumbs to a fresh attack of madness, and in his delirium his recollection of his father's death is mingled with this new experience. "Hurry up! hurry up! ring of fire!" he cries. "Spin about, ring of fire - Hurrah! Hurry up, wooden doll! lovely wooden doll, spin about -." He then falls upon the professor, Olympia's "father," and tries to strangle him.

Rallying from a long and serious illness, Nathaniel seems at last to have recovered. He intends to marry his betrothed, with whom he has become reconciled. One day he and she are walking through the city market-place, over which the high tower of the Town Hall throws its huge shadow. On the girl's suggestion, they climb the tower, leaving her brother, who is walking with them, down below. From the top, Clara's attention is drawn to a curious object moving along the street. Nathaniel looks at this thing through Coppola's spy-glass, which he finds in his pocket, and falls into a new attack of madness. Shouting "spin about, wooden doll!" he tries to throw the girl into the gulf below. Her brother, brought to her side by her cries, rescues her and hastens down with her to safety. On the tower above, the madman rushes round, shrieking "Ring of fire, spin about!" - and we know the origin of the words. Among the people who begin to gather below there comes forward the figure of the lawyer Coppelius, who has suddenly returned. We may suppose that it was his approach, seen through the spy-glass, which threw Nathaniel into his fit of madness. As the onlookers prepare to go up and overpower the madman, Coppelius laughs and says: "Wait a bit; he'll come down of himself." Nathaniel suddenly stands still, catches sight of Coppelius, and with a wild shriek "Yes! 'Fine eyes - fine eyes!'" flings himself over the parapet. While he lies on the paving-stones with a shattered skull the Sand-Man vanishes in the throng.

This short summary leaves no doubt, I think, that the feeling of something uncanny is directly attached to the figure of the Sand-Man, that is, to the idea of being robbed of one's eyes, and that Jentsch's point of an intellectual uncertainty has nothing to do with the effect. Uncertainty whether an object is living or inanimate, which admittedly applied to the doll Olympia, is quite irrelevant in connection with this other, more striking instance of uncanniness. It is true that the writer creates a kind of uncertainty in us in the beginning by not letting us know, no doubt purposely, whether he is taking us into the real world or into a purely fantastic one of his own creation. He has, of course, a right to do either; and if he chooses to stage his action in a world peopled with spirits, demons and ghosts, as Shakespeare does in *Hamlet*, in *Macbeth* and, in a different sense, in *The Tempest* and *A Midsummer Night's Dream*, we must bow to his decision and treat his setting as though it were real for as long as we put ourselves into his hands. But this uncertainty disappears in the course of Hoffmann's story, and we perceive that he intends to make us, too, look through the demon optician's spectacles or spy-glass - perhaps, indeed, that the author in his very own person once peered through such an instrument. For the conclusion of the story makes it quite clear that Coppola the optician really *is* the lawyer Coppelius⁴ and also, therefore, the Sand-Man.

There is no question therefore, of any intellectual uncertainty here: we know now that we are not supposed to be looking on at the products of a madman's imagination, behind which we, with the superiority of rational minds, are able to detect the sober truth; and yet this knowledge does not lessen the impression of uncanniness in the least degree. The theory of intellectual uncertainty is thus incapable of explaining that impression.

We know from psycho-analytic experience, however, that the fear of damaging or losing one's eyes is a terrible one in children. Many adults retain their apprehensiveness in this respect, and no physical injury is so much dreaded by them as an injury to the eye. We are accustomed to say, too, that we will treasure a thing as the apple of our eye. A study of dreams, phantasies and myths has taught us that anxiety about one's eyes, the fear of going blind, is often enough a substitute for the dread of being castrated. The self-blinding of the mythical criminal, Oedipus, was simply a mitigated form of the punishment of castration - the only punishment that was adequate for him by the *lex talionis*. We may try on rationalistic grounds to deny that fears about the eye are derived from the fear of castration, and may argue that it is very natural that so precious an organ as the eye should be guarded by a proportionate dread. Indeed, we might go further and say that the fear of castration itself contains no other significance and no deeper secret than a justifiable dread of this rational kind. But this view does not account adequately for the substitutive relation between the eye and the male organ which is seen to exist in dreams and myths and phantasies; nor can it dispel the impression that the threat of being castrated in especial excites a peculiarly violent and obscure emotion, and that this emotion is what first gives the idea of losing other organs its intense colouring. All further doubts are removed when we learn the details of their "castration complex" from the analysis of neurotic patients, and realize its immense importance in their mental life.

Moreover, I would not recommend any opponent of the psycho-analytic view to select this particular story of the Sand-Man with which to support his argument that anxiety about the eyes has nothing to do with the castration complex. For why does Hoffmann bring the anxiety about eyes into such intimate connection with the father's death? And why does the Sand-Man always appear as a disturber of love? He separates the unfortunate Nathaniel from his betrothed and from her brother, his best friend; he destroys the second object of his love, Olympia, the lovely doll; and he drives him into suicide at the moment when he has won back his Clara and is about to be happily united to her. Elements in the story like these, and many others, seem arbitrary and meaningless so long as we deny all connection between fears about the eye and castration; but they become intelligible as soon as we replace the Sand-Man by the dreaded father at whose hands castration is expected.

We shall venture, therefore, to refer the uncanny effect of the Sand-Man to the anxiety belonging to the castration complex of childhood. But having reached the idea that we can make an infantile factor such as this responsible for feelings of uncanniness, we are encouraged to see whether we can apply it to other instances of the uncanny. We find in the story of the Sand-Man the other theme on which Jentsch lays stress, of a doll which appears to be alive. Jentsch believes that a particularly favourable condition for awakening uncanny feelings is created when there is intellectual uncertainty whether an object is alive or not, and when an inanimate object becomes too much like an animate one. Now, dolls are of course

rather closely connected with childhood life. We remember that in their early games children do not distinguish at all sharply between living and inanimate objects, and that they are especially fond of treating their dolls like live people. In fact, I have occasionally heard a woman patient declare that even at the age of eight she had still been convinced that her dolls would be certain to come to life if she were to look at them in a particular, extremely concentrated, way. So that here, too, it is not difficult to discover a factor from childhood. But, curiously enough, while the Sand-Man story deals with the arousing of an early childhood fear, the idea of a "living doll" excites no fear at all; children have no fear of their dolls coming to life, they may even desire it. The source of uncanny feelings would not, therefore, be an infantile fear in this case, but rather an infantile wish or even merely an infantile belief. There seems to be a contradiction here; but perhaps it is only a complication, which may be helpful to us later on.

Hoffmann is in literature the unrivalled master of conjuring up the uncanny. His *Elixire des Teufels* [The Devil's Elixir] contains a mass of themes to which one is tempted to ascribe the uncanny effect of the narrative; but it is too obscure and intricate a story to venture to summarize. Towards the end of the book the reader is told the facts, hitherto concealed from him, from which the action springs; with the result, not that he is at last enlightened, but that he falls into a state of complete bewilderment. The author has piled up too much of a kind; one's comprehension of the whole suffers as a result, though not the impression it makes. We must content ourselves with selecting those themes of uncanniness which are most prominent, and seeing whether we can fairly trace them also back to infantile sources. These themes are all concerned with the idea of a "double" in every shape and degree, with persons, therefore, who are to be considered identical by reason of looking alike; Hoffmann accentuates this relation by transferring mental processes from the one person to the other - what we should call telepathy - so that the one possesses knowledge, feeling and experience in common with the other, identifies himself with another person, so that his self becomes confounded, or the foreign self is substituted for his own - in other words, by doubling, dividing and interchanging the self. And finally there is the constant recurrence of similar situations, a same face, or character-trait, or twist of fortune, or a same crime, or even a same name recurring throughout several consecutive generations.

The theme of the "double" has been very thoroughly treated by Otto Rank. He has gone into the connections the "double" has with reflections in mirrors, with shadows, guardian spirits, with the belief in the soul and the fear of death; but he also lets in a flood of light on the astonishing evolution of this idea. For the "double" was originally an insurance against destruction to the ego, an "energetic denial of the power of death," as Rank says; and probably the "Immortal" soul was the first "double" of the body. This invention of doubling as a preservation against extinction has its counterpart in the language of dreams, which is fond of representing castration by a doubling or multiplication of the genital symbol; the same desire spurred on the ancient Egyptians to the art of making images of the dead in some lasting material. Such ideas, however, have sprung from the soil of unbounded self-love, from the primary narcissism which holds sway in the mind of the child as in that of primitive man; and when this stage has been left behind the double takes on a different aspect. From having been an assurance of immortality, he becomes the ghastly harbinger of death.

The idea of the "double" does not necessarily disappear with the passing of the primary narcissism, for it can receive fresh meaning from the later stages of development of the ego. A special faculty is slowly formed there, able to oppose the rest of the ego, with the function of observing and criticizing the self and exercising a censorship within the mind, and this we become aware of as our "conscience." In the pathological case of delusions of being watched this mental institution becomes isolated, dissociated from the ego, and discernible to a physician's eye. The fact that a faculty of this kind exists, which is able to treat the rest of the ego like an object - the fact, that is, that man is capable of self-observation - renders it possible to invest the old idea of a "double" with a new meaning and to ascribe many things to it, above all, those things which seem to the new faculty of self-criticism to belong to the old surmounted narcissism of the earliest period of all.

But it is not only this narcissism, offensive to the ego-criticizing faculty, which may be incorporated in the idea of a double. There are also all those unfulfilled but possible futures to which we still like to cling in phantasy, all those strivings of the ego which adverse external circumstances have crushed, and all our suppressed acts of volition which nourish in us the illusion of Free Will.

But, after having thus considered the manifest motivation of the figure of a "double," we have to admit that none of it helps us to understand the extraordinarily strong feeling of something uncanny that pervades the conception; and our knowledge of pathological mental processes enables us to add that nothing in the content arrived at could account for that impulse towards self-protection which has caused the ego to project such a content outward as something foreign to itself. The quality of uncanniness can only come from the circumstance of the "double" being a creation dating back to a very early mental stage - long since left behind, and one, no doubt, in which it wore a more friendly aspect. The "double" has become a vision of terror, just as after the fall of their religion the gods took on daemonic shapes.

It is not difficult to judge, on the same lines as his theme of the "double," the other forms of disturbance in the ego made use of by Hoffmann. They are a harking-back to particular phases in the evolution of the self-regarding feeling, a regression to a time when the ego was not yet sharply differentiated from the external world and from other persons. I believe that these factors are partly responsible for the impression of the uncanny, although it is not easy to isolate and determine exactly their share of it.

That factor which consists in a recurrence of the same situations, things and events, will perhaps not appeal to everyone as a source of uncanny feeling. From what I have observed, this phenomenon does undoubtedly, subject to certain conditions and combined with certain circumstances, awaken an uncanny feeling, which recalls that sense of helplessness sometimes experienced in dreams. Once, as I was walking through the deserted streets of a provincial town in Italy which was strange to me, on a hot summer afternoon, I found myself in a quarter the character of which could not long remain in doubt. Nothing but painted women were to be seen at the windows of the small houses, and I hastened to leave the narrow street at the next turning. But after having wandered about for a while without being directed, I suddenly found myself back in the same street, where my presence was now beginning to excite attention. I hurried away once more, but only to arrive yet a third time by devious paths in the same place. Now, however, a feeling overcame me

which I can only describe as uncanny, and I was glad enough to abandon my exploratory walk and get straight back to the piazza I had left a short while before. Other situations having in common with my adventure an involuntary return to the same situation, but which differ radically from it in other respects, also result in the same feeling of helplessness and of something uncanny. As, for instance, when one is lost in a forest in high altitudes, caught, we will suppose, by the mountain mist, and when every endeavour to find the marked or familiar path ends again and again in a return to one and the same spot, recognizable by some particular landmark. Or when one wanders about in a dark, strange room looking for the door or the electric switch, and collides for the hundredth time with the same piece of furniture - a situation which, indeed, has been made irresistibly comic by Mark Twain, through the wild extravagance of his narration.

Taking another class of things, it is easy to see that here, too, it is only this factor of involuntary repetition which surrounds with an uncanny atmosphere what would otherwise be innocent enough, and forces upon us the idea of something fateful and unescapable where otherwise we should have spoken of "chance" only. For instance, we of course attach no importance to the event when we give up a coat and get a cloakroom ticket with the number, say, 62; or when we find that our cabin on board ship is numbered 62. But the impression is altered if two such events, each in itself indifferent, happen close together, if we come across the number 62 several times in a single day, or if we begin to notice that everything which has a number - addresses, hotel-rooms, compartments in railway-trains - always has the same one, or one which at least contains the same figures.

We do feel this to be "uncanny," and unless a man is utterly hardened and proof against the lure of superstition he will be tempted to ascribe a secret meaning to this obstinate recurrence of a number, taking it, perhaps, as an indication of the span of life allotted to him. Or take the case that one is engaged at the time in reading the works of Hering, the famous physiologist, and then receives within the space of a few days two letters from two different countries, each from a person called Hering; whereas one has never before had any dealings with anyone of that name. Not long ago an ingenious scientist attempted to reduce coincidences of this kind to certain laws, and so deprive them of their uncanny effect. I will not venture to decide whether he has succeeded or not.

How exactly we can trace back the uncanny effect of such recurrent similarities to infantile psychology is a question I can only lightly touch upon in these pages; and I must refer the reader instead to another pamphlet now ready for publication, in which this has been gone into in detail, but in a different connection. It must be explained that we are able to postulate the principle of a repetition-compulsion in the unconscious mind, based upon instinctual activity and probably inherent in the very nature of the instincts - a principle powerful enough to overrule the pleasure principle, lending to certain aspects of the mind their daemonic character, and still very clearly expressed in the tendencies of small children; a principle, too, which is responsible for a part of the course taken by the analyses of neurotic patients. Taken in all, the foregoing prepares us for the discovery that whatever reminds us of this inner *repetition-compulsion* is perceived as uncanny.

Now, however, it is time to turn from these aspects of the matter, which are in any case difficult to decide upon, and look for undeniable instances of the uncanny, in the hope that analysis of them will settle whether our hypothesis is a valid one.

In the story of "The Ring of Polycrates," the guest turns away from his friend with horror because he sees that his every wish is at once fulfilled, his every care immediately removed by kindly fate. His host has become "uncanny" to him. His own explanation, that the too fortunate man has to fear the envy of the gods, seems still rather obscure to us; its meaning is veiled in mythological language. We will therefore turn to another example in a less grandiose setting. In the case history of an obsessional neurotic, I have described how the patient once stayed in a hydropathic establishment and benefited greatly by it. He had the good sense, however, to attribute his improvement not to the therapeutic properties of the water, but to the situation of his room, which immediately adjoined that of a very amiable nurse. So on his second visit to the establishment he asked for the same room but was told that it was already occupied by an old gentleman, whereupon he gave vent to his annoyance in the words, "Well, I hope he'll have a stroke and die." A fortnight later the old gentleman really did have a stroke. My patient thought this an "uncanny" experience. And that impression of uncanniness would have been stronger still if less time had elapsed between his exclamation and the untoward event, or if he had been able to produce innumerable similar coincidences. As a matter of fact, he had no difficulty in producing coincidences of this sort, but then not only he but all obsessional neurotics I have observed are able to relate analogous experiences. They are never surprised when they invariably run up against the person they have just been thinking of, perhaps for the first time for many months. If they say one day "I haven't had news of so-and-so for a long time," they will be sure to get a letter from him the next morning. And an accident or a death will rarely take place without having cast its shadow before on their minds. They are in the habit of mentioning this state of affairs in the most modest manner, saying that they have "presentiments" which "usually" come true.

One of the most uncanny and wide-spread forms of superstition is the dread of the evil eye. There never seems to have been any doubt about the source of this dread. Whoever possesses something at once valuable and fragile is afraid of the envy of others, in that he projects on to them the envy he would have felt in their place. A feeling like this betrays itself in a look even though it is not put into words; and when a man attracts the attention of others by noticeable, and particularly by unattractive, attributes, they are ready to believe that his envy is rising to more than usual heights and that this intensity in it will convert it into effective action. What is feared is thus a secret intention of harming someone, and certain signs are taken to mean that such an intention is capable of becoming an act.

These last examples of the uncanny are to be referred to that principle in the mind which I have called "omnipotence of thoughts," taking the name from an expression used by one of my patients. And now we find ourselves on well-known ground. Our analysis of instances of the uncanny has led us back to the old, animistic conception of the universe which was characterized by the idea that the world was peopled with the spirits of humane narcissistic overestimation of subjective mental processes (such as the belief in the omnipotence of thoughts, the magical practices based upon this belief, the carefully proportioned distribution of magical powers or "mana" among various outside persons and things), as well as by all those other figments of the imagination with which man, in the unrestricted narcissism of that stage of development, strove to withstand the inexorable laws of reality. It would seem as though each one of us has been through a phase of individ-

ual development corresponding to that animistic stage in primitive men, that none of us has traversed it without preserving certain traces of it which can be reactivated and that everything which now strikes us as "uncanny" fulfills the condition of stirring these vestiges of animistic mental activity within us and bringing them to expression.

At this point I will put forward two considerations which, I think, contain the gist of this short study. In the first place, if psycho-analytic theory is correct in maintaining that every emotional affect, whatever its quality, is transformed by repression into morbid anxiety, then among such cases of anxiety there must be a class in which the anxiety can be shown to come from something repressed which *recurs*. This class of morbid anxiety would then be no other than what is uncanny, irrespective of whether it originally aroused dread or some other affect. In the second place, if this is indeed the secret nature of the uncanny, we can understand why the usage of speech has extended *das Heimliche* into its opposite *das Unheimliche*;¹⁵ for this uncanny is in reality nothing new or foreign, but something familiar and old - established in the mind that has been estranged only by the process of repression. This reference to the factor of repression enables us, furthermore, to understand Schelling's definition of the uncanny as something which ought to have been kept concealed but which has nevertheless come to light.

Notes

- 1 [Throughout this paper "uncanny" is used as the English translation of "*unheimlich*," literally "unhomely." — Trans.]
- 2 [From *Haus* = house; *Heimlichkeit* = domestic life. - Trans.]
- 3 Hoffmann's *Samtliche Werke*, Grisebach Edition, 3. [A translation of "The Sand-Man" is included in *Eight Tales of Hoffmann*, translated by J. M. Cohen (London: Pan Books, 1952).]
- 4 Frau Dr Rank has pointed out the association of the name with "*coppella*" = crucible, connecting it with the chemical operations that caused the father's death; and also with "«\$/>o" = eye-socket. [Except in the first (1919) edition this footnote was attached, it seems erroneously, to the first occurrence of the name Coppelius on this page.]
- 5 In fact, Hoffmann's imaginative treatment of his material has not made such wild confusion of its elements that we cannot reconstruct their original arrangement. In the story of Nathaniel's childhood, the figures of his father and Coppelius represent the two opposites into which the father-imago is split by his ambivalence; whereas the one threatens to blind him - that is, to castrate him - the other, the "good" father, intercedes for his sight. The part of the complex which is most strongly repressed, the death-wish against the "bad" father, finds expression in the death of the "good" father, and Coppelius is made answerable for it. This pair of fathers is represented later, in his student days, by Professor Spalanzani and Coppola the optician. The Professor is in himself a member of the father-series, and Coppola is recognized as identical with Coppelius the lawyer. Just as they used before to work together over the secret brazier, so now they have jointly created the doll Olympia; the Professor is even called the father of Olympia. This double occurrence of activity in common betrays them as divisions of the father-imago: both the mechanician and the optician were the father of Nathaniel (and of Olympia as well). In the frightening scene in childhood, Coppelius, after sparing Nathaniel's eyes, had screwed off his arms and legs as an experiment; that is, he had worked on him as a mechanician would on a doll. This singular feature, which seems quite outside the picture of the Sand-Man, introduces a new castration equivalent; but it also points to the inner identity of Coppelius with his later counterpart, Spalanzani the mechanician, and prepares us for the interpretation of Olympia. This automatic doll can be nothing else than a materialization of Nathaniel's feminine

attitude towards his father in his infancy. Her fathers, Spalanzani and Coppola, are, after all, nothing but new editions, reincarnations of Nathaniel's pair of fathers. Spalanzani's otherwise incomprehensible statement that the optician has stolen Nathaniel's eyes... so as to set them in the doll, now becomes significant as supplying evidence of the identity of Olympia and Nathaniel. Olympia is, as it were, a dissociated complex of Nathaniel's which confronts him as a person, and Nathaniel's enslavement to this complex is expressed in his senseless obsessive love for Olympia. We may with justice call love of this kind narcissistic, and we can understand why someone who has fallen victim to it should relinquish the real, external object of his love. The psychological truth of the situation in which the young man, fixated upon his father by his castration complex, becomes incapable of loving a woman, is amply proved by numerous analyses of patients whose story, though less fantastic, is hardly less tragic than that of the student Nathaniel.

Hoffmann was the child of an unhappy marriage. When he was three years old, his father left his small family, and was never united to them again. According to Grisebach, in his biographical introduction to Hoffmann's works, the writer's relation to his father was always a most sensitive subject with him.

- 6 "Der Doppelgänger."
- 7 I cannot help thinking that when poets complain that two souls dwell within the human breast, and when popular psychologists talk of the splitting of the ego in an individual, they have some notion of this division (which relates to the sphere of ego-psychology) between the critical faculty and the rest of the ego, and not of the antithesis discovered by psycho-analysis between the ego and what is unconscious and repressed. It is true that the distinction is to some extent effaced by the circumstance that derivatives of what is repressed are foremost among the things reprehended by the ego-criticizing.
- 8 In Ewers' *Der Student von Prag*, which furnishes the starting-point of Rank's study on the "double," the hero has promised his beloved not to kill his antagonist in a duel. But on his way to the dueling-ground he meets his "double," who has already killed his rival.

Beyond the Pleasure Principle

Sigmund Freud

Written in 1920, Freud's *Beyond the Pleasure Principle* was his attempt to come to terms with his realization that more seemed at work in the mind and in human life than a drive for pleasure. In this book he describes two major drives, one toward the building up of libidinal cathexes or attachments and the raising of excitation, the other toward their diminution and ultimate extinction. In this less speculative section, he discusses an example of an important principle he felt he had discovered in human life, and that is the tendency to repeat experiences or to engage in repetitive behavior. The "death drive," as he called it, seeks to repeat the earliest, pre-life experience of quiescence. But in a more mundane way, we all repeat things or seek to repeat them. In the example Freud elucidates here, he explains one kind of repetitive behavior as an attempt to deal with traumatic experiences of loss.

The different theories of children's play have only recently been summarized and discussed from the psycho-analytic point of view by Pfeifer (1919), to whose paper I would refer my readers. These theories attempt to discover the motives which lead children to play, but they fail to bring into the foreground the *economic motive*, the consideration of the yield of pleasure involved. Without wishing to include the whole field covered by these phenomena, I have been able, through a chance opportunity which presented itself, to throw some light upon the first game played by a little boy of one and a half and invented by himself. It was more than a mere fleeting observation, for I lived under the same roof as the child and his parents for some weeks, and it was some time before I discovered the meaning of the puzzling activity which he constantly repeated.

The child was not at all precocious in his intellectual development. At the age of one and a half he could say only a few comprehensible words; he could also make use of a number of sounds which expressed a meaning intelligible to those around him. He was, however, on good terms with his parents and their one servant-girl, and tributes were paid to his being a "good boy." He did not disturb his parents at night, he conscientiously obeyed orders not to touch certain things or go into certain rooms, and above all he never cried when his mother left him for a few hours. At the same time, he was greatly attached to his mother, who had not only fed him herself but had also looked after him without any outside help. This good little boy, however, had an occasional disturbing habit of taking any small objects he could get hold of and throwing them away from him into a corner, under the bed, and so on, so that hunting for his toys and picking them up was often quite a business. As he did this he gave vent to a loud, long-drawn-out "o-o-o-o," accompanied by an expression of interest and satisfaction. His mother and the writer of the present account were

agreed in thinking that this was not a mere interjection but represented the German word "*fort*" ["gone"]. I eventually realized that it was a game and that the only use he made of any of his toys was to play "gone" with them. One day I made an observation which confirmed my view. The child had a wooden reel with a piece of string tied round it. It never occurred to him to pull it along the floor behind him, for instance, and play at its being a carriage. What he did was to hold the reel by the string and very skillfully throw it over the edge of his curtained cot, so that it disappeared into it, at the same time uttering his expressive "o-o-o-o." He then pulled the reel out of the cot again by the string and hailed its reappearance with a joyful "*da*" ["there"]. This, then, was the complete game - disappearance and return. As a rule one only witnessed its first act, which was repeated untiringly as a game in itself, though there is no doubt that the greater pleasure was attached to the second act.

The interpretation of the game then became obvious. It was related to the child's great cultural achievement - the instinctual renunciation (that is, the renunciation of instinctual satisfaction) which he had made in allowing his mother to go away without protesting. He compensated himself for this, as it were, by himself staging the disappearance and return of the objects within his reach. It is of course a matter of indifference from the point of view of judging the effective nature of the game whether the child invented it himself or took it over on some outside suggestion. Our interest is directed to another point. The child cannot possibly have felt his mother's departure as something agreeable or even indifferent. How then does his repetition of this distressing experience as a game fit in with the pleasure principle? It may perhaps be said in reply that her departure had to be enacted as a necessary preliminary to her joyful return, and that it was in the latter that lay the true purpose of the game. But against this must be counted the observed fact that the first act, that of departure, was staged as a game in itself and far more frequently than the episode in its entirety, with its pleasurable ending.

No certain decision can be reached from the analysis of a single case like this. On an unprejudiced view one gets an impression that the child turned his experience into a game from another motive. At the outset he was in a passive situation - he was overpowered by the experience; but, by repeating it, unpleasurable though it was, as a game, he took on an active part. These efforts might be put down to an instinct for mastery that was acting independently of whether the memory was in itself pleasurable or not. But still another interpretation may be attempted. Throwing away the object so that it was "gone" might satisfy an impulse of the child's, which was suppressed in his actual life, to revenge himself on his mother for going away from him. In that case it would have a defiant meaning: "All right, then, go away! I don't need you. I'm sending you away myself." A year later, the same boy whom I had observed at his first game used to take a toy, if he was angry with it, and throw it on the floor, exclaiming: "Go to the front!" He had heard at that time that his absent father was "at the front," and was far from regretting his absence; on the contrary he made it quite clear that he had no desire to be disturbed in his sole possession of his mother. We know of other children who liked to express similar hostile impulses by throwing away objects instead of persons. We are therefore left in doubt as to whether the impulse to work over in the mind some overpowering experience so as to make oneself master of it can find expression as a primary event, and independently of the pleasure principle. For, in the case we have been discussing, the child

may, after all, only have been able to repeat his unpleasant experience in play because the repetition carried along with it a yield of pleasure of another sort but none the less a direct one.

Nor shall we be helped in our hesitation between these two views by further considering children's play. It is clear that in their play children repeat everything that has made a great impression on them in real life, and that in doing so they abreact the strength of the impression and, as one might put it, make themselves master of the situation. But on the other hand it is obvious that all their play is influenced by a wish that dominates them the whole time - the wish to be grown-up and to be able to do what grown-up people do. It can also be observed that the unpleasurable nature of an experience does not always unsuit it for play. If the doctor looks down a child's throat or carries out some small operation on him, we may be quite sure that these frightening experiences will be the subject of the next game; but we must not in that connection overlook the fact that there is a yield of pleasure from another source. As the child passes over from the passivity of the experience to the activity of the game, he hands on the disagreeable experience to one of his playmates and in this way revenges himself on a substitute.

Nevertheless, it emerges from this discussion that there is no need to assume the existence of a special imitative instinct in order to provide a motive for play. Finally, a reminder may be added that the artistic play and artistic imitation carried out by adults, which, unlike children's, are aimed at an audience, do not spare the spectators (for instance, in tragedy) the most painful experiences and can yet be felt by them as highly enjoyable. This is convincing proof that, even under the dominance of the pleasure principle, there are ways and means enough of making what is in itself unpleasurable into a subject to be recollected and worked over in the mind. The consideration of these cases and situations, which have a yield of pleasure as their final outcome, should be undertaken by some system of aesthetics with an economic approach to its subject-matter. They are of no use for our purposes, since they presuppose the existence and dominance of the pleasure principle; they give no evidence of the operation of tendencies beyond the pleasure principle, that is, of tendencies more primitive than it and independent of it.

III

Twenty-five years of intense work have had as their result that the immediate aims of psycho-analytic technique are quite other to-day than they were at the outset. At first the analyzing physician could do no more than discover the unconscious material that was concealed from the patient, put it together, and, at the right moment, communicate it to him. Psychoanalysis was then first and foremost an art of interpreting. Since this did not solve the therapeutic problem, a further aim quickly came in view: to oblige the patient to confirm the analyst's construction from his own memory. In that endeavor the chief emphasis lay upon the patient's resistances: the art consisted now in uncovering these as quickly as possible, in pointing them out to the patient and in inducing him by human influence - this was where suggestion operating as "transference" played its part - to abandon his resistances.

But it became ever clearer that the aim which had been set up - the aim that what was unconscious should become conscious - is not completely attainable by that

method. The patient cannot remember the whole of what is repressed in him, and what he cannot remember may be precisely the essential part of it. Thus he acquires no sense of conviction of the correctness of the construction that has been communicated to him. He is obliged to repeat the repressed material as a contemporary experience instead of, as the physician would prefer to see, remembering it as something belonging to the past. These reproductions, which emerge with such un-wished-for exactitude, always have as their subject some portion of infantile sexual life - of the Oedipus complex, that is, and its derivatives; and they are invariably acted out in the sphere of the transference, of the patient's relation to the physician. When things have reached this stage, it may be said that the earlier neurosis has now been replaced by a fresh, "transference neurosis." It has been the physician's endeavor to keep this transference neurosis within the narrowest limits: to force as much as possible into the channel of memory and to allow as little as possible to emerge as repetition. The ratio between what is remembered and what is reproduced varies from case to case. The physician cannot as a rule spare his patient this phase of the treatment. He must get him to re-experience some portion of his forgotten life, but must see to it, on the other hand, that the patient retains some degree of aloofness, which will enable him, in spite of everything, to recognize that what appears to be reality is in fact only a reflection of a forgotten past. If this can be successfully achieved, the patient's sense of conviction is won, together with the therapeutic success that is dependent on it.

In order to make it easier to understand this "compulsion to repeat," which emerges during the psycho-analytic treatment of neurotics, we must above all get rid of the mistaken notion that what we are dealing with in our struggle against resistances is resistance on the part of the unconscious. The unconscious - that is to say, the "repressed" - offers no resistance whatever to the efforts of the treatment. Indeed, it itself has no other endeavor than to break through the pressure weighing down on it and force its way either to consciousness or to a discharge through some real action. Resistance during treatment arises from the same higher strata and systems of the mind which originally carried out repression. But the fact that, as we know from experience, the motives of the resistances, and indeed the resistances themselves, are unconscious at first during the treatment, is a hint to us that we should correct a shortcoming in our terminology. We shall avoid a lack of clarity if we make our contrast not between the conscious and the unconscious but between the coherent ego I and the repressed. It is certain that much of the ego is itself unconscious, and notably what we may describe as its nucleus; only a small part of it is covered by the term "preconscious." Having replaced a purely descriptive terminology by one which is systematic or dynamic, we can say that the patient's resistance arises from his "ego," and we then at once perceive that the compulsion to repeat must be ascribed to the unconscious repressed. It seems probable that the compulsion can only express itself after the work of treatment has gone half-way to meet it and has loosened the repression.

There is no doubt that the resistance of the conscious and unconscious ego operates under the sway of the pleasure principle: it seeks to avoid the unpleasure which would be produced by the liberation of the repressed. Our efforts, on the other hand, are directed towards procuring the toleration of that unpleasure by an appeal to the reality principle. But how is the compulsion to repeat - the manifestation of the power of the repressed - related to the pleasure principle? It is clear that the greater

part of what is re-experienced under the compulsion to repeat must cause the ego unpleasure, since it brings to light activities of repressed instinctual impulses. That, however, is unpleasure of a kind we have already considered and does not contradict the pleasure principle: unpleasure for one system and simultaneously satisfaction for the other. But we come now to a new and remarkable fact, namely that the compulsion to repeat also recalls from the past experiences which include no possibility of pleasure, and which can never, even long ago, have brought satisfaction even to instinctual impulses which have since been repressed.

The early efflorescence of infantile sexual life is doomed to extinction because its wishes are incompatible with reality and with the inadequate stage of development which the child has reached. That efflorescence comes to an end in the most distressing circumstances and to the accompaniment of the most painful feelings. Loss of love and failure leave behind them a permanent injury to self-regard in the form of a narcissistic scar, which in my opinion... contributes more than anything to the "sense of inferiority" which is so common in neurotics. The child's sexual researches, on which limits are imposed by his physical development, lead to no satisfactory conclusion; hence such later complaints as "I can't accomplish anything; I can't succeed in anything." The tie of affection, which binds the child as a rule to the parent of the opposite sex, succumbs to disappointment, to a vain expectation of satisfaction or to jealousy over the birth of a new baby - unmistakable proof of the infidelity of the object of the child's affections. His own attempt to make a baby himself, carried out with tragic seriousness, fails shamefully. The lessening amount of affection he receives, the increasing demands of education, hard words and an occasional punishment - these show him at last the full extent to which he has been scorned. These are a few typical and constantly recurring instances of the ways in which the love characteristic of the age of childhood is brought to a conclusion.

Patients repeat all of these unwanted situations and painful emotions in the transference and revive them with the greatest ingenuity. They seek to bring about the interruption of the treatment while it is still incomplete; they contrive once more to feel themselves scorned, to oblige the physician to speak severely to them and treat them coldly; they discover appropriate objects for their jealousy; instead of the passionately desired baby of their childhood, they produce a plan or a promise of some grand present - which turns out as a rule to be no less unreal. None of these things can have produced pleasure in the past, and it might be supposed that they would cause less unpleasure to-day if they emerged as memories or dreams instead of taking the form of fresh experiences. They are of course the activities of instincts intended to lead to satisfaction; but no lesson has been learnt from the old experience of these activities having led instead only to unpleasure. In spite of that, they are repeated, under pressure of a compulsion.

What psycho-analysis reveals in the transference phenomena of neurotics can also be observed in the lives of some normal people. The impression they give is of being pursued by a malignant fate or possessed by some "daemonic" power; but psychoanalysis has always taken the view that their fate is for the most part arranged by themselves and determined by early infantile influences. The compulsion which is here in evidence differs in no way from the compulsion to repeat which we have found in neurotics, even though the people we are now considering have never shown any signs of dealing with a neurotic conflict by producing symptoms. Thus we have come across people all of whose human relationships have the same outcome:

such as the benefactor who is abandoned in anger after a time by each of his proteges, however much they may otherwise differ from one another, and who thus seems doomed to taste all the bitterness of ingratitude; or the man whose friendships all end in betrayal by his friend; or the man who time after time in the course of his life raises someone else into a position of great private or public authority and then, after a certain interval, himself upsets that authority and replaces him by a new one; or, again, the lover each of whose love affairs with a woman passes through the same phases and reaches the same conclusion. This "perpetual recurrence of the same thing" causes us no astonishment when it relates to active behavior on the part of the person concerned and when we can discern in him an essential character-trait which always remains the same and which is compelled to find expression in a repetition of the same experiences. We are much more impressed by cases where the subject appears to have a passive experience, over which he has no influence, but in which he meets with a repetition of the same fatality. There is the case, for instance, of the woman who married three successive husbands each of whom fell ill soon afterwards and had to be nursed by her on their death-beds. The most moving poetic picture of a fate such as this is given by Tasso in his romantic epic *Gerusalemme Liberata*. Its hero, Tancred, unwittingly kills his beloved Clorinda in a duel while she is disguised in the armor of an enemy knight. After her burial he makes his way into a strange magic forest which strikes the Crusaders' army with terror. He slashes with his sword at a tall tree; but blood streams from the cut and the voice of Glorinda, whose soul is imprisoned in the tree, is heard complaining that he has wounded his beloved once again.

If we take into account observations such as these, based upon behavior in the transference and upon the life-histories of men and women, we shall find courage to assume that there really does exist in the mind a compulsion to repeat which overrides the pleasure principle. Now too we shall be inclined to relate to this compulsion the dreams which occur in traumatic neuroses and the impulse which leads children to play.

But it is to be noted that only in rare instances can we observe the pure effects of the compulsion to repeat, unsupported by other motives. In the case of children's play we have already laid stress on the other ways in which the emergence of the compulsion may be interpreted; the compulsion to repeat and instinctual satisfaction which is immediately pleasurable seem to converge here into an intimate partnership. The phenomena of transference are obviously exploited by the resistance which the ego maintains in its pertinacious insistence upon repression; the compulsion to repeat, which the treatment tries to bring into its service is, as it were, drawn over by the ego to its side (clinging as the ego does to the pleasure principle). A great deal of what might be described as the compulsion of destiny seems intelligible on a rational basis; so that we are under no necessity to call in a new and mysterious motive force to explain it.

Notes

- 1 A further observation subsequently confirmed this interpretation fully. One day the child's mother had been away for several hours and on her return was met with the words "Baby o-o-o-o!" which was at first incomprehensible. It soon turned out, however, that during

this long period of solitude the child had found a method of making *himself* disappear. He had discovered his reflection in a full-length mirror which did not quite reach to the ground, so that by crouching down he could make his mirror-image "gone." [A further reference to this story will be found in *The Interpretation of Dreams, Standard Edition*, 5, p. 461n.]

- 2 When this child was five and three-quarters, his mother died. Now that she was really "gone" ("o-o-o"), the little boy showed no signs of grief. It is true that in the interval a second child had been born and had roused him to violent jealousy.
- 3 Cf. my note on a childhood memory of Goethe's (1917b).
- 4 See my paper on "Recollecting, Repeating and Working Through" (*Standard Edition*, 12). [An early reference will be found in this same paper to the "compulsion to repeat," which is one of the principal topics discussed in the present work. The term "transference neurosis" in the special sense in which it is used a few lines lower down also appears in that paper.]
- 5 [Footnote added 1923:] I have argued elsewhere that what thus comes to the help of the compulsion to repeat is the factor of "suggestion" in the treatment - that is, the patient's submissiveness to the physician, which has its roots deep in his unconscious parental complex.
- 6 Cf. the apt remarks on this subject by C. G. Jung, "The Significance of the Father in the Destiny of the Individual," *Collected Papers on Analytic Psychology* (London, 1916), p. 156.

Group Psychology and the Analysis of the Ego

Sigmund Freud

In this essay from 1921, Freud put forth an important concept for later psychoanalysis - identification. The child's ability to internalize representations of caregivers and others in its immediate social environment lies at the heart of later object relations theory. It seeks to account for the social character of the self, the way it is built up from relations with others. Freud here also hints at a more sociological version of the very dubious ideas of "castration" and of "castration complex," ideas that mistakenly turn historically specific and local cultural anecdotes about threats issued to children into psychological and anthropological principles. In that sociological account, what Freud calls "castration anxiety" would be seen as a misinterpretation or misnaming of an anxiety any young person feels as he or she undergoes the passage into sexual adulthood. The anxiety over loss has to do more with an anxiety over being able to fulfill the demands of the social ideal of adult sexual identity. One way of achieving an adult identity is to identify with the father or mother and to attempt to emulate them.

Identification is known to psycho-analysis as the earliest expression of an emotional tie with another person. It plays a part in the early history of the Oedipus complex. A little boy will exhibit a special interest in his father; he would like to grow like him and be like him, and take his place everywhere. We may say simply that he takes his father as his ideal. This behavior has nothing to do with a passive or feminine attitude towards his father (and towards males in general); it is on the contrary typically masculine. It fits in very well with the Oedipus complex, for which it helps to prepare the way.

At the same time as this identification with his father, or a little later, the boy has begun to develop a true object-cathexis towards his mother according to the attachment [anaclitic] type. He then exhibits, therefore, two psychologically distinct ties: a straightforward sexual object-cathexis towards his mother and an identification with his father which takes him as his model. The two subsist side by side for a time without any mutual influence or interference. In consequence of the irresistible advance towards a unification of mental life, they come together at last; and the normal Oedipus complex originates from their confluence. The little boy notices that his father stands in his way with his mother. His identification with his father then takes on a hostile coloring and becomes identical with the wish to replace his father in regard to his mother as well. Identification, in fact, is ambivalent from the very first; it can turn into an expression of tenderness as easily as into a wish for some-

one's removal. It behaves like a derivative of the first, *oral* phase of the organization of the libido, in which the object that we long for and prize is assimilated by eating and is in that way annihilated as such. The cannibal, as we know, has remained at this standpoint; he has a devouring affection for his enemies and only devours people of whom he is fond.¹

The subsequent history of this identification with the father may easily be lost sight of. It may happen that the Oedipus complex becomes inverted, and that the father is taken as the object of a feminine attitude, an object from which the directly sexual instincts look for satisfaction; in that event the identification with the father has become the precursor of an object-tie with the father. The same holds good, with the necessary substitutions, of the baby daughter as well.

It is easy to state in a formula the distinction between an identification with the father and the choice of the father as an object. In the first case one's father is what one would like to *be*, and in the second he is what one would like to *have*. The distinction, that is, depends upon whether the tie attaches to the subject or to the object of the ego. The former kind of tie is therefore already possible before any sexual object-choice has been made. It is much more difficult to give a clear meta-psychological representation of the distinction. We can only see that identification endeavors to mold a person's own ego after the fashion of the one that has been taken as a model.

Let us disentangle identification as it occurs in the structure of a neurotic symptom from its rather complicated connections. Supposing that a little girl (and we will keep to her for the present) develops the same painful symptom as her mother - for instance, the same tormenting cough. This may come about in various ways. The identification may come from the Oedipus complex; in that case it signifies a hostile desire on the girl's part to take her mother's place, and the symptom expresses her object-love towards her father, and brings about a realization, under the influence of a sense of guilt, of her desire to take her mother's place: "You wanted to be your mother, and now you *are* - anyhow so far as your sufferings are concerned." This is the complete mechanism of the structure of a hysterical symptom. Or, on the other hand, the symptom may be the same as that of the person who is loved; so, for instance, Dora imitated her father's cough. In that case we can only describe the state of things by saying *that identification has appeared instead of object-choice, and that object-choice has regressed to identification*. We have heard that identification is the earliest and original form of emotional tie; it often happens that under the conditions in which symptoms are constructed, that is, where there is repression and where the mechanisms of the unconscious are dominant, object-choice is turned back into identification - the ego assumes the characteristics of the object. It is noticeable that in these identifications the ego sometimes copies the person who is not loved and sometimes the one who is loved. It must also strike us that in both cases the identification is a partial and extremely limited one and only borrows a single trait from the person who is its object.

There is a third particularly frequent and important case of symptom formation, in which the identification leaves entirely out of account any object-relation to the person who is being copied. Supposing, for instance, that one of the girls in a boarding school has had a letter from someone with whom she is secretly in love which arouses her jealousy, and that she reacts to it with a fit of hysterics; then some of her friends who know about it will catch the fit, as we say, by mental infection.

The mechanism is that of identification based upon the possibility or desire of putting oneself in the same situation. The other girls would like to have a secret love affair too, and under the influence of a sense of guilt they also accept the suffering involved in it. It would be wrong to suppose that they take on the symptom out of sympathy. On the contrary, the sympathy only arises out of the identification, and this is proved by the fact that infection or imitation of this kind takes place in circumstances where even less pre-existing sympathy is to be assumed than usually exists between friends in a girls' school. One ego has perceived a significant analogy with another upon one point - in our example upon openness to a similar emotion; an identification is thereupon constructed on this point, and, under the influence of the pathogenic situation, is displaced on to the symptom which the one ego has produced. The identification by means of the symptom has thus become the mark of a point of coincidence between the two egos which has to be kept repressed.

What we have learned from these three sources may be summarized as follows. First, identification is the original form of emotional tie with an object; secondly, in a regressive way it becomes a substitute for a libidinal object-tie, as it were by means of introjection of the object into the ego; and thirdly, it may arise with any new perception of a common quality shared with some other person who is not an object of the sexual instinct. The more important this common quality is, the more successful may this partial identification become, and it may thus represent the beginning of a new tie.

The Mirror Stage as Formative of the Function of the I as Revealed in Psychoanalytic Experience

Jacques Lacan

Jacques Lacan's *Ecrits* (1966) was the most influential work of structuralist psychoanalysis. Lacan's work constitutes a rebuke to ego or self psychology and a return to Freud's belief in the power of the unconscious in human life. Yet his work also rewrites Freud in important ways. He inserts the self into culture. We are all shaped by the Symbolic order into which we are born, an order that determines our gender identity and our place in our families. When we learn to make symbols, we also learn to separate from our ambient childhood world of objects and achieve an independent selfhood that is experienced as loss. That lack can never be filled, and all human desire circulates around it, yearning to hark back to the lost unity. Lacan calls such yearning and the kind of consciousness it provokes the Imaginary. It is the narcissistic part of the mind that defines ego activity. Lacan placed great emphasis on Freud's contention that the ego deludes itself into thinking it controls the mind. What the ego cannot reach or know is the Real, the realm of the drives, the instincts, and the unconscious processes that shape our selves but that cannot be known by a mind that constitutes itself as the effacement of such determination. In this famous essay from 1949, Lacan describes his concept of the self as a delusory construct plagued in its very constitution by imaginary identifications with a spurious sense of wholeness or unity. Lacan's polemic is directed against those ego psychologists who were just beginning in England and America to explore the possibility that psychoanalysis should focus on the whole complex of the self in its social setting rather than on the dynamic interrelations between consciousness and the unconscious.

The conception of the mirror stage that I introduced at our last congress, thirteen years ago, has since become more or less established in the practice of the French group. However, I think it worthwhile to bring it again to your attention, especially today, for the light it sheds on the formation of the I as we experience it in psychoanalysis. It is an experience that leads us to oppose any philosophy directly issuing from the *Cogito*.

Some of you may recall that this conception originated in a feature of human behavior illuminated by a fact of comparative psychology. The child, at an age when he is for a time, however short, outdone by the chimpanzee in instrumental intelligence, can nevertheless already recognize as such his own image in a mirror. This recognition is indicated in the illuminative mimicry of the *Aha-Erlebnis*, which

Kohler sees as the expression of situational apperception, an essential stage of the act of intelligence.

This act, far from exhausting itself, as in the case of the monkey, once the image has been mastered and found empty, immediately rebounds in the case of the child in a series of gestures in which he experiences in play the relation between the movements assumed in the image and the reflected environment, and between this virtual complex and the reality it reduplicates - the child's own body, and the persons and things, around him.

This event can take place, as we have known since Baldwin, from the age of six months, and its repetition has often made me reflect upon the startling spectacle of the infant in front of the mirror. Unable as yet to walk, or even to stand up, and held tightly as he is by some support, human or artificial (what, in France, we call a "*trotte-bebe*"), he nevertheless overcomes, in a flutter of jubilant activity, the obstructions of his support and, fixing his attitude in a slightly leaning-forward position, in order to hold it in his gaze, brings back an instantaneous aspect of the image.

For me, this activity retains the meaning I have given it up to the age of eighteen months. This meaning discloses a libidinal dynamism, which has hitherto remained problematic, as well as an ontological structure of the human world that accords with my reflections on paranoid knowledge.

We have only to understand the mirror stage as an *identification*, in the full sense that analysis gives to the term: namely, the transformation that takes place in the subject when he assumes an image - whose predestination to this phase-effect is sufficiently indicated by the use, in analytic theory, of the ancient term *imago*.

This jubilant assumption of his specular image by the child at the *infans* stage, still sunk in his motor incapacity and nursling dependence, would seem to exhibit in an exemplary situation the symbolic matrix in which the I is precipitated in a primordial form, before it is objectified in the dialectic of identification with the other, and before language restores to it, in the universal, its function as subject.

This form would have to be called the Ideal-I, if we wished to incorporate it into our usual register, in the sense that it will also be the source of secondary identifications, under which term I would place the functions of libidinal normalization. But the important point is that this form situates the agency of the ego, before its social determination, in a fictional direction, which will always remain irreducible for the individual alone, or rather, which will only rejoin the coming-into-being (*le devenir*) of the subject asymptotically, whatever the success of the dialectical syntheses by which he must resolve as I his discordance with his own reality.

The fact is that the total form of the body by which the subject anticipates in a mirage the maturation of his power is given to him only as *Gestalt*, that is to say, in an exteriority in which this form is certainly more constituent than constituted, but in which it appears to him above all in a contrasting size (*un relief de stature*) that fixes it and in a symmetry that inverts it, in contrast with the turbulent movements that the subject feels are animating him. Thus, this *Gestalt* - whose pregnancy should be regarded as bound up with the species, though its motor style remains scarcely recognizable - by these two aspects of its appearance, symbolizes the mental permanence of the I, at the same time as it prefigures its alienating destination; it is still pregnant with the correspondences that unite the I with the statue in which man projects himself, with the phantoms that dominate him, or with the automaton in

which, in an ambiguous relation, the world of his own making tends to find completion.

Indeed, for the *imagos* - whose veiled faces it is our privilege to see in outline in our daily experience and in the penumbra of symbolic efficacy - the mirror-image would seem to be the threshold of the visible world, if we go by the mirror disposition that the *imago of one's own body* presents in hallucinations or dreams, whether it concerns its individual features, or even its infirmities, or its object-projections; or if we observe the role of the mirror apparatus in the appearances of the *double*, in which psychical realities, however heterogeneous, are manifested.

That a *Gestalt* should be capable of formative effects in the organism is attested by a piece of biological experimentation that is itself so alien to the idea of psychical causality that it cannot bring itself to formulate its results in these terms. It nevertheless recognizes that it is a necessary condition for the maturation of the gonad of the female pigeon that it should see another member of its species, of either sex; so sufficient in itself is this condition that the desired effect may be obtained merely by placing the individual within reach of the field of reflection of a mirror. Similarly, in the case of the migratory locust, the transition within a generation from the solitary to the gregarious form can be obtained by exposing the individual, at a certain stage, to the exclusively visual action of a similar image, provided it is animated by movements of a style sufficiently close to that characteristic of the species. Such facts are inscribed in an order of homeomorphic identification that would itself fall within the larger question of the meaning of beauty as both formative and erogenic.

But the facts of mimicry are no less instructive when conceived as cases of heteromorphic identification, in as much as they raise the problem of the signification of space for the living organism - psychological concepts hardly seem less appropriate for shedding light on these matters than ridiculous attempts to reduce them to the supposedly supreme law of adaptation. We have only to recall how Roger Caillois (who was then very young, and still fresh from his breach with the sociological school in which he was trained) illuminated the subject by using the term "*legendary psychasthenia*" to classify morphological mimicry as an obsession with space in its derealizing effect.

I have myself shown in the social dialectic that structures human knowledge as paranoiac why human knowledge has greater autonomy than animal knowledge in relation to the field of force of desire, but also why human knowledge is determined in that "little reality" (*ice peu de realite*), which the Surrealists, in their restless way, saw as its limitation. These reflections lead me to recognize in the spatial captation manifested in the mirror stage, even before the social dialectic, the effect in man of an organic insufficiency in his natural reality - in so far as any meaning can be given to the word "nature."

I am led, therefore, to regard the function of the mirror stage as a particular case of the function of the *imago*, which is to establish a relation between the organism and its reality - or, as they say, between the *Innenwelt* and the *Umwelt*.

In man, however, this relation to nature is altered by a certain dehiscence at the heart of the organism, a primordial discord betrayed by the signs of uneasiness and motor uncoordination of the neonatal months. The objective notion of the anatomical incompleteness of the pyramidal system and likewise the presence of certain humoral residues of the maternal organism confirm the view I have formulated as the fact of a real *specific prematurity of birth* in man.

It is worth noting, incidentally, that this is a fact recognized as such by embryologists, by the term *foetalization*, which determines the prevalence of the so-called superior apparatus of the neurax, and especially of the cortex, which psycho-surgical operations lead us to regard as the intraorganic mirror.

This development is experienced as a temporal dialectic that decisively projects the formation of the individual into history. The *mirror stage* is a drama whose internal thrust is precipitated from insufficiency to anticipation and which manufactures for the subject, caught up in the lure of spatial identification, the succession of phantasies that extends from a fragmented body-image to a form of its totality that I shall call orthopaedic - and, lastly, to the assumption of the armor of an alienating identity which will mark with its rigid structure the subject's entire mental development. Thus, to break out of the circle of the *Innenwelt* into the *Umwelt* generates the inexhaustible quadrature of the ego's verifications.

This fragmented body - which term I have also introduced into our system of theoretical references - usually manifests itself in dreams when the movement of the analysis encounters a certain level of aggressive disintegration in the individual. It then appears in the form of disjointed limbs, or of those organs represented in exoscopy, growing wings and taking up arms for intestinal persecutions - the very same that the visionary Hieronymus Bosch has fixed, for all time, in painting, in their ascent from the fifteenth century to the imaginary zenith of modern man. But this form is even tangibly revealed at the organic level, in the lines of "fragilization" that define the anatomy of phantasy, as exhibited in the schizoid and spasmodic symptoms of hysteria.

Correlatively, the formation of the I is symbolized in dreams by a fortress, or a stadium - its inner arena and enclosure, surrounded by marshes and rubbish-tips, dividing it into two opposed fields of contest where the subject flounders in quest of the lofty, remote inner castle whose form (sometimes juxtaposed in the same scenario) symbolizes the id in a quite startling way. Similarly, on the mental plane, we find realized the structures of fortified works, the metaphor of which arises spontaneously, as if issuing from the symptoms themselves, to designate the mechanisms of obsessional neurosis - inversion, isolation, splitting, negation and displacement.

But if we were to build on these subjective givens alone - however little we free them from the condition of experience that makes us see them as partaking of the nature of a linguistic technique - our theoretical attempts would remain exposed to the charge of projecting themselves into the unthinkable of an absolute subject. This is why I have sought in the present hypothesis, grounded in a conjunction of objective data, the guiding grid for a *method of symbolic reduction*.

It establishes in the *defenses of the ego* a genetic order, in accordance with the wish formulated by Miss Anna Freud, in the first part of her great work, and situates (as against a frequently expressed prejudice) hysterical repression and its returns at a more archaic stage than obsessional inversion and its isolating processes, and the latter in turn as preliminary to paranoia alienation, which dates from the deflection of the specular I into the social I.

This moment in which the mirror stage comes to an end inaugurates, by the identification with the *imago* of the counterpart and the drama of primordial jealousy (so well brought out by the school of Charlotte Buhler in the phenomenon of infantile *transitivism*), the dialectic that will henceforth link the I to socially elaborated situations.

It is this moment that decisively tips the whole of human knowledge into mediation through the desire of the other, constitutes its objects in an "abstract" equivalence by the cooperation of others, and turns the I into that apparatus for which every instinctual thrust constitutes a danger, even though it should correspond to a natural maturation - the very normalization of this maturation being henceforth dependent, in man, on a cultural mediation as exemplified, in the case of the sexual object, by the Oedipus complex.

In the light of this conception, the term primary narcissism, by which analytic doctrine designates the libidinal investment characteristic of that moment, reveals in those who invented it the most profound awareness of semantic latencies. But it also throws light on the dynamic opposition between this libido and the sexual libido, which the first analysts tried to define when they invoked destructive and, indeed, death instincts, in order to explain the evident connection between the narcissistic libido and the alienating function of the I, the aggressivity it releases in any relation to the other, even in a relation involving the most Samaritan of aid.

In fact, they were encountering that existential negativity whose reality is so vigorously proclaimed by the contemporary philosophy of being and nothingness.

But unfortunately that philosophy grasps negativity only within the limits of a self-sufficiency of consciousness, which, as one of its premises, links to the *meconnaissances* [misrecognitions] that constitute the ego, the illusion of autonomy to which it entrusts itself. This flight of fancy, for all that it draws, to an unusual extent, on borrowings from psychoanalytic experience, culminates in the pretention of providing an existential psychoanalysis.

At the culmination of the historical effort of a society to refuse to recognize that it has any function other than the utilitarian one, and in the anxiety of the individual confronting the "concentrational" form of the social bond that seems to arise to crown this effort, existentialism must be judged by the explanations it gives of the subjective impasses that have indeed resulted from it; a freedom that is never more authentic than when it is within the walls of a prison; a demand for commitment, expressing the impotence of a pure consciousness to master any situation; a voyeuristic-sadistic idealization of the sexual relation; a personality that realizes itself only in suicide; a consciousness of the other that can be satisfied only by Hegelian murder.

These propositions are opposed by all our experience, in so far as it teaches us not to regard the ego as centered on the *perception-consciousness system* or as organized by the "reality principle" - a principle that is the expression of a scientific prejudice most hostile to the dialectic of knowledge. Our experience shows that we should start instead from the *function of meconnaissance* that characterizes the ego in all its structures so markedly articulated by Miss Anna Freud. For, if the *Verneinung* [denial] represents the patent form of that function, its effects will, for the most part, remain latent, so long as they are not illuminated by some light reflected on to the level of fatality, which is where the id manifests itself.

We can thus understand the inertia characteristic of the formations of the I, and find there the most extensive definition of neurosis - just as the captation of the subject by the situation gives us the most general formula for madness, not only the madness that lies behind the walls of asylums, but also the madness that deafens the world with its sound and fury.

The sufferings of neurosis and psychosis are for us a schooling in the passions of the soul, just as the beam of the psychoanalytic scales, when we calculate the tilt of

its threat to entire communities, provides us with an indication of the deadening of the passions in society.

At this junction of nature and culture, so persistently examined by modern anthropology, psychoanalysis alone recognizes this knot of imaginary servitude that love must always undo again, or sever.

For such a task, we place no trust in altruistic feeling, we who lay bare the aggressivity that underlies the activity of the philanthropist, the idealist, the pedagogue, and even the reformer.

In the recourse of subject to subject that we preserve, psychoanalysts may accompany the patient to the ecstatic limit of the "*Thou art that*" in which is revealed to him the cipher of his mortal destiny, but it is not in our mere power as practitioners to bring him to that point where the real journey begins.

Notes

- 1 Throughout this article I leave in its peculiarity the translation I have adopted for Freud's *Ideal-Ich* [i.e., "je-ideal"], without further comment, other than to say that I have not maintained it since.

- 4 "*Concentrationnaire*," an adjective coined after World War II (this article was written in 1949) to describe the life of the concentration-camp. In the hands of certain writers it became, by extension, applicable to many aspects of "modern" life. [Trans.]

The Instance of the Letter In the Unconscious or Reason since Freud

Jacques Lacan

In this 1957 essay, Lacan incorporates Saussure's structural linguistics into his account of how desire works in humans. He notes that, for Saussure, signifiers move along a chain and never reach a signified. Signifiers are determined by their relations of difference to other signifiers, and their relationship to real referents is arbitrary. The move away from any signifier toward a signified merely takes one to other signifiers. The road to the signified is blocked by the essential difference between the realm of interconnected signifiers and the realm of meanings or referents that are of a completely different order and that can be signified in their absence from language only through conventional agreements. Lacan describes this difference of realms as a bar separating the signifier from the signified, and he compares it to the bar separating consciousness from the unconscious. Like the signified or referent, the content of the unconscious can be signified obliquely but never revealed as such.

Desire operates in a similar way. First, what we desire is always a signifier of something else. What we desire is desirable because it satisfies urges that hark back to our primordial experience of unity with our mother's body. All desire is shaped by that first experience, and all desired objects signify it. But that lost unity is unattainable; it is the condition of our being to be in a state of lack in relation to it. Something like a bar, then, separates our conscious yearnings from the unconscious. Our desire is motivated by the unconscious and by unconscious residues, but desire must remain in the realm of consciousness. It latches on to objects that can signify the unconscious but only as something inaccessible.

Lacan also uses rhetorical terms to account for the structure of desire. Metaphor, whereby one term substitutes for another, is his name for the relation between desire and its unconscious source. The desired object is a substitute for the real unattainable object (the mother's body; the original lost unity) whose residue in the unconscious provokes desire. Such desire can only move from one desired object to another; it can never attain its goal of restoring that lost unity of the self. It therefore resembles metonymy, which consists of reference from part to whole or between one adjacent object to another. Desire is thus a movement along a chain of desired objects, all contiguously connected, that can never convert themselves into the object of desire.

As my title suggests, beyond this "speech," what the psychoanalytic experience discovers in the unconscious is the whole structure of language. Thus from the outset I have alerted informed minds to the extent to which the notion that the unconscious is merely the seat of the instincts will have to be rethought. But how are we to take this "letter" here? Quite simply, literally.

By "letter" I designate that material support that concrete discourse borrows from language.

This simple definition assumes that language is not to be confused with the various psychical and somatic functions that serve it in the speaking subject - primarily because language and its structure exist prior to the moment at which each subject at a certain point in his mental development makes his entry into it.

Let us note then that aphasias, although caused by purely anatomical lesions in the cerebral apparatus that supplies the mental center for these functions, prove, on the whole, to distribute their deficits between the two sides of the signifying effect of what we call here "the letter" in the creation of signification. A point that will be clarified later.

Thus the subject, too, if he can appear to be the slave of language, is all the more so of a discourse in the universal movement in which his place is already inscribed at birth, if only by virtue of his proper name.

Reference to the experience of the community, or to the substance of this discourse, settles nothing. For this experience assumes its essential dimension in the tradition that this discourse itself establishes. This tradition, long before the drama of history is inscribed in it, lays down the elementary structures of culture. And these very structures reveal an ordering of possible exchanges which, even if unconscious, is inconceivable outside the permutations authorized by language[^]

With the result that the ethnographic duality of nature and culture is giving way to a ternary conception of the human condition - nature, society, and culture - the last term of which could well be reduced to language, or that which essentially distinguishes human society from natural societies ____

To pinpoint the emergence of linguistic science we may say that, as in the case of all sciences in the modern sense, it is contained in the constitutive moment of an algorithm that is its foundation. This algorithm is the following:

$$\begin{array}{c} S \\ \hline s \end{array}$$

which is read as: the signifier over the signified, "over" corresponding to the bar separating the two stages ____

The thematics of this science is henceforth suspended, in effect, at the primordial position of the signifier and the signified as being distinct orders separated initially by a barrier resisting signification. And that is what was to make possible an exact study of the connections proper to the signifier, and of the extent of their function in the genesis of the signified.

For this primordial distinction goes well beyond the discussion concerning the arbitrariness of the sign, as it has been elaborated since the earliest reflections of the ancients, and even beyond the impasse which, through the same period, has been encountered in every discussion of the bi-univocal correspondence between the word and the thing, if only in the mere act of naming. All this, of course, is quite contrary to the appearances suggested by the importance often imputed to the role of the index finger pointing to an object in the learning process of the *infans* subject learning his mother tongue, of the use in foreign language teaching of so-called "concrete" methods.

One cannot go further along this line of thought than to demonstrate that no signification can be sustained other than by reference to another signification: in its

extreme form this amounts to the proposition that there is no language (*langue*) in existence for which there is any question of its inability to cover the whole field of the signified, it being an effect of its existence as a language (*langue*) that it necessarily answers all needs. If we try to grasp in language the constitution of the object, we cannot fail to notice that this constitution is to be found only at the level of concept, a very different thing from a simple nominative, and that the *thing*, when reduced to the noun, breaks up into the double, divergent beam of the "cause" (*causa*) in which it has taken shelter in the French word *chose*, and the nothing (*rien*) to which it has abandoned its Latin dress (*rem*).

These considerations, important as their existence is for the philosopher, turn us away from the locus in which language questions us as to its very nature. And we will fail to pursue the question further as long as we cling to the illusion that the signifier answers to the function of representing the signified, or better, that the signifier has to answer for its existence in the name of any signification whatever.

For even reduced to this latter formulation, the heresy is the same - the heresy that leads logical positivism in search of the "meaning of meaning," as its objective is called in the language of the devotees. As a result, we can observe that even a text highly charged with meaning can be reduced, through this sort of analysis, to insignificant bagatelles, all that survives being mathematical algorithms that are, of course, without any meaning.

To return to our formula S/s: if we could infer nothing from it but the notion of the parallelism of its upper and lower terms, each one taken in its globality, it would remain the enigmatic sign of a total mystery. Which of course is not the case.

In order to grasp its function I shall begin by reproducing the classic yet faulty illustration... by which its usage is normally introduced, and one can see how it opens the way to the kind of error referred to above.

In my lecture, I replaced this illustration with another, which has no greater claim to correctness than that it has been transplanted into that incongruous dimension that the psychoanalyst has not yet altogether renounced because of his quite justified feeling that his conformism takes its value entirely from it. Here is the other diagram:

where we see that, without greatly extending the scope of the signifier concerned in the experiment, that is, by doubling a noun through the mere juxtaposition of two terms whose complementary meanings ought apparently to reinforce each other, a surprise is produced by an unexpected precipitation of an unexpected meaning: the image of twin doors symbolizing, through the solitary confinement offered Western Man for the satisfaction of his natural needs away from home, the imperative that he seems to share with the great majority of primitive communities by which his public life is subjected to the laws of urinary segregation.

It is not only with the idea of silencing the nominalist debate with a low blow that I use this example, but rather to show how in fact the signifier enters the signified, namely, in a form which, not being immaterial, raises the question of its place in reality. For the blinking gaze of a short-sighted person might be justified in wondering whether this was indeed the signifier as he peered closely at the little enamel signs that bore it, a signifier whose signified would in this call receive its final honors from the double and solemn procession from the upper nave.

But no contrived example can be as telling as the actual experience of truth. So I am happy to have invented the above, since it awoke in the person whose word I most trust a memory of childhood, which having thus happily come to my attention is best placed here.

A train arrives at a station. A little boy and a little girl, brother and sister, are seated in a compartment face to face next to the window through which the buildings along the station platform can be seen passing as the train pulls to a stop. "Look," says the brother, "we're at Ladies!"; "Idiot!" replies his sister, "Can't you see we're at Gentlemen."

Besides the fact that the rails in this story materialize the bar in the Saussurian algorithm (and in a form designed to suggest that its resistance may be other than dialectical), we should add that only someone who didn't have his eyes in front of the holes (it's the appropriate image here) could possibly confuse the place of the signifier and the signified in this story, or not see from what radiating center the signifier sends forth its light into the shadow of incomplete significations ____

One thing is certain: if the algorithm S/s with its bar is appropriate, access from one to the other cannot in any case have a signification. For in so far as it is itself only pure function of the signifier, the algorithm can reveal only the structure of a signifier in this transfer.

Now the structure of the signifier is, as it is commonly said of language itself, that it should be articulated.

This means that no matter where one starts to designate their reciprocal encroachments and increasing inclusions, these units are subjected to the double condition of being reducible to ultimate differential elements and of combining them according to the laws of a closed order.

These elements, one of the decisive discoveries of linguistics, are *phonemes*] but we must not expect to find any *phonetic* constancy in the modulatory variability to which this term applies, but rather the synchronic system of differential couplings necessary for the discernment of sounds in a given language. Through this, one sees that an essential element of the spoken word itself was predestined to flow into the mobile characters which, in a jumble of lower-case Didots or Garamonds, render validly present what we call the "letter," namely, the essentially localized structure of the signifier.

With the second property of the signifier, that of combining according to the laws of a closed order, is affirmed the necessity of the topological substratum of which the term I ordinarily use, namely, the signifying chain, gives an approximate idea: rings of a necklace that is a ring in another necklace made of rings.

Such are the structural conditions that define grammar as the order of constitutive encroachments of the signifier up to the level of the unit immediately superior to the sentence, and lexicology as the order of institutive inclusions of the signifier to the level of the verbal locution.

In examining the limits by which these two exercises in the understanding of linguistic usage are determined, it is easy to see that only the correlations between signifier and signified provide the standard for all research into signification, as is indicated by the notion of "usage" of a taxeme or semanteme which in fact refers to the context just above that of the units concerned.

But it is not because the undertakings of grammar and lexicology are exhausted within certain limits that we must think that beyond those limits signification reigns supreme. That would be an error.

For the signifier, by its very nature, always anticipates meaning by unfolding its dimension before it. As is seen at the level of the sentence when it is interrupted before the significant term: "I shall never...," "All the same it is...," "And yet there may be ____" Such sentences are not without meaning, a meaning all the more oppressive in that it is content to make us wait for it.

But the phenomenon is no different which by the mere recoil of a "but" brings to the light, comely as the Shulamite, honest as the dew, the negress adorned for the wedding and poor woman ready for the auction-block.

From which we can say that it is in the chain of the signifier that the meaning "insists" but that none of its elements "consists" in the signification of which it is at the moment capable.

We are forced, then, to accept the notion of an incessant sliding of the signified under the signifier - which Ferdinand de Saussure illustrates with an image resembling the wavy lines of the upper and lower Waters in miniatures from manuscripts of Genesis; a double flux marked by fine streaks of rain, vertical dotted lines supposedly confining segments of correspondence.

All our experience runs counter to this linearity, which made me speak once, in one of my seminars on psychosis, of something more like "anchoring points" (*"points de capiton"*) as a schema for taking into account the dominance of the letter in the dramatic transformation that dialogue can effect in the subject.

The linearity that Saussure holds to be constitutive of the chain of discourse, in conformity with its emission by a single voice and with its horizontal position in our writing - if this linearity is necessary, in fact, it is not sufficient. It applies to the chain of discourse only in the direction in which it is orientated in time, being taken as a signifying factor in all languages in which "Peter hits Paul" reverses its time when the terms are inverted.

But one has only to listen to poetry, which Saussure was no doubt in the habit of doing, for a polyphony to be heard, for it to become clear that all discourse is aligned along the several staves of a score.

There is in effect no signifying chain that does not have, as if attached to the punctuation of each of its units, a whole articulation of relevant contexts suspended "vertically," as it were, from that point.

Let us take our word "tree" again, this time not as an isolated noun but at the point of one of these punctuations, and see how it crosses the bar of the Saussurian algorithm. (The anagram of "*arbre*" and "*barre*" should be noted.)

For even broken down into the double specter of its vowels and consonants, it can still call up with the robur and the plane tree the significations it takes on, in the context of our flora, of strength and majesty. Drawing on all the symbolic contexts suggested in the Hebrew of the Bible, it erects on a barren hill the shadow of the cross. Then reduces to the capital Y, the sign of dichotomy which, except for the illustration used by heraldry, would owe nothing to the tree however genealogical we may think it. Circulatory tree, tree of life of the cerebellum, tree of Saturn, tree of Diana, crystals formed in a tree struck by lightning, is it your figure that traces our destiny for us in the tortoise-shell cracked by the fire, or your lightning that causes that slow shift in the axis of being to surge up from an unnameable night into the *Enpanta* of language:

No! says the Tree, it says No! in the shower of sparks
Of its superb head

lines that require the harmonics of the tree just as much as their continuation:

Which the storm treats as universally
As it does a blade of grass.⁵

For this modern verse is ordered according to the same law of the parallelism of the signifier that creates the harmony governing the primitive Slavic epic or the most refined Chinese poetry.

As is seen in the fact that the tree and the blade of grass are chosen from the same mode of the existent in order for the signs of contradiction - saying "No!" and "treat as" - to affect them, and also so as to bring about, through the categorical contrast of the particularity of "superb" with the "universally" that reduces it, in the condensation of the "head" (*itete*) and the "storm" (*tempe*), the indiscernible shower of sparks of the eternal instant.

But this whole signifier can only operate, it may be said, if it is present in the subject. It is this objection that I answer by supposing that it has passed over to the level of the signified.

For what is important is not that the subject know anything whatsoever. (If LADIES and GENTLEMEN were written in a language unknown to the little boy and girl, their quarrel would simply be the more exclusively a quarrel over words, but no less ready to take on signification.)

What this structure of the signifying chain discloses is the possibility I have, precisely in so far as I have this language in common with other subjects, that is to say, in so far as it exists as a language, to use it in order to signify *something quite other* than what it says. This function of speech is more worth pointing out than that of "disguising the thought" (more often than not indefinable) of the subject; it is no less than the function of indicating the place of this subject in the search for the true.

I have only to plant my tree in a locution; climb the tree, even project on to it the cunning illumination a descriptive context gives to a word; raise it (*arborer*) so as not to let myself be imprisoned in some sort of *communiqué* of the facts, however official, and if I know the truth, make it heard, in spite of all the *between-the-lines* censures by

the only signifier my acrobatics through the branches of the tree can constitute, provocative to the point of burlesque, or perceptible only to the practiced eye, according to whether I wish to be heard by the mob or by the few.

The properly signifying function thus depicted in language has a name. We learned this name in some grammar of our childhood, on the last page, where the shade of Quintilian, relegated to some phantom chapter concerning "final considerations on style," seemed suddenly to speed up his voice in an attempt to get in all he had to say before the end.

It is among the figures of style, or tropes - from which the verb "to find" (*trouver*) comes to us - that this name is found. This name is *metonymy*.

I shall refer only to the example given there: "thirty sails." For the disquietude I felt over the fact that the word "ship," concealed in this expression, seemed, by taking on its figurative sense, through the endless repetition of the same old example, only to increase its presence, obscured (*voilait*) not so much those illustrious sails (*voiles*) as the definition they were supposed to illustrate.

The part taken for the whole, we said to ourselves, and if the thing is to be taken seriously, we are left with very little idea of the importance of this fleet, which "thirty sails" is precisely supposed to give us: for each ship to have just one sail is in fact the least likely possibility.

By which we see that the connexion between ship and sail is nowhere but in the signifier, and that it is in the *word-to-word* connexion that metonymy is based.⁶

I shall designate as metonymy, then, the one side (*versant*) of the effective field constituted by the signifier, so that meaning can emerge there.

The other side is *metaphor*. Let us immediately find an illustration; Quillet's dictionary seemed an appropriate place to find a sample that would not seem to be chosen for my own purposes, and I didn't have to go any further than the well-known line of Victor Hugo:

His sheaf was neither miserly nor spiteful...⁷

under which aspect I presented metaphor in my seminar on the psychoses.

It should be said that modern poetry and especially the Surrealist school have taken us a long way in this direction by showing that any conjunction of two signifiers would be equally sufficient to constitute a metaphor, except for the additional requirement of the greatest possible disparity of the images signified, needed for the production of the poetic spark, or in other words for metaphoric creation to take place ____

The creative spark of the metaphor does not spring from the presentation of two images, that is, of two signifiers equally actualized, it flashes between two signifiers one of which has taken the place of the other in the signifying chain, the occulted signifier remaining present through its (metonymic) connexion with the rest of the chain.

One word for another: that is the formula for the metaphor....

It is obvious that in the line of Hugo cited above, not the slightest spark of light springs from the proposition that the sheaf was neither miserly nor spiteful, for the reason that there is no question of the sheafs having either the merit or demerit of these attributes, since the attributes, like the sheaf, belong to Booz, who exercises the former in disposing of the latter and without informing the latter of his sentiments in the case.

If, however, his sheaf does refer us to Booz, and this is indeed the case, it is because it has replaced him in the signifying chain at the very place where he was to be exalted by the sweeping away of greed and spite. But now Booz himself has been swept away by the sheaf, and hurled into the outer darkness where greed and spite harbor him in the hollow of their negation.

But once *his* sheaf has thus usurped his place, Booz can no longer return there; the slender thread of the little word *his* that binds him to it is only one more obstacle to his return in that it links him to the notion of possession that retains him at the heart of greed and spite. So *his* generosity, affirmed in the passage, is yet reduced to *less than nothing* by the munificence of the sheaf which, coming from nature, knows neither our reserve nor our rejections, and even in its accumulation remains prodigal by our standards.

But if in this profusion the giver has disappeared along with his gift, it is only in order to rise again in what surrounds the figure of speech in which he was annihilated. For it is the figure of the burgeoning of fecundity, and it is this that announces the surprise that the poem celebrates, namely, the promise that the old man will receive in the sacred context of his accession to paternity.

So, it is between the signifier in the form of the proper name of a man and the signifier that metaphorically abolishes him that the poetic spark is produced, and it is in this case all the more effective in realizing the signification of paternity in that it reproduces the mythical event in terms of which Freud reconstructed the progress, in the unconscious of all men, of the paternal mystery.

Modern metaphor has the same structure. So the line *Love is a pebble laughing in the sunlight*, recreates love in a dimension that seems to me most tenable in the face of its imminent lapse into the mirage of narcissistic altruism.

We see, then, that metaphor occurs at the precise point at which sense emerges from non-sense, that is, at that frontier which, as Freud discovered, when crossed the other way produces the word that in French is *the word par excellence*, the word that is simply the signifier "*esprit*"; it is at this frontier that we realize that man defies his very destiny when he derides the signifier.

But to come back to our subject, what does man find in metonymy if not the power to circumvent the obstacles of social censure? Does not this form, which gives its field to truth in its very oppression, manifest a certain servitude inherent in its presentation?...

Of course, as it is said, the letter killeth while the spirit giveth life. We can't help but agree, having had to pay homage elsewhere to a noble victim of the error of seeking the spirit in the letter; but we should also like to know how the spirit could live without the letter. Even so, the pretensions of the spirit would remain unassailable if the letter had not shown us that it produces all the effects of truth in man without involving the spirit at all.

It is none other than Freud who had this revelation, and he called his discovery the unconscious.

The Letter in the Unconscious

In the complete works of Freud, one out of every three pages is devoted to philological references, one out of every two pages to logical inferences, everywhere a

dialectical apprehension of experience, the proportion of analysis of language increasing to the extent that the unconscious is directly concerned.

Thus in "The Interpretation of Dreams" every page deals with what I call the letter of the discourse, in its texture, its usage, its immanence in the matter in question —

The first sentence of the opening chapter announces what for the sake of the exposition could not be postponed: that the dream is a rebus. And Freud goes on to stipulate what I have said from the start, that it must be understood quite literally. This derives from the agency in the dream of that same literal (or phonematic) structure in which the signifier is articulated and analyzed in discourse. So the unnatural images of the boat on the roof, or the man with a comma for a head, which are specifically mentioned by Freud, are examples of dream-images that are to be taken *only* for their value as signifiers, that is to say, in so far as they allow us to spell out the "proverb" presented by the rebus of the dream. The linguistic structure that enables us to read dreams is the very principle of the "significance of the dream," the *Traumdeutung*.

Freud shows us in every possible way that the value of the image as signifier has nothing whatever to do with its signification, giving as an example Egyptian hieroglyphics in which it would be sheer buffoonery to pretend that in a given text the frequency of a vulture, which is an *akph*, or of a chick, which is a *vau*, indicating a form of the verb "to be" or a plural, prove that the text has anything at all to do with these ornithological specimens. Freud finds in this writing certain uses of the signifier that are lost in ours, such as the use of determinatives, where a categorical figure is added to the literal figuration of a verbal term; but this is only to show us that even in this writing, the so-called "ideogram" is a letter.

But it does not require the current confusion on this last term for there to prevail in the minds of psychoanalysts lacking linguistic training the prejudice in favor of a symbolism deriving from natural analogy, or even of the image as appropriate to the instinct. And to such an extent that, outside the French school, which has been alerted, a distinction must be drawn between reading coffee grounds and reading hieroglyphics, by recalling to its own principles a technique that could not be justified were it not directed towards the unconscious.

It must be said that this is admitted only with difficulty and that the mental vice denounced above enjoys such favor that today's psychoanalyst can be expected to say that he decodes before he will come around to taking the necessary tour with Freud (turn as the statue of Champollion, says the guide) that will make him understand that what he does is decipher; the distinction is that a cryptogram takes on its full dimension only when it is in a lost language.

Taking the tour is simply continuing in the *Traumdeutung*.

Entstellung, translated as "distortion" or "transposition," is what Freud shows to be the general precondition for the functioning of the dream, and it is what I designated above, following Saussure, as the sliding of the signified under the signifier, which is always active in discourse (its action, let us note, is unconscious).

But what we call the two "sides" of the effect of the signifier on the signified are also found here.

Verdichtung, or "condensation," is the structure of the superimposition of the signified which metaphor takes as its field, and whose name, condensing in itself the word *Dichtung*, shows how the mechanism is connatural with poetry to the point that it envelops the traditional function proper to poetry.

In the case of *Verschiebung*, "displacement," the German term is closer to the idea of that veering off of signification that we see in metonymy and which from its first appearance in Freud is represented as the most appropriate means used by the unconscious to foil censorship.

What distinguishes these two mechanisms, which play such a privileged role in the dream-work (*Traumarbeit*), from their homologous function in discourse? Nothing, except a condition imposed upon the signifying material, called *Rucksicht auf Darstellbarkeit*, which must be translated by "consideration of the means of representation." (The translation by "role of the possibility of figurative expression" being too approximative here.) But this condition constitutes a limitation operating *within* the system of writing; this is a long way from dissolving the system into a figurative semiology on a level with phenomena of natural expression. This fact could perhaps shed light on the problems involved in certain modes of pictography which, simply because they have been abandoned in writing as imperfect, are not therefore to be regarded as mere evolutionary stages. Let us say, then, that the dream is like the parlor-game in which one is supposed to get the spectators to guess some well-known saying or variant of it solely by dumb-show. That the dream uses speech makes no difference since for the unconscious it is only one among several elements of the representation. It is precisely the fact that both the game and the dream run up against a lack of taxematic material for the representation of such logical articulations as causality, contradiction, hypothesis, etc., that proves they are a form of writing rather than of mine. The subtle processes that the dream is seen to use to represent these logical articulations, in a much less artificial way than games usually employ, are the object of a special study in Freud in which we see once more confirmed that the dream-work follows the laws of the signifier____

That is why any rectification of psychoanalysis must inevitably involve a return to the truth of that discovery, which, taken in its original moment, is impossible to obscure.

For in the analysis of dreams, Freud intends only to give us the laws of the unconscious in their most general extension. One of the reasons why dreams were most propitious for this demonstration is exactly, Freud tells us, that they reveal the same laws whether in the normal person or in the neurotic.

But, in either case, the efficacy of the unconscious does not cease in the waking state. The psychoanalytic experience does nothing other than establish that the unconscious leaves none of our actions outside its field ____

It is a matter, therefore, of defining the topography of this unconscious. I say that it is the very topography defined by the algorithm:

S
s

Is the place that I occupy as the subject of a signifier concentric or excentric, in relation to the place I occupy as subject of the signified? - that is the question.

It is not a question of knowing whether I speak of myself in a way that conforms to what I am, but rather of knowing whether I am the same as that of which I speak. And it is not at all inappropriate to use the word "thought" here. For Freud uses the term to designate the elements involved in the unconscious, that it is the signifying mechanisms that we now recognize as being there.

It is nonetheless true that the philosophical *cogito* is at the center of the mirage that renders modern man so sure of being himself even in his uncertainties about himself, and even in the mistrust he has learned to practice against the traps of self-love.

Furthermore, if, turning the weapon of metonymy against the nostalgia that it serves, I refuse to seek any meaning beyond tautology, if in the name of "war is war" and "a penny is a penny" I decide to be only what I am, how even here can I elude the obvious fact that I am in that very act?

And it is no less true if I take myself to the other, metaphoric pole of the signifying process, and if I dedicate myself to becoming what I am, to coming into being, I cannot doubt that even if I lose myself in the process I am in that process.

Now it is on these very points, where evidence will be subverted by the empirical, that the trick of the Freudian conversion lies.

This signifying game between metonymy and metaphor, up to and including the active edge that splits my desire between a refusal of the signifier and a lack of being, and links my fate to the question of my destiny, this game, in all its inexorable subtlety, is played until the match is called, there where I am not, because I cannot situate myself there.

That is to say, what is needed is more than these words with which, for a brief moment I disconcerted my audience: I think where I am not, therefore I am where I do not think. Words that render sensible to an ear properly attuned with what elusive ambiguity the ring of meaning flees from our grasp along the verbal thread.

What one ought to say is: I am not wherever I am the plaything of my thought, I think of what I am where I do not think to think.

This two-sided mystery is linked to the fact that the truth can be evoked only in that dimension of alibi in which all "realism" in creative works takes its virtue from metonymy; it is likewise linked to this other fact that we acceded to meaning only through the double twist of metaphor when we have the one and only key: the S and the s of the Saussurian algorithm are not only the same level, and man only deludes himself when he believes his true place is at their axis, which is nowhere.

Was nowhere, that is, until Freud discovered it; for if what Freud discovered isn't that, it isn't anything.

The contents of the unconscious with all their disappointing ambiguities give us no reality in the subject more consistent than the immediate; their virtue derives from the truth and in the dimension of being: *Kern unseres Wesen* are Freud's own terms.

The double-triggered mechanism of metaphor is the very mechanism by which the symptom, in the analytic sense, is determined. Between the enigmatic signifier of the sexual trauma and the term that is substituted for it in an actual signifying chain there passes the spark that fixes in a symptom the signification inaccessible to the conscious subject in which that symptom may be resolved - a symptom being a metaphor in which flesh or function is taken as a signifying element.

And the enigmas that desire seems to pose for a "natural philosophy," its frenzy mocking the abyss of the infinite, the secret collusion with which it envelops the pleasure of knowing and of dominating with *jouissance* [sexual pleasure], these amount to no other derangement of instinct than that of being caught in the rails -eternally stretching forth towards the *desire for something else* - metonymy. Hence its "perverse" fixation at the very suspension-point of the signifying chain where the memory-screen is immobilized and the fascinating image of the fetish is petrified.

There is no other way of conceiving the indestructibility of unconscious desire -in the absence of a need which, when forbidden satisfaction, does not sicken and die, even if it means the destruction of the organism itself. It is in a memory, comparable to what is called by that name in our modern thinking-machines (which are in turn based on an electronic realization of the composition of signification), it is in this sort of memory that is found the chain that *insists* on reproducing itself in the transference, and which is the chain of dead desire.

It is the truth of what this desire has been in his history that the patient cries out through his symptom, as Christ said that the stones themselves would have cried out if the children of Israel had not lent them their voice ____

Thus, to speak of the precise point we are treating in my seminars on Freud, little Hans, left in the lurch at the age of five by his symbolic environment, and suddenly forced to face the enigma of his sex and his existence, developed, under the direction of Freud and of his father, Freud's disciple, in mythic form, around the signifying crystal of his phobia, all the permutations possible on a limited number of signifiers.

The operation shows that even on the individual level the solution of the impossible is brought within man's reach by the exhaustion of all possible forms of the impossibilities encountered in solution by recourse to the signifying equation. It is a striking demonstration that illuminates the labyrinth of a case which so far has only been used as a source of demolished fragments. We should be struck too, by the fact that it is in the coextensivity of the development of the symptom and of its curative resolution that the nature of the neurosis is revealed: whether phobic, hysterical, or obsessive, the neurosis is a question that being poses for the subject "from where it was before the subject came into the world" (Freud's phrase, which he used in explaining the Oedipal complex to little Hans).

The "being" referred to is that which appears in a lightning moment in the void of the verb "to be" and I said that it poses its question for the subject. What does that mean? It does not pose it *in front of* the subject, since the subject cannot come to the place where it is posed, but it poses it *in place of* the subject, that is to say, in that place it poses the question *with* the subject, as one poses a problem *with* a pen, or as Aristotle's man thought *with* his soul.

Thus Freud introduced the ego into his doctrine, by defining it according to the resistances that are proper to it. What I have tried to convey is that these resistances are of an imaginary nature much in the same sense as those coaptative lures that the ethology of animal behavior shows us in display or combat, and that these lures are reduced in man to the narcissistic relation introduced by Freud, which I have elaborated in my essay on the mirror stage. I have tried to show that by situating in this ego the synthesis of the perceptual functions in which the sensori-motor selections are integrated, Freud seems to abound in that delegation that is traditionally supposed to represent reality for the ego, and that this reality is all the more included in the suspension of the ego.

For this ego, which is notable in the first instance for the imaginary inertias that it concentrates against the message of the unconscious, operates solely with a view to covering the displacement constituted by the subject with a resistance that is essential to the discourse as such.

That is why an exhaustion of the mechanisms of defense, which Fenichel the practitioner shows us so well in his studies of analytic technique (while his whole reduction on the theoretical level of neuroses and psychoses to genetic anomalies in

libidinal development is pure platitude), manifests itself, without Fenichel's accounting for it or realizing it himself, as simply the reverse side of the mechanisms of the unconscious. Periphrasis, hyperbaton, ellipsis, suspension, anticipation, retraction, negation, digression, irony, these are the figures of style (Quintilian's *figurae sententiarum*); as catachresis, litotes, antonomasia, hypotyposis are the tropes, whose terms suggest themselves as the most proper for the labeling of these mechanisms. Can one really see these as mere figures of speech when it is the figures themselves that are the active principle of the rhetoric of the discourse that the analysand in fact utters?

By persisting in describing the nature of resistance as a permanent emotional state, thus making it alien to the discourse, today's psychoanalysts have simply shown that they have fallen under the blow of one of the fundamental truths that Freud rediscovered through psychoanalysis. One is never happy making way for a new truth, for it always means making our way into it: the truth is always disturbing. We cannot even manage to get used to it. We are used to the real. The truth we repress.

Now it is quite specially necessary to the scientist, to the seer, even to the quack, that he should be the only one to *know*. The idea that deep in the simplest (and even sickest) of souls there is something ready to blossom is bad enough! But if someone seems to know as much as they about what we ought to make of it... then the categories of primitive, prelogical, archaic, or even magic thought, so easy to impute to others, rush to our aid! It is not right that these nonentities keep us breathless with enigmas that prove to be only too unrealizable.

To interpret the unconscious as Freud did, one would have to be as he was, an encyclopedia of the arts and muses, as well as an assiduous reader of the *Fliegende Blätter*. And the task is made no easier by the fact that we are at the mercy of a thread woven with allusions, quotations, puns, and equivocations. And is that our profession, to be antidotes to trifles?

Yet that is what we must resign ourselves to. The unconscious is neither primordial nor instinctual; what it knows about the elementary is no more than the elements of the signifier.

The three books that one might call canonical with regard to the unconscious - *The Interpretation of Dreams*, *The Psychopathology of Everyday Life*, and *Jokes and their Relation to the Unconscious* - are simply a web of examples whose development is inscribed in the formulas of connexion and substitution (though carried to the tenth degree by their particular complexity - diagrams of them are sometimes provided by Freud by way of illustration); these are the formulas we give to the signifier in its *transference-function*. For in *The Interpretation of Dreams* it is in the sense of such a function that the term *Übertragung*, or transference, is introduced, which later gave its name to the mainspring of the intersubjective link between analyst and analysand.

Such diagrams are not only constitutive of each of the symptoms in a neurosis, but they alone make possible the understanding of the thematic of its course and resolution. The great case-histories provided by Freud demonstrate this admirably.

To fall back on a more limited incident, but one more likely to provide us with the final seal on our proposition, let me cite the article on fetishism of 1927, and the case Freud reports there of a patient who, to achieve sexual satisfaction, needed a certain shine on the nose (*Glanz auf der Nase*); analysis showed that his early, English-speaking years had seen the displacement of the burning curiosity that he felt for the phallus of his mother, that is to say, for that eminent *manque-d'être*, for

that lack-of-being, whose privileged signifier Freud revealed to us, into a *glance at the nose* in the forgotten language of his childhood, rather than a *shine on the nose*.

It is the abyss opened up at the thought that a thought should make itself heard in the abyss that provoked resistance to psychoanalysis from the outset. And not, as is commonly said, the emphasis on man's sexuality. This latter has after all been the dominant object in literature throughout the ages. And in fact the more recent evolution of psychoanalysis has succeeded by a bit of comical legerdemain in turning it into a quite moral affair, the cradle and trysting-place of oblativity and attraction. The Platonic setting of the soul, blessed and illuminated, rises straight to paradise.

The intolerable scandal in the time before Freudian sexuality was sanctified was that it was so "intellectual." It was precisely in that that it showed itself to be the worthy ally of all those terrorists whose plottings were going to ruin society.

At a time when psychoanalysts are busy remodeling psychoanalysis into a right-thinking movement whose crowning expression is the sociological poem of the *autonomous ego*, I would like to say, to all those who are listening to me, how they can recognize bad psychoanalysis; this is by the word they use to deprecate all technical or theoretical research that carried forward the Freudian experience along its authentic lines. That word is "*intellectualization*" - execrable to all those who, living in fear of being tried and found wanting by the wine of truth, spit on the bread of men, although their slaver can no longer have any effect other than that leavening _____

The end that Freud's discovery proposes for man was defined by him at the apex of his thought in these moving terms: *Wo es war, soll Ich werden*. *Es* refers to the id or the unconscious, so this means "where the unconscious was, consciousness shall go." I must come to the place where that was.

This is one of reintegration and harmony, I could even say of reconciliation (*Versöhnung*).

But if we ignore the self's radical excentricity to itself with which man is confronted, in other words, the truth discovered by Freud, we shall falsify both the order and methods of psychoanalytic mediation.

Notes

- 1 "A la lettre" [Trans.]
- 2 To which verbal hallucination, when it takes this form, opens a communicating door with the Freudian structure of psychosis - a door until now unnoticed.
- 3 I spoke in my seminar of June 6, 1956 of the first scene of *Athalie*, incited by an allusion -tossed off by a highbrow critic in the *New Statesman and Nation* - to the "high whoredom" of Racine's heroines, to renounce reference to the savage dramas of Shakespeare, which have become compulsional in analytic circles where they play the role of status-symbol for the Philistines.
- 4 The publication by Jean Starobinski, in *Le Mercure de France* (February 1964) of Saussure's notes on anagrams and their hypogrammatical use, from the Saturnine verses to the writings of Cicero, provide the corroboration that I then lacked (note 1966).
- 5 "Non! dit l'Arbre, il dit: Non! dans l'éclat d'un instant sa tête superbe / Que la tempête traite universellement / Comme elle fait une herbe." (Paul Valéry, "Au Platane," *Les Charmes*).
- 6 I pay homage here to the works of Roman Jakobson - to which I owe much of this formulation; works to which a psychoanalyst can constantly refer in order to structure his own experience, and which render superfluous the "personal communications" of which I could boast as much as the next fellow.

Indeed, one recognizes in this oblique form of allegiance the style of that immortal couple, Rosencrantz and Guildenstern, who are virtually indistinguishable, even in the imperfection of their destiny, for it survives by the same method as Jeannot's knife, and for the same reason for which Goethe praised Shakespeare for presenting the character in double form: they represent, in themselves alone, the whole *Gesellschaft*, the Association itself (*Wilhelm Meisters Lehrjahre*, ed. Trunz, Christian Wegner Verlag, Hamburg, v (5): 299) - I mean the International Psychoanalytical Association.

We should savor the passage from Goethe as a whole: "*Dieses leise Auftreten dieses Schmiegen und Biegen, dies Jasagen, Streicheln und Schmeicheln, dieses Behendigkeit, dies Schwdnzein, diese Allheit und Leerheit, diese rechtliche Schurkerei, diese Unfdhigkeit, wie kann sie durch einen Menschen ausgedruckt werden? Es sollten ihrer wenigstens ein Dutzend sein, wenn man sie haben kbnnnte, denn sie Moss in Gesellschaft etwas, sie sind die Gesellschaft...*"

Let us thank also, in this context, the author R. M. Loewenstein of "Some Remarks on the Role of Speech in Psychoanalytic Technique" (*J. P.*, Nov.-Dec, 1956, XXXVII (6): 467) for taking the trouble to point out that his remarks are "based on" work dating from 1952. This is no doubt the explanation for the fact that he has learned nothing from work done since then, yet which he is not ignorant of, as he cites me as their "editor" (*sic*).

7 "Sa gerbe n'etait pas avare ni haineuse," a line from "Boozendormi." [Trans.]

8 "*Mot*," in the broad sense, means "word." In the narrower sense, however, it means "a witticism." The French "*esprit*" is translated, in this context, as "wit," the equivalent of Freud's *Witz*. [Trans.]

"*Esprit*" is certainly the equivalent of the German *Witz* with which Freud marked the approach of his third fundamental work on the unconscious. The much greater difficulty of finding this equivalent in English is instructive: "wit," burdened with all the discussion of which it was the object from Davenant and Abbes to Pope and Addison, abandoned its essential virtues to "humor," which is something else. There only remains the "pun," but this word is too narrow in its connotation.

9 This and the next paragraph were rewritten solely with a view to greater clarity of expression (note 1968).

10 *Fetischismus*, G. W. XIV, p. 311; "Fetishism," *Collected Papers*, V, p. 198; *Standard Edition* XXI, p. 149.

The Negro and Psychopathology

Frantz Fanon

Frantz Fanon's brief but remarkable life was marked by the publication of several important books, including *The Wretched of the Earth* (1961) and *Black Skin White Masks* (1952), from which this selection is taken. Trained in medicine and psychiatry, he devoted himself to the cause of the Algerian revolution against French colonialism. His thinking brings together insights into psychology and a concern for the effects of domination on subjugated peoples.

Psychoanalytic schools have studied the neurotic reactions that arise among certain groups, in certain areas of civilization. In response to the requirements of dialectic, one should investigate the extent to which the conclusions of Freud or of Adler can be applied to the effort to understand the man of color's view of the world.

It can never be sufficiently emphasized that psychoanalysis sets as its task the understanding of given behavior patterns - within the specific group represented by the family. When the problem is a neurosis experienced by an adult, the analyst's task is to uncover in the new psychic structure an analogy with certain infantile elements, a repetition, a duplication of conflicts that owe their origin to the essence of the family constellation. In every case the analyst clings to the concept of the family as a "psychic circumstance and object."

Here, however, the evidence is going to be particularly complicated. In Europe the family represents in effect a certain fashion in which the world presents itself to the child. There are close connections between the structure of the family and the structure of the nation. Militarization and the centralization of authority in a country automatically entail a resurgence of the authority of the father. In Europe and in every country characterized as civilized or civilizing, the family is a miniature of the nation. As the child emerges from the shadow of his parents, he finds himself once more among the same laws, the same principles, the same values. A normal child that has grown up in a normal family will be a normal man. There is no disproportion between the life of the family and the life of the nation. Conversely, when one examines a closed society - that is, a society that has been protected from the flood of civilization - one encounters the same structures as those just described. Father Trilles' *L'dme du Pygmee d'Afrique*, for instance, convinces us of that; although with every word one is aware of the need to Christianize the savage Negro soul, the book's description of the whole culture - the conditions of worship, the persistence of rites, the survival of myths - has nothing of the artificial impression given by *La philosophic bantoue*.

In both cases the characteristics of the family are projected onto the social environment. It is true that the children of pickpockets or burglars, accustomed to a certain

system of clan law, would be surprised to find that the rest of the world behaved differently, but a new kind of training - except in instances of perversion or arrested development (Heuyer)³ - should be able to direct them into a moralization, a socialization of outlook.

It is apparent in all such cases that the sickness lies in the family environment.

For the individual the authority of the state is a reproduction of the authority of the family by which he was shaped in his childhood. Ultimately the individual assimilates all the authorities that he meets to the authority of the parents: He perceives the present in terms of the past. Like all other human conduct, behavior toward authority is something learned. And it is learned in the heart of a family that can be described, from the psychological point of view, by the form of organization peculiar to it - that is, by the way in which its authority is distributed and exercised.⁴

But - and this is a most important point - we observe the opposite in the man of color. A normal Negro child, having grown up within a normal family, will become abnormal on the slightest contact with the white world. This statement may not be immediately understandable. Therefore let us proceed by going backward. Paying tribute to Dr. Breuer, Freud wrote:

In almost every case, we could see that the symptoms were, so to speak, like residues of emotional experiences, to which for this reason we later gave the name of psychic traumas. Their individual characters were linked to the traumatic scenes that had provoked them. According to the classic terminology, the symptoms were determined by "scenes" of which they were the mnemonic residues, and it was no longer necessary to regard them as arbitrary and enigmatic effects of the neurosis. In contrast, however, to what was expected, it was not always a single event that was the cause of the symptom; most often, on the contrary, it arose out of multiple traumas, frequently analogous and repeated. As a result, it became necessary to reproduce chronologically this whole series of pathogenic memories, but in reverse order: the latest at the beginning and the earliest at the end; it was impossible to make one's way back to the first trauma, which is often the most forceful, if one skipped any of its successors.

It could not be stated more positively; every neurosis has its origins in specific *Erlebnisse* [experiences]. Later Freud added:

This trauma, it is true, has been quite expelled from the consciousness and the memory of the patient and as a result he has apparently been saved from a great mass of suffering, but the repressed desire continues to exist in the unconscious; it is on watch constantly for an opportunity to make itself known and it soon comes back into consciousness, but in a disguise that makes it impossible to recognize; in other words, the repressed thought is replaced in consciousness by another that acts as its surrogate, its *Ersatz*, and that soon surrounds itself with all those feelings of morbidity that had been supposedly averted by the repression.

These *Erlebnisse* are repressed in the unconscious.

What do we see in the case of the black man? Unless we make use of that frightening postulate - which so destroys our balance - offered by Jung, the *collective unconscious*, we can understand absolutely nothing. A drama is enacted every day in colonized countries. How is one to explain, for example, that a Negro who has passed

his baccalaureate and has gone to the Sorbonne to study to become a teacher of philosophy is already on guard before any conflictual elements have coalesced round him? Rene Menil accounted for this reaction in Hegelian terms. In his view it was "the consequence of the replacement of the repressed [African] spirit in the consciousness of the slave by an authority symbol representing the Master, a symbol implanted in the subsoil of the collective group and charged with maintaining order in it as a garrison controls a conquered city."

We shall see in our section on Hegel that Rene Menil has made no misjudgment. Meanwhile we have the right to put a question to ourselves: How is the persistence of this reaction in the twentieth century to be explained when in other ways there is complete identification with the white man? Very often the Negro who becomes abnormal has never had any relations with whites. Has some remote experience been repressed in his unconscious? Did the little black child see his father beaten or lynched by a white man? Has there been a real traumatism? To all of this we have to answer *no*. Well, then?

If we want to answer correctly, we have to fall back on the idea of *collective catharsis*. In every society, in every collectivity, exists - must exist - a channel, an outlet through which the forces accumulated in the form of aggression can be released. This is the purpose of games in children's institutions, of psychodramas in group therapy, and, in a more general way, of illustrated magazines for children - each type of society, of course, requiring its own specific kind of catharsis. The Tarzan stories, the sagas of twelve-year-old explorers, the adventures of Mickey Mouse, and all those "comic books" serve actually as a release for collective aggression. The magazines are put together by white men for little white men. This is the heart of the problem. In the Antilles - and there is every reason to think that the situation is the same in the other colonies - these same magazines are devoured by the local children. In the magazines the Wolf, the Devil, the Evil Spirit, the Bad Man, the Savage are always symbolized by Negroes or Indians; since there is always identification with the victor, the little Negro, quite as easily as the little white boy, becomes an explorer, an adventurer, a missionary "who faces the danger of being eaten by the wicked Negroes." I shall be told that this is hardly important; but only because those who say it have not given much thought to the role of such magazines. Here is what G. Legman thinks of them:

With very rare exceptions, every American child who was six years old in 1938 had therefore assimilated at the very least 18,000 scenes of ferocious tortures and bloody violence __ Except the Boers, the Americans are the only modern nation that within living memory has completely driven the autochthonous population off the soil that it had occupied. America alone, then, could have had an uneasy national conscience to lull by creating the myth of the "Bad Injun,"⁷ in order later to be able to bring back the historic figure of the Noble Redskin vainly defending his lands against invaders armed with rifles and Bibles; the punishment that we deserve can be averted only by denying responsibility for the wrong and throwing the blame on the victim; by proving - at least to our own satisfaction - that by striking the first and only blow we were acting solely on the legitimate ground of defense __ [Anticipating the repercussions of these magazines on American culture, Legman went on:] There is still no answer to the question whether this maniacal fixation on violence and death is the substitute for a forbidden sexuality or whether it does not rather serve the purpose of channeling, along a line left open by sexual censorship, both the child's and the adult's desire for aggression against

the economic and social structure which, though with their entire consent, perverts them. In both cases the root of the perversion, whether it be of a sexual or of an economic character, is of the essence; that is why, as long as we remain incapable of attacking these fundamental repressions, every attack aimed at such simple escape devices as comic books will remain futile.

The black schoolboy in the Antilles, who in his lessons is forever talking about "our ancestors, the Gauls," identifies himself with the explorer, the bringer of civilization, the white man who carries truth to savages - an all-white truth. There is identification - that is, the young Negro subjectively adopts a white man's attitude. He invests the hero, who is white, with all his own aggression - at that age closely linked to sacrificial dedication, a sacrificial dedication permeated with sadism. An eight-year-old child who offers a gift, even to an adult, cannot endure a refusal. Little by little, one can observe in the young Antillean the formation and crystallization of an attitude and a way of thinking and seeing that are essentially white. When in school he has to read stories of savages told by white men, he always thinks of the Senegalese. As a schoolboy, I had many occasions to spend whole hours talking about the supposed customs of the savage Senegalese. In what was said there was a lack of awareness that was at the very least paradoxical. Because the Antillean does not think of himself as a black man; he thinks of himself as an Antillean. The Negro lives in Africa. Subjectively, intellectually, the Antillean conducts himself like a white man. But he is a Negro. That he will learn once he goes to Europe; and when he hears Negroes mentioned he will recognize that the word includes himself as well as the Senegalese. What are we to conclude on this matter?

To impose the same "Evil Spirits" on the white man and on the black man is a major error in education. If one is willing to understand the "Evil Spirit" in the sense of an attempt to personify the *id*, the point of view will be understood. If we are utterly honest, we must say that children's counting-out rhymes are subject to the same criticism. It will have already been noticed that I should like nothing more nor less than the establishment of children's magazines especially for Negroes, the creation of songs for Negro children, and, ultimately, the publication of history texts especially for them, at least through the grammar-school grades. For, until there is evidence to the contrary, I believe that if there is a traumatism it occurs during those years. The young Antillean is a Frenchman called on at all times to live with white compatriots. One forgets this rather too often.

The white family is the agent of a certain system. The society is indeed the sum of all the families in it. The family is an institution that prefigures a broader institution: the social or the national group. Both turn on the same axes. The white family is the workshop in which one is shaped and trained for life in society. "The family structure is internalized in the superego," Marcus says, "and projected into political [though I would say social] behavior."

As long as he remains among his own people, the little black follows very nearly the same course as the little white. But if he goes to Europe, he will have to reappraise his lot. For the Negro in France, which is his country, will feel different from other people. One can hear the glib remark: The Negro makes himself inferior. But the truth is that he is made inferior. The young Antillean is a Frenchman called

upon constantly to live with white compatriots. Now, the Antillean family has for all practical purposes no connection with the national - that is, the French, or European - structure. The Antillean has therefore to choose between his family and European society; in other words, the individual who *climbs up* into society - white and civilized - tends to reject his family - black and savage - on the plane of imagination, in accord with the childhood *Erlebnisse* that we discussed earlier. In this case the schema of Marcus becomes

Family <— Individual —* Society

and the family structure is cast back into the *id*.

The Negro recognizes the unreality of many of the beliefs that he has adopted with reference to the subjective attitude of the white man. When he does, his real apprenticeship begins. And reality proves to be extremely resistant. But, it will be objected, you are merely describing a universal phenomenon, the criterion of maturity being in fact adaptation to society. My answer is that such a criticism goes off in the wrong direction, for I have just shown that for the Negro there is a myth to be faced. A solidly established myth. The Negro is unaware of it as long as his existence is limited to his own environment; but the first encounter with a white man oppresses him with the whole weight of his blackness.

Then there is the unconscious. Since the racial drama is played out in the open, the black man has no time to "make it unconscious." The white man, on the other hand, succeeds in doing so to a certain extent, because a new element appears: guilt. The Negro's inferiority or superiority complex or his feeling of equality is *conscious*. These feelings forever chill him. They make his drama. In him there is none of the affective amnesia characteristic of the typical neurotic.

Whenever I have read a psychoanalytic work, discussed problems with my professors, or talked with European patients, I have been struck by the disparity between the corresponding schemas and the reality that the Negro presents. It has led me progressively to the conclusion that there is a dialectical substitution when one goes from the psychology of the white man to that of the black.

The earliest values, which Charles Odier describes, are different in the white man and in the black man. The drive toward socialization does not stem from the same motivations. In cold actuality, we change worlds. A close study should be divided into two parts:

- 1 a psychoanalytic interpretation of the life experience of the black man;
- 2 a psychoanalytic interpretation of the Negro myth.

But reality, which is our only recourse, prevents such procedures. The facts are much more complicated. What are they?

The Negro is a phobogenic object, a stimulus to anxiety. From the patient treated by Serieux and Capgras¹² to the girl who confides to me that to go to bed with a Negro would be terrifying to her, one discovers all the stages of what I shall call the Negro-phobogenesis. There has been much talk of psychoanalysis in connection with the Negro. Distrusting the ways in which it might be applied, I have preferred to call this chapter "The Negro and Psychopathology," well aware that Freud and Adler and even the cosmic Jung did not think of the Negro in all their investigations.

And they were quite right not to have. It is too often forgotten that neurosis is not a basic element of human reality. Like it or not, the Oedipus complex is far from coming into being among Negroes. It might be argued, as Malinowski contends, that the matriarchal structure is the only reason for its absence. But, putting aside the question whether the ethnologists are not so imbued with the complexes of their own civilization that they are compelled to try to find them duplicated in the peoples they study, it would be relatively easy for me to show that in the French Antilles 97 percent of the families cannot produce one Oedipal neurosis. This incapacity is one on which we heartily congratulate ourselves.¹⁴

With the exception of a few misfits within the closed environment, we can say that every neurosis, every abnormal manifestation, every affective erethism in an Antillean is the product of his cultural situation. In other words, there is a constellation of postulates, a series of propositions that slowly and subtly - with the help of books, newspapers, schools and their texts, advertisements, films, radio - work their way into one's mind and shape one's view of the world of the group to which one belongs. In the Antilles that view of the world is white because no black voice exists. The folklore of Martinique is meager, and few children in Fort-de-France know the stories of "Compe Lapin," twin brother of the Br'er Rabbit of Louisiana's Uncle Remus. A European familiar with the current trends of Negro poetry, for example, would be amazed to learn that as late as 1940 no Antillean found it possible to think of himself as a Negro. It was only with the appearance of Aime Cesaire that the acceptance of negritude and the statement of its claims began to be perceptible. The most concrete proof of this, furthermore, is that feeling which pervades each new generation of students arriving in Paris: It takes them several weeks to recognize that contact with Europe compels them to face a certain number of problems that until their arrival had never touched them. And yet these problems were by no means invisible.

Whenever I had a discussion with my professors or talked with European patients, I became aware of the differences that might prevail between the two worlds. Talking recently to a physician who had always practiced in Fort-de-France, I told him what conclusions I had arrived at; he went farther, saying that they were valid not only in psychopathology but also in general medicine. "In the same way," he added, "you never encounter a case of pure typhoid such as you studied in the textbooks; there is always a more or less manifest complication of malaria." It would be interesting to study, for example, a case of schizophrenia as experienced by a Negro - if indeed that kind of malady were to be found there.

What am I getting at? Quite simply this: When the Negro makes contact with the white world, a certain sensitizing action takes place. If his psychic structure is weak, one observes a collapse of the ego. The black man stops behaving as an *actional* person. The goal of his behavior will be The Other (in the guise of the white man), for The Other alone can give him worth. That is on the ethical level: self-esteem.

Notes

- 1 Jacques Lacan, "Le complexe, facteur concret de la psychologie familiale," *Encyclopedic française*, 8-40, 5.

- 2 I should like to think that I am not going to be brought to trial for this sentence. Skeptics always have a fine time asking, "What do you mean by *normal*?" For the moment, it is beyond the scope of this book to answer the question. In order to pacify the more insistent, let me refer them to the extremely instructive work by Georges Canguilhem, *Essai sur quelques problèmes concernant le normal et le pathologique* (Paris: Societe d'Editions, 1950), even though its sole orientation is biological. And let me add only that in the psychological sphere the abnormal man is he who demands, who appeals, who begs.
- 3 Although even this reservation is open to argument. See for example the question put by Mile. Juliette Boutonnier: "Might not perversion be an extreme arrest in affect development, furthered, if not produced, by the conditions under which the child has lived, at least as much as by the congenital tendencies that are obviously factors in it but that probably are not alone responsible?" (*Revue Française de Psychanalyse*, no. 3, 1949, pp. 403-4.)

- 9 One always sees a smile when one reports this aspect of education in Martinique. The smile comes because the comicality of the thing is obvious, but no one pursues it to its later consequences. Yet these are the important aspects, because three or four such phrases are the basis on which the young Antillean works out his view of the world.
- 10 In this connection it is worth remembering what Sartre said:

Some children, at the age of five or six, have already had fights with schoolmates who call them "Yids." Others may remain in ignorance for a long time. A young Jewish girl in a family I am acquainted with did not even know the meaning of the word *Ji?K* until she was fifteen. During the Occupation there was a Jewish doctor who lived shut up in his home at Fontainebleau and raised his children without saying a word to them of their origin. But however it comes about, some day they must learn the truth: sometimes from the smiles of those around them, sometimes from rumor or insult. The later the discovery, the more violent the shock. Suddenly they perceive that others know something about them that they do not know, that people apply to them an ugly and upsetting term that is not used in their own families. (*Anti-Semite and Jew*, p. 75)

- 11 *Les deux sources consciente et inconsciente de la vie morale* (Neuchatel: La Baconnière, 1943).
- 12 *Les folies raisonnantes*, cited by A. Hesnard, *L'univers morbide de la faute* (Paris: Presses Universitaires de France, 1949), p. 97.
- 13 I am thinking here particularly of the United States. See, for example, *Home of the Brave*.
- 14 On this point psychoanalysts will be reluctant to share my view. Dr. Lacan, for instance, talks of the "abundance" of the Oedipus complex. But even if the young boy has to kill his father, it is still necessary for the father to accept being killed. I am reminded of what Hegel said: "The cradle of the child is the tomb of the parents"; and of Nicolas Galas' *Foyer d'incendie* and of Jean Lacroix' *Force et faiblesses de la famille*. The collapse of moral values in France after the war was perhaps the result of the defeat of that moral being which the nation represented. We know what such traumatism on the family level may produce.
- 15 I recommend the following experiment to those who are unconvinced: Attend showings of a Tarzan film in the Antilles and in Europe. In the Antilles, the young Negro identifies himself *de facto* with Tarzan against the Negroes. This is much more difficult for him in a European theater, for the rest of the audience, which is white, automatically identifies him with the savages on the screen. It is a conclusive experience. The Negro learns that one is not black without problems. A documentary film on Africa produces similar reactions when it is shown in a French city and in Fort-de-France. I will go farther and say that Bushmen and Zulus

arouse even more laughter among the young Antilleans. It would be interesting to show how in this instance the reactional exaggeration betrays a hint of recognition. In France a Negro who sees this documentary is virtually petrified. There he has no more hope of flight: He is at once Antillean, Bushman, and Zulu. 16 More especially, they become aware that the line of self-esteem that they had chosen should be inverted. We have seen in fact that the Antillean who goes to France pictures this journey as the final stage of his personality. Quite literally I can say without any risk of error that the Antillean who goes to France in order to convince himself that he is white will find his real face there.

Pre-Oedipal Gender Configurations

Nancy Chodorow

Nancy Chodorow's *The Reproduction of Mothering* (1978) was an influential work of feminist psychoanalysis. In it, Chodorow examines the differing ways that boys and girls grow up and respond to the traditional family situation. Chodorow argues for the importance of the "pre-Oedipal" stage of development when children are more likely to be under a mother's care.

We knew, of course, that there had been a preliminary stage of attachment to the mother, but we did not know that it could be so rich in content and so long-lasting, and could leave behind so many opportunities or fixations and dispositions. During this time the girl's father is only a troublesome rival; in some cases the attachment to her mother lasts beyond the fourth year of life. Almost everything that we find later in her relation to her father was already present in this earlier attachment and has been transferred subsequently on to her father. In short, we get an impression that we cannot understand women unless we appreciate this phase of their pre-Oedipal attachment to their mother.

FREUD, "Femininity"

Our insight into this early pre-Oedipal phase in girls comes to us as a surprise, like the discovery, in another field, of the Minoan-Mycenaean civilization behind the civilization of Greece.

FREUD, "Female Sexuality"

Family structure produces crucial differentiating experiences between the sexes in oedipal object-relations and in the way these are psychologically appropriated, internalized, and transformed. Mothers are and have been the child's primary caretaker, socializer, and inner object; fathers are secondary objects for boys and girls. My interpretation of the Oedipus complex, from a perspective centered on object-relations, shows that these basic features of family structure entail varied modes of differentiation for the ego and its internalized object-relations and lead to the development of different relational capacities for girls and boys.

The feminine Oedipus complex is not simply a transfer of affection from mother to father and a giving up of mother. Rather, psychoanalytic research demonstrates

the continued importance of a girl's external and internal relation to her mother, and the way her relation to her father is added to this. This process entails a relational complexity in feminine self-definition and personality which is not characteristic of masculine self-definition or personality. Relational capacities that are curtailed in boys as a result of the masculine Oedipus complex are sustained in girls.

Because of their mothering by women, girls come to experience themselves as less separate than boys, as having more permeable ego boundaries. Girls come to define themselves more in relation to others. Their internalized object-relational structure becomes more complex, with more ongoing issues. These personality features are reflected in superego development.

My investigation, then, does not focus on issues at the center of the traditional psychoanalytic account of the Oedipus complex - superego formation, gender identity, the attainment of gender role expectations, differential valuations of the sexes, and the genesis of sexual orientation. It takes other issues as equally central. I will be concerned with traditional issues only insofar as my analysis of Oedipal object-relations of boys and girls sheds new insight on the different nature of male and female heterosexual object-relations.

My interpretation of the feminine Oedipus complex relies for the most part on the early psychoanalytic account of female development. Aspects of this account of female psychology, sexuality, and development have been criticized and shown to be inaccurate or limited. However, those elements of it which I emphasize - the clinically derived description and interpretation of experienced female object-relations in a nuclear family in which women mother and fathers are more remote figures to the children - have not been subjected to substantial revision within the psychoanalytic tradition nor criticism from without, and remain valid.

Early Psychoanalytic Formulations

Freud's account of the boy's Oedipus complex is relatively simple and straightforward.² In response to, or in collaboration with, his heterosexual mother, a boy's pre-oedipal attachment to her becomes charged with phallic/sexual overtones. He comes to see his father as a rival for his mother's love and wishes to replace him. He fantasizes taking his father's penis, murdering or castrating him. He fears retaliation, and specifically castration, by his father for these wishes; thus he experiences a conflict between his self-love (narcissistic interest in his penis and body integrity) and his love for his mother (libidinal cathexis). As a result, he gives up his heterosexual attachment to his mother, radically repressing and denying his feelings toward her. (These feelings are not only repressed, but also are partly expressed in "aim-inhibited" modes, in affectionate feelings and sublimated activities.) At the same time, a "successful" resolution of his Oedipus complex requires that he remain heterosexual. Therefore, he is supposed to detach his heterosexual orientation from his mother, so that when he grows up he can reattach it to some other woman.

He receives a reward for his self-sacrifice, in addition to his avoidance of punishment. The carrot of the masculine Oedipus complex is identification with his father,

My reading of this account, however, as a description and interpretation of family structure and its effects in male-dominant industrial capitalist society would not be accepted by all psychoanalysts.

and the superiority of masculine identification and prerogatives over feminine (if the threat of castration is the stick). A new psychic integration appears in place of the Oedipus complex, as the boy's ego is modified and transformed through the incorporation of paternal prohibitions to form his superego, and as he substitutes a general sexual orientation for the specific attachment to his mother (this attachment is composed of both the remainders of his infantile love and his newer sexualized and genitalized attachment).

Freud originally believed that the object-relational configurations of the feminine and masculine Oedipus complexes were completely symmetrical. According to this view, little girls at around age three, and as genital component drives become important, discover that they do not have a penis. They automatically think they are castrated and inferior, and experience their lack as a wound to their self-esteem (a narcissistic wound). As Freud says, they "fall a victim to envy for the penis." They also develop contempt for others, like their mother, who do not have penises and at the same time blame her for their own atrophied state. This contempt, plus their anger at her, leads them to turn away in anger and hostility from their mother, who has been their first love object. They turn to their father, who has a penis and might provide them with this much desired appendage. They give up a previously active sexuality for passive sexuality in relation to him. Finally, they change from wanting a penis from their father to wanting a child from him, through an unconscious symbolic equation of penis and child.

At the same time, their mother becomes a rival because she has sexual access to and possession of their father. The female Oedipus complex appears only when the mother has become a rival and the father a desired object. It consists in love for the father and rivalry with the mother, and is symmetrically opposed to the male Oedipus complex. Heterosexual orientation is thus an Oedipal outcome for girls as well as for boys. (Freud also speaks to differences in Oedipal outcome — the girl does not need to give up her Oedipus stance in the same manner as the boy, since she no longer has castration to fear.)

The Discovery of the Pre-Oedipal Mother-Daughter Relationship

Jeanne Lampl-de Groot described two clinical examples of a "negative Oedipus complex" in girls, in which they cathected their mothers and saw their fathers as rivals. This fundamentally disrupted Freud's original postulation of Oedipal symmetry. Analysts continued to hold to much of Freud's original account, but Lampl-de Groot's discovery also substantially modified views of feminine Oedipal object-relations, and turned attention to the unique qualities of the pre-Oedipal mother-daughter relationship.

In Freud's original view, a daughter sees her mother only as someone who deprives her first of milk, then of sexual gratification, finally of a penis. A mother is seen as initiating only rivalry and hostility. In the light of Lampl-de Groot's finding, Freud reviewed his own clinical experience. He came to agree with her that the pre-

Freud is especially interested in the implication of this difference for feminine superego formation, but his account is not directly relevant here. Further on I examine the biases inherent in his formulation and some of its logical and clinical contradictions.

Oedipal phase was central in feminine development, that daughters, just as sons, begin life attached exclusively to their mothers.⁶ Children were not originally bisexual, though they were potentially so. They were, rather, gynosexual, or matrisexual.

The discovery of the pre-Oedipal mother-daughter relationship required a general reformulation of psychoanalytic theory and its understanding of the development of object-relations. Freud had claimed that the Oedipus complex was the nucleus of neurosis and the basis of personality formation, and he was now led to revise radically this claim. Freud compares his new insight into the pre-Oedipal phase of feminine development to a similarly layered historical discovery. Just as the Minoan-Mycenaean civilization underlies and explains the origins and form of classical Greece, so the pre-Oedipal phase in girls underlies and explains the origins and form of the feminine Oedipus complex.

Freud points to three major features of a girl's pre-Oedipal phase and her relationship to her mother during this phase. First, her pre-Oedipal attachment to her mother lasts through all three periods of infantile sexuality, often well into her fourth or fifth year. Second, this attachment is dramatically intense and ambivalent. Finally, Freud reports a surprising finding from his analysis of women with a strong attachment to their father: This strong attachment has been preceded by an equally strong and passionate attachment to their mother. More generally, he finds that a woman's pre-Oedipal attachment to her mother largely determines both her subsequent Oedipal attachment to her father and her later relationship to men in general.

A girl's pre-Oedipal relationship to her mother and her entrance into the Oedipus situation contrast to those of a boy. Freud and Brunswick claim that a boy's phase of pre-Oedipal mother-attachment is much shorter than a girl's, that he moves earlier into an Oedipal attachment. What this means is not immediately apparent. If a girl retains a long pre-Oedipal attachment to her mother, and if a boy's Oedipal attachment is to his mother, then both boy and girl remain attached to their mother throughout the period of childhood sexuality. Brunswick suggests further that both boy and girl pass from a period of "passive" attachment to their mother to one of "active" attachment to her. On one level, then, it looks as though both boy and girl maintain similar attachments to their mother, their first love object, throughout most of their early years.

On another level, however, these attachments to the mother are very different -the retention of dichotomous formulations is necessary. On the basis of Freud's account and a later more extended discussion by Helene Deutsch in the *Psychology of Women*, one can argue that the *nature* of the attachment is different. A boy's relation to his mother soon becomes focused on competitive issues of possession and phallic-sexual oppositeness (or complementarity) to her. The relation becomes embedded in triangular conflict as a boy becomes preoccupied with his father as a rival. A girl, by contrast, remains preoccupied for a long time with her mother alone. She experiences a continuation of the two-person relationship of infancy. Playing with dolls during this period, for instance, not only expresses "the *active* side of [the girl's] femininity"

Since that time, major contributions to the theory of development have been concerned much more with the pre-Oedipal years - the early mother-infant relationship and early infantile development. Few analysts now hold that the Oedipus complex is the *nucleus* of neurosis, though they might say it contributes to its final *form*.

but also "is probably evidence of the exclusiveness of her attachment to her mother, with complete neglect of her father-object."

The issue here is the father as an internal object, or object of conflict and ambivalence __ Fathers often become external attachment figures for children of both genders during their pre-Oedipal years. But the intensity and exclusivity of the relationship is much less than with a mother, and fathers are from the outset separate people and "special." As a result, representations of the father relationship do not become so internalized and subject to ambivalence, repression, and splitting of good and bad aspects, nor so determining of the person's identity and sense of self, as do representations of the relationship to a mother. As a boy moves into Oedipal attachment and phallic-possessive competition, and as he tries to consolidate his masculine identity, his father does become an object of his ambivalence. At this time, the girl's intense ambivalent attachment remains with her mother.

The content of a girl's attachment to her mother differs from a boy's precisely in that it is not at this time Oedipal (sexualized, focused on possession, which means focused on someone clearly different and opposite). The pre-Oedipal attachment of daughter to mother continues to be concerned with early mother-infant relational issues. It sustains the mother-infant exclusivity and the intensity, ambivalence, and boundary confusion of the child still preoccupied with issues of dependence and individuation. By contrast, the boy's "active attachment" to his mother expresses his sense of difference from and masculine oppositeness to her, in addition to being embedded in the Oedipal triangle. It helps him to differentiate himself from his mother, and his mother from his father.

The use of two different concepts for the early relationship between mother and daughter (mother-infant relationship, with reference to issues of development; pre-Oedipal, with reference to the girl's relation to her mother) obscures the convergence of the two processes. The terminological distinction is an artifact of the emergence of different aspects of psychoanalytic theory at different times ("pre-Oedipal" emerged early in investigating the feminine Oedipus complex; "mother-infant relationship" emerged later, as research focused on the early developmental stage as a distinct period).

There is analytic agreement that the pre-Oedipal period is of different length in girls and boys. There is also an agreed on, if undeveloped, formulation concerning those gender differences in the nature and quality of the pre-Oedipal mother-child relationship I have been discussing. This claim stands as an empirical finding with substantial descriptive and interpretive clinical support. The implications of these early developmental tendencies for psychological gender differences also stand on their own (Freud's claim that the early attachment to her mother affects a girl's attachment to her father and men, for instance). But Freud and his colleagues do not explain how such differences come about.

The different length and quality of the pre-Oedipal period in boys and girls are rooted in women's mothering, specifically in the fact that a mother is of the same gender as her daughter and of a different gender from her son. This leads to her experiencing and treating them differently. I do not mean this as a biological claim. I am using *gender* here to stand for the mother's particular psychic structure and relational sense, for her (probable) heterosexuality, and for her conscious and unconscious acceptance of the ideology, meanings, and expectations that go into being a gendered member of our society and understanding what gender means. Being a

grown woman and mother also means having been the daughter of a mother, which affects the nature of her motherliness and quality of her mothering.

It is not easy to prove that mothers treat and experience differently pre-Oedipal boys and girls. Maccoby and Jacklin, in the currently definitive review of the observational and experimental literature of psychology on sex differences, claim that the behavioral evidence - based on interviews of parents and observations of social science researchers - indicates little differential treatment. They report that most studies of children in the first four or five years concerning parent-child interaction, parental warmth, reaction to dependence or independence, and amount of praise and positive feedback show no difference according to the gender of the child. They also report no gender difference in proximity-seeking, touching, and resistance to separation from parents or caretakers in young children. These studies measure observable behaviors, which can be coded, counted and replicated, and they take for proof of gender difference only statistically significant findings.

Yet a report summarizing the proceedings of a panel on the psychology of women at the annual meeting of the American Psychoanalytic Association in 1976 claims that "there is increasing evidence of distinction between the mother's basic attitudes and handling of her boy and girl children starting from the earliest days and continuing thereafter."¹¹ This surprising contradiction suggests that academic psychologists and psychoanalysts must be looking at quite different things. The kinds of differences I am postulating (and that psychoanalysts are beginning to find) are differences of nuance, tone, quality. These differences are revealed in a small range of analytic clinical case material as well as in some cultural research. These cases give us insight into the subtleties of mothers' differential treatment and experiencing of sons and daughters and of the differential development that results.

Pre-Oedipal Mother-Daughter Relationships: The Clinical Picture

Many psychoanalysts report cases of particular kinds of mother-infant relationships which throw light on differences in the pre-Oedipal mother-daughter and mother-son

Rather, the studies they report produce such inconsistent findings that one could support almost any hypothesis about gender differences in treatment by selective references.

On many measures, however, they find that where studies do report a gender difference, it tends to be in the same direction. For instance, where mothers do talk more to children of one gender, it turns out to be to girls; where they touch, hold, or spend more time feeding, it tends to be boys. ' The arousal of gross motor behavior, punishment, and pressure against what is thought to be gender-inappropriate behavior all tend to happen more to boys. I am wary of this seemingly scientific investigation. The message of Maccoby and Jacklin's book is that one cannot find any consistent gender differences anywhere if one looks at the "hard scientific facts." As support against biological arguments for gender differences, these findings may do the trick. But I was left feeling a little as if a magic disappearing trick had been performed. All the experiences of being manipulated, channeled, and restricted which women and men have been commenting on, and which they have felt deeply and continuously, were suddenly figments of our imagination.

¹¹* Not to give up on the academic psychology findings completely, we know that some forms of similar maternal behavior may produce different effects on sons and daughters. For instance, Kagan and Freeman and Crandall report that maternal criticism and lack of nurturance correlate with intellectual achievement in girls but the opposite behavior does in boys. Maternal overprotection and affection predict later conformity in boys, whereas conformity in girls is predicted by excessive severity of discipline and restrictiveness. Therefore, the similarity in maternal behavior which Maccoby and Jacklin report may not have similar effects on feminine and masculine development.

relationship. Fliess presents the psychopathological extreme and also the most numerous examples, unintentionally showing the way a certain sort of psychotic mother inflicts her pathology predominantly on daughters.¹ The mothers of his patients carried to an extreme that which is considered to be, or is described as, "normal" in the pre-Oedipal mother-infant relationship. His account is significant because, having chosen to focus on a certain kind of neurotic patient and accompanying early patient-mother relationship, it turns out that an overwhelmingly large percentage (almost eight times as many) of his case illustrations are women. His explanation for this disproportion is that "the picture is more easily recognized in the female because of the naturally longer duration of the pre-Oedipal phase." This explanation is tautological, because he is talking about precisely those features of maternal behavior which in a less extreme but similar form create and maintain a pre-Oedipal relationship in the normal case.

The mothers that Fliess describes were "asymbiotic" during the period when their child needed symbiosis and experienced oneness with them. They were unable to participate empathetically in a relationship to their child. However, from the time that these daughters began to differentiate themselves mentally from their mothers and to practice physical separation, these mothers became "hypersymbiotic." Having denied their daughters the stability and security of a confident early symbiosis, they turned around and refused to allow them any leeway for separateness or individuation. Instead, they now treated their daughters and cathected them as narcissistic physical and mental extensions of themselves, attributing their own body feelings to them. The mothers took control over their daughters' sexuality and used their daughters for their own autoerotic gratification. As Fliess puts it, "The mother employs the 'transitivity' of the psychotic" - "I am you and you are me" - in her experiencing and treatment of her daughter. The result, in Fliess's patients, was that these daughters, as neurotics, duplicated many features of their mothers' psychotic symptoms, and retained severe ego and body-ego distortions. Their ego and body-ego retained an undifferentiated connection to their mother. Their relation to reality was, like an infant's, mediated by their mother as external ego.

Thus, these mothers maintained their daughters in a nonindividuated state through behavior which grew out of their own ego and body-ego boundary blurring and their perception of their daughters as one with, and interchangeable with, themselves. If we are to believe Fliess's account, this particular pathology - the psychotic distortion and prolongation of the normal pre-Oedipal relationship - is predominantly a mother-daughter phenomenon.

Olden, Enid Balint, and Angel provide further examples of the tendencies Fliess describes. Balint describes a state she calls "being empty of oneself - a feeling of lack of self, or emptiness. This happens especially when a person who has this feeling is with others who read the social and emotional setting differently but do not recognize this, nor recognize that the person herself is in a different world.

Balint claims that women are more likely to experience themselves this way. Women who feel empty of themselves feel that they are not being accorded a separate reality nor the agency to interpret the world in their own way. This feeling has its origins in

In what follows, I rely on extensive accounting and quoting. This is necessary because a simple assertion of the distinctions that I wish to demonstrate would not be persuasive without the clinical illustrations.

the early mother-daughter relationship. Balint provides a case example to illustrate. She claims that the "empathy" of the patient's mother was a false empathy, that from the outset it was probably a distorted projection of what the mother thought her infant daughter's needs should be. As her daughter grew, and was able to express wants and needs, the mother systematically ignored these expressions and gave feedback not to her actual behavior but rather to what she had in the first place projected onto her child. Balint describes the results of this false empathy: "Because of this lack of feedback, Sarah felt that she was unrecognized, that she was empty of herself, that she had to live in a void." This mother-infant interaction began in earliest infancy, but certainly continued throughout the patient's childhood. It is useful to quote Balint at length to indicate the quality of this mother-daughter interaction:

(i) [Although she] on the surface developed satisfactorily, there was apparently a vitally important area where there was no reliable understanding between mother and daughter. (ii) Although the mother tried her best, she responded more to her own preconceived ideas as to what a baby ought to feel than to what her baby actually felt ____ Probably Sarah's mother could not bear unhappiness or violence or fear in her child, did not respond to it, and tried to manipulate her so that everything wrong was either put right at once or denied.

(Hi) What was missing, therefore, was the acceptance that there might be bad things, or even good ones, which must be recognized; that it is not sufficient merely to put things right; moreover, that the child was neither identical with her mother, nor with what the mother wanted her to be ____

Sarah's mother was impervious to any communication which was different from the picture she had of her daughter, and, in consequence, Sarah could not understand her mother's communications and felt that her mother never saw her as she was; neither found an echo in the other; and consequently only a spurious interaction between the growing child and the environment could develop.

Olden describes a disruption in mother-child empathy that occurs when mothers who had originally formed (or seem to have formed) an appropriate unity with their infant were then unable to give it up. She is describing "a specific psychic immaturity that will keep a mother from sensing her child's needs, from following his pace and understanding his infantile world; and in turn keep the child from developing ego capacities." Olden does not note that both cases she recounts are mother-daughter cases (one in which the daughter - a child - was in analysis, the other from an analysis of the mother). Both mothers felt unreal and were depressed. Olden described characteristics that both Balint and Fliess describe. The mothers lacked real empathy but had pseudo-empathy which kept the daughters from forming their own identity, either through identifying and feeling like someone or through contrasting themselves to someone (this was more true for the daughter who had less relationship to her father). The mothers attained instinctual gratification through their daughters, not through directly using their daughters for autoerotic gratification, but by identifying vicariously with their sexuality and sex lives.

The Olden cases move even further from pathology than Balint, and further toward the norm that the direction of pathology implies. These mothers felt real closeness to their daughters, unlike the Balint and Fliess examples. Olden describes

The mothers were, in Fliess's terms, hypersymbiotic but not asymbiotic.

two very immature mothers who shared and, as it were, acted out the children's wishes yet were unable to perceive their children's real needs. These mothers and their children were extremely attached to each other; some of their friends characterized the relationship as "overidentification." Despite this emotional closeness, or perhaps on account of it, the mothers were unable to empathize with their children; the goal and function of this "closeness" was exclusively narcissistic.

These mothers had maintained the primitive narcissistic mother-infant fusion with their children. This enabled them vicariously to gratify their own frustrated instinctual needs by virtue of projecting themselves onto the child.

Angel provides further examples, this time by contrasting adult patients rather than by discussing the mother-infant relationship itself. He is contrasting "symbiosis and pseudosymbiosis" - two versions of fantasies and wishes of merging in adult patients.

In (real) symbiosis, according to Angel, there is an extreme fear of merging as well as a wish to merge, because there is no firm sense of individuation in the first place. In pseudosymbiosis, there need not be and is not such fear, because the distinction between self and object is firm, and the wish to (re)merge is only a defensive one, usually against feelings of aggression toward the object:

- 1 In symbiosis, merging fantasies are a true reflection of the state of the ego; the self and object representations are merged.
- 2 In pseudosymbiosis, merging fantasies are defensive formations, and the self and object representations are more or less distinct.
- 3 In adults with true symbiotic object relations, the scale is weighted heavily on the side of fixation to the infantile symbiotic phase. In pseudosymbiosis, the element of fixation is minimal or absent, and the scale is weighted heavily on the side of defensive regression.²⁶

Between symbiosis and pseudosymbiosis is a middle syndrome, which arises through fixation to the period when separateness is being established but still fluctuates and is in doubt. Like Olden, Angel does not tie his distinction to gender differences. His case examples of true symbiosis and in-between syndrome are women, however, and his case example of pseudosymbiosis is a man. This points again to gender differences in issues of separateness and sense of self.

The choices of examples by Fliess, Olden, Angel, and Balint are not accidental. The patterns of fusion, projection, narcissistic extension, and denial of separateness they describe are more likely to happen in early mother-daughter relationships than in those of mothers and sons. The same personality characteristics in mothers certainly produce problematic mother-son relationships, but of a different kind. In all these cases, the mother does not recognize or denies the existence of the daughter as a separate person, and the daughter herself then comes not to recognize, or to have difficulty recognizing, herself as a separate person. She experiences herself, rather, as a continuation or extension of (or, in the Balint case, a subsumption within) her mother in particular, and later of the world in general.

In the next two examples, my interpretation is less secure. Both authors give examples of mothers and daughters and mothers and sons to demonstrate a larger issue - as Burlingham phrases it, "empathy between infant and mother," and as

Sperling puts it, "children's interpretations and reaction to the unconscious of their mother."²⁸ It is my impression that although there was certainly understanding or empathy between mothers and children of both genders, and ways in which children of both genders lived out their mother's preoccupations or fantasies, the quality of the child's empathy and its reaction to the mother's unconscious differed according to gender. With one possible exception, Burlingham and Sperling describe girls who act *as extensions of* their mothers, who act out the aggression which their mothers feel but do not allow themselves to recognize or act on. They describe boys, by contrast, who equally intuitively *react to* their mothers' feelings and wishes as if they were the *objects* of their mothers' fantasies rather than the subjects. Girls, then, seem to become and experience themselves as the self of the mother's fantasy, whereas boys become the other.

Neither Burlingham nor Sperling links her insights to gender differences. However, Burlingham mentions that when she and her children were in analysis at the same time, and an issue preoccupying her would arise in the analysis of her children, appearing "out of context... as if it were a foreign body," these links were more obvious with sons than daughters. Burlingham does not have an explanation. If my interpretation is right, then the explanation is that her daughter's preoccupations, as continuations of her, might appear more ego-syntonic - seeming to emerge out of her daughter's ego - and thus be less identifiable than issues which emphasized her sons as acted-on objects.

These accounts indicate the significance of gender differences, despite the lack of attention paid to these differences. With the exception of Balint, who says that being empty of oneself is found more often in women, the authors claim simply to focus on a certain kind of person and certain kind of early mother-infant relationship, and then either use predominantly *mother-daughter* examples or *mother-daughter* and *mother-son* examples which reflect gender-linked variations in the processes they discuss, as in the cases of Angel, Burlingham, and Sperling. All these accounts indicate, in different ways, that prolonged symbiosis and narcissistic over-identification are particularly characteristic of early relationships between mothers and daughters.

Pre-Oedipal Mother-Son Relationships: The Clinical Picture

Both the absence of mother-son examples in some discussions, and their character in others, indicate how early mother-daughter relationships contrast to those between a mother and son. In Burlingham and Sperling, sons are objects for their mothers, even while they maintain symbiotic bonds of empathy and oneness of identification. In the Angel case, a man pretends symbiosis when boundaries are in fact established.

It is hard to substantiate this impression without repeating all of the cases involved. I report them, however, because there are few such cases in the literature. I encourage the most committed (or skeptical) to read them.

Ann, described by Sperling.²⁹ In one case, for instance, a son (Paul, described by Sperling) has become a substitute for the mother's brother, toward whom she had and continues to have very complicated feelings.

Psychoanalytic and anthropological clinical accounts further illuminate specific tendencies in early mother-son relationships.³ Bibring argues that the decline of the husband's presence in the home has resulted in a wife "as much in need of a husband as the son is of a father." This wife is likely to turn her affection and interest to the next obvious male - her son - and to become particularly seductive toward him. Just as the father is often not enough present to prevent or break up the mother-daughter boundary confusion, he is also not available to prevent either his wife's seductiveness or his son's growing reciprocated incestuous impulses. A mother, here, is again experiencing her son as a definite other - an opposite-gendered and -sexed other. Her emotional investments and conflicts, given her socialization around issues of gender and sex and membership in a sexist society, make this experience of him particularly strong. The son's solution, moreover, emphasizes differentiation buttressed by heavy emotional investment. He projects his own fears and desires onto his mother, whose behavior he then gives that much more significance and weight.

Slater's account of Greek mother-son relationships in the Classical period, read into his later work on contemporary American society, gives us further insight into the dynamics Bibring discusses.³² Greek marriages, Slater suggests, were characterized by a weak marital bond, and the society was ridden with sex antagonism and masculine fear and devaluation of mature women. Wives were isolated in their marital homes with children. In reaction, mothers reproduced in their own sons the same masculine fears and behaviors that their husbands and the men in their society had. They produced in these sons a precarious and vulnerable masculinity and sense of differentiation by alternating sexual praise and seductive behavior with hostile deflation, ridicule, and intrusive definitions of their sons' intrapsychic situation. Like the maternal treatment Bibring discusses, this treatment kept sons dependent on their mothers for a sense of self-sufficiency and self-esteem. At the same time, it emphasized these sons' sexuality and sexual difference, and encouraged participation in a heavily sexualized relationship in boys who had not resolved early issues of individuation and the establishment of ego boundaries.

Bibring's and Slater's work implies that in societies like ours, which are male-dominated but have relatively father-absent families and little paternal participation in family life and child care, masculinity and sexual difference ("Oedipal" issues)

Slater discusses the psychic outcome of structural features of the family and the organization and ideology of gender not unique to Greek society but very much present in our own. His later works do not present his analysis in such full detail, though they assume that it is very much applicable to American society. Therefore, I rely in what follows on the analysis of Greece to shed light on our contemporary situation.

This combination of the blurring of generational boundaries between mother and son, and the elevation of the son to a role as masculine partner, or opposite, to the mother, replicates Lidz's description of schizophrenogenic family structure and practice for boys.³³ Slater in fact suggests that maternal treatment of sons in Greece was schizophrenogenic. He points out that we have no record of the actual incidence of madness in ancient Greek society, but that Greek culture was dominated by maternally caused madness: "No other mythology with which I am familiar contains so many explicitly designated

instances of madness ____ The most striking fact is that of all the clear instances of madness deliberately produced in one being by another, none can be said to be caused by a truly masculine or paternal agent. Most are afflicted by goddesses, and the remainder by the effeminate Dionysus, himself a previous victim at the hands of Hera ____ Nor is the relationship between the sex of an agent and the sex of a victim a random one: in the overwhelming majority of cases madness is induced in persons of the opposite sex."

become intertwined with separation-individuation ("pre-Oedipal") issues almost from the beginning of a boy's life. This conclusion receives confirmation from Whiting's cross-cultural analyses of patrilocal societies with sleeping arrangements in which children sleep exclusively with their mothers during their first two years (and husband/fathers sleep elsewhere) and postpartum sex taboos. Such societies are usually characterized by a general pattern of sex segregation and sex antagonism -again, a (perhaps) extreme form of the sex-gender arrangements in modern society.

Such arrangements create difficulties for the development of a sense of masculinity in boys. Although their account is allegedly about feminine role identification, Whiting and his colleagues are in fact talking about the period of early infancy. In some formulations of the problem, it is clear that they are concerned with fundamental feelings of dependence, overwhelming attachment, and merging with the mother, developed by a son during the intense and exclusive early years, that he feels he must overcome in order to attain independence and a masculine self-identification. They suggest further that an explicitly sexual relationship between mother and son may exist. Citing "clinical evidence from women in our own society suggesting that nursing is sexually gratifying to some women at least,"³ and informant reports in one society with postpartum sex taboo and mother-infant sleeping arrangements that mothers had no desire for sex as long as they were nursing, they suggest that "it is possible that the mother obtains some substitute sexual gratification from nursing and caring for her infant."

Cross-cultural accounts of father-absence and mother-infant sleeping arrangements do not mention the effects of extreme father-absence and antagonism between the sexes on mother-daughter relationships or on female development. It may well be that the kind of mother-daughter boundary confusion and overidentification I have discussed here is the answer. Slater suggests that it is not simply sleeping arrangements but maternal ambivalence and inconsistent behavior toward sons which lead to the results Whiting describes. Without this ambivalence and seductiveness, mother-infant sleeping arrangements may not produce conflict and dependency. Alternatively, it may be that dependency in girls is not, in the patriarchal cultural case, an obstacle to the successful attainment of femininity.

I conclude, from the evidence in Bibring's, Slater's and Whiting's accounts, that a mother, of a different gender from her son and deprived of adult emotional, social, and physical contact with men (and often without any supportive adult contact at all), may push her son out of his pre-Oedipal relationship to her into an Oedipally toned relationship defined by its sexuality and gender distinction. Her son's maleness and oppositeness as a sexual other become important, even while his being an infant remains important as well. Because of this, sons (men) come to have different kinds of pre-Oedipally engendered problems than daughters (women). Greenacre points to these in her discussion of the genesis of "perversions" and especially of fetishism, which, according to psychoanalysts, are predominantly masculine phenomena.

Slater does not restrict his discussion to the period of the early mother-son relationship. But all the relational and ego problems he discusses, and his use of the label "oral-narcissistic dilemma" to summarize these, point to early mother-infant issues: myths concerned with birth, with maternal attacks on the infant in the womb or on the neonate, with oral reincorporation by the mother; or with the maternal lack of reality principle vis-a-vis her son.

In fact, their omission provided the original impetus for my study here.

Greenacre suggests that fetishes, and other perversions as well, serve to deny (on an unconscious level usually) that women do not have penises: "The phallic woman [is a] ubiquitous fantasy in perversions."* The reason the fetishist needs to deny the existence of different genitalia than his own is that his sense of his own genital body identity is not firm. Being presented with different genitalia, therefore, he feels threatened and potentially castrated himself. Greenacre argues that fetishism is a result of conflict centering on issues of separation and individuation in the early years. It results from boundary confusion and a lack of sense of self firmly distinguished from his mother, leading him to experience (again, all this is probably not conscious) as his own what he takes to be the castration of first his mother and then women in general.

Greenacre's account points to gender differences surrounding early issues of differentiation and individuation. Even while primary separateness is being established in boys, issues of masculinity and conflicts around genital differences are important. Her account also leads me to conclude that the early period is sexualized for boys in a way that it is not for girls, that phallic-masculine issues become intertwined with supposedly nongender-differentiated object-relational and ego issues concerning the creation of a sense of separate self.

According to Greenacre and Herman Roiphe, children of both genders go through a phase during their second year when their genitals become important as part of their developing body self and their developing gender identity.¹ Conflictual object-relations concerning these issues can lead a child to focus anxiety and emotion on genital difference - to develop castration anxiety or penis envy. Greenacre's account indicates, however, that this aspect of individuation is more important and conflictual for men. That the early mother-son relationship is likely to emphasize phallic Oedi-pal issues along with pre-Oedipal individuation issues explains this difference. It is another instance in which a supposedly nongender-differentiated process has different meanings for boys and girls.

In a society like ours, in which mothers have exclusive care for infants and are isolated from other adults, in which there is physical and social separation of men/ fathers from women/mothers and children, and institutionalized male dominance, a mother may impose her reactions to this situation on her son, and confuse her relationship to him as an infant with a sexualized relationship to him as a male. It is precisely such a situation which accounts for the early entrance into the Oedipus situation on the part of boys in our society.

I realize that this kind of claim verges on the incredible to those unpersuaded by psychoanalytic theory. It is certainly the area in psychoanalytic theory in which I feel least comfortable, but in this case Greenacre's account is persuasive and illuminating.

As noted previously, children of both genders go through a symbiotic phase of unity, primary identification, and mutual empathy with their mother, and then go through a period of differentiation from her - but these issues remain more central for women.

Barbara Deck (personal communication) suggests that whether the boy is a child or an adult makes a big difference to his mother. As a little man with a penis, he excites her; however, in order for her fondling and sexualized treatment not to produce conscious guilt, he must remain a neuter baby. This ambivalence does not arise in the case of a girl baby, who is "just a baby" or at most a "baby mother/ self." She is not an *other*, like a "baby husband" or a "baby father."

Conclusions

The clinical and cultural examples I have discussed all point to the conclusion that pre-Oedipal experiences of girls and boys differ. The girl's pre-Oedipal mother-love and preoccupation with pre-Oedipal issues are prolonged in a way that they are not for the boy. With the exception of Whiting's cross-cultural analysis, all the examples I cite are cases which their authors have taken to be noteworthy for their "abnormality" or "pathology." However, the extent of such pathology varies (from preoccupation to mild neurosis to psychosis). More important, there is systematic variation in the form it takes depending on whether a person is female or male - on whether we are talking about mother-daughter or mother-son relationships. In all cases the pathology reflects, in exaggerated form, differences in what are in fact normal tendencies. The cases give us, as Freud suggests about neurosis in general, insight into what we would otherwise miss just because it is subtle, typical, and familiar. These cases, then, point to typical gender differences in the pre-Oedipal period, differences that are a product of the asymmetrical organization of parenting which founds our family structure.

Because they are the same gender as their daughters and have been girls, mothers of daughters tend not to experience these infant daughters as separate from them in the same way as do mothers of infant sons. In both cases, the mother is likely to experience a sense of oneness and continuity with her infant. However, this sense is stronger, and lasts longer, vis-a-vis daughters. Primary identification and symbiosis with daughters tend to be stronger and cathexis of daughters is more likely to retain and emphasize narcissistic elements, that is, to be based on experiencing a daughter as an extension or double of a mother herself, with cathexis of the daughter as a sexual other usually remaining a weaker, less significant theme.

Other accounts also suggest that mothers normally identify more with daughters and experience them as less separate. Signe Hammer's book, *Daughters and Mothers: Mothers and Daughters*, based on interviews with over seventy-five mothers, daughters, and grandmothers, describes how issues of primary identification, oneness, and separateness follow mother-daughter pairs from a daughter's earliest infancy until she is well into being a mother or even grandmother herself:

Most of the daughters in this book have received enough support from their mothers to emerge from the stage of complete symbiosis in early infancy. But for the vast majority of mothers and daughters, this emergence remains only partial. At some level mothers and daughters tend to remain emotionally bound up with each other in what might be called a semisymbiotic relationship, in which neither ever quite sees herself or the other

42

as a separate person.

Hammer's study is certainly confirmed by my own discussions with a number of mothers of daughters and sons, first in a women's group devoted to the discussion and analysis of mother-daughter relationships in particular and family relationships in general, and later with individual acquaintances. Finally, the resurfacing and prevalence of pre-Oedipal mother-daughter issues in adolescence (anxiety, intense and exclusive attachment, orality and food, maternal control of a daughter's body, primary identification) provide clinical verification of the claim that elements of the pre-Oedipal mother-daughter relationship are maintained and prolonged in both maternal and filial psyche.

Because they are of different gender than their sons, by contrast, mothers experience their sons as a male opposite. Their cathexis of sons is more likely to consist from early on in an object cathexis of a sexual other, perhaps in addition to narcissistic components. Sons tend to be experienced as differentiated from their mothers, and mothers push this differentiation (even while retaining, in some cases, a kind of intrusive controlling power over their sons). Maternal behavior, at the same time, tends to help propel sons into a sexualized, genitally toned relationship, which in its turn draws the son into triangular conflicts.

Early psychoanalytic findings about the special importance of the pre-Oedipal mother-daughter relationship describe the first stage of a general process in which separation and individuation remain particularly female developmental issues. The cases I describe suggest that there is a tendency in women toward boundary confusion and a lack of sense of separateness from the world. Most women do develop ego boundaries and a sense of separate self. However, women's ego and object-relational issues are concerned with this tendency on one level (of potential conflict, of experience of object-relations), even as on another level (in the formation of ego boundaries and the development of a separate identity) the issues are resolved.

That these issues become more important for girls than for boys is a product of children of both genders growing up in families where women, who have a greater sense of sameness with daughters than sons, perform primary parenting functions. As long as women mother, we can expect that a girl's pre-Oedipal period will be longer than that of a boy and that women, more than men, will be more open to and preoccupied with those very relational issues that go into mothering - feelings of primary identification, lack of separateness or differentiation, ego and body-ego boundary issues and primary love not under the sway of the reality principle. A girl does not simply identify with her mother or want to be like her mother. Rather, mother and daughter maintain elements of their primary relationship which means they will feel alike in fundamental ways. Object-relations and conflicts in the Oedipal period build upon this pre-Oedipal base.

I must admit to fudging here about the contributory effect in all of this of a mother's sexual orientation - whether she is heterosexual or lesbian. Given a female gender identity, she is "the same as" her daughter and "different from" her son, but part of what I am talking about also presumes a different kind of cathexis of daughter and son deriving from her heterosexuality.

The Black Hole of Trauma

Bessel A. van der Kolk and Alexander C. McFarlane

Attention has turned in literary criticism in recent decades to the issue of trauma. In this selection from their book *Psychological Stress: the Effects of Overwhelming Experience on Mind, Body, and Society* (1996), van der Kolk and McFarlane provide an account of how traumatic experiences can damage the psyche and leave indelible marks on it.

A stimulus impinging on the mind can be conceived as behaving like a "... raindrop land[ing] on a terrain of hills and valleys. The drop moves generally downhill until it ends up at the bottom of a nearby valley. The deeper the memory basin and the steeper the walls, the more likely the train of associations is likely to end up in it. In PTSD [Post Traumatic Stress Disorder] the traumatic event may be conceptualized as occupying... a Dead Sea of memory, into which all too many of the patient's associations inexorably flow" (Tank and Hopfield, 1987, p. 106).

—As quoted in Pitman and Orr (1990, p. 469)

Experiencing trauma is an essential part of being human; history is written in blood. Although art and literature have always been preoccupied with how people cope with the inevitable tragedies of life, the large-scale scientific study of the effects of trauma on body and mind has had to wait till the latter part of this century - when the average life expectancy in the industrialized world is well above the Biblical three score and ten; when almost all children can be expected to outlive their parents; and when famine and epidemics no longer wipe out large sections of the population with the regularity that they once did.

Humans owe their ascendance in the animal kingdom to their extraordinary capacity to adapt. Throughout evolution humans have been exposed to terrible events; yet most people who are exposed to dreadful experiences survive without developing psychiatric disorders. Throughout history, some people have adapted to terrible life events with flexibility and creativity, while others have become fixated on the trauma and gone on to lead traumatized and traumatizing existences. Societies that have been massively traumatized have followed roughly similar patterns of adaptation and disintegration (e.g., Tuchman, 1978; Buruma, 1994). Many survivors seem to be able to transcend their trauma temporarily and harness their pain in acts of sublimated creation; for example, the writers and Holocaust survivors Jerzy Kosinski and Primo Levi seem to have done this, only to succumb to the despair of their memories in the end.

Despite the human capacity to survive and adapt, traumatic experiences can alter people's psychological, biological, and social equilibrium to such a degree that the memory of one particular event comes to taint all other experiences, spoiling appreciation of the present. This tyranny of the past interferes with the ability to pay attention to both new and familiar situations. When people come to concentrate selectively on reminders of their past, life tends to become colorless, and contemporary experience ceases to be a teacher. In much of the remainder of this book, we discuss what makes people vulnerable to developing such a fixation on trauma, and what can help them overcome it.

The Systematic Study of Trauma

Since psychiatry has started to organize psychological problems in a diagnostic system that is based purely on their surface manifestations, it has, as a profession, increasingly lost interest in the workings of the mind and the mystery of medicine (Nemiah, 1995). Paradoxically, this has meant that the study of trauma has become the soul of psychiatry: The development of posttraumatic stress disorder (PTSD) as a diagnosis has created an organized framework for understanding how people's biology, conceptions of the world, and personalities are inextricably intertwined and shaped by experience. The PTSD diagnosis has reintroduced the notion that many "neurotic" symptoms are not the results of some mysterious, well-nigh inexplicable, genetically based irrationality, but of people's inability to come to terms with real experiences that have overwhelmed their capacity to cope.

In important ways, an experience does not really exist until it can be named and placed into larger categories. In Biblical mythology, Adam's first and main task in Paradise was to give names to the animals; the act of naming made him master over creation. The acceptance of the formal category of PTSD was a critical first step in making it possible to name the effects of overwhelming experiences on soma and psyche, and thus to open up the systematic investigation of how people come to be overwhelmed, how different people organize tragic experiences over time, and how their suffering can be alleviated. The recognition of PTSD as a legitimate psychiatric diagnosis has led to an explosion of scientific studies that have systematically examined many notions and popular prejudices about the effects of trauma.

Although there has been and continues to be concern about stigmatizing people with psychiatric labels in general, the diagnosis of PTSD seems to have been received by victims as a legitimization and validation of their psychic distress. Having a recognizable psychiatric disorder can help people make sense of what they are going through, instead of feeling "crazy" and forsaken. A diagnosis also bestows a sense of communality with other victims.

Essentially, the introduction of the PTSD diagnosis has opened a door to the scientific investigation of the nature of human suffering. Although much of human art and religion has always focused on expressing and understanding man's afflictions, science has paid scant attention to suffering as an object of study. Hitherto, science has generally categorized people's problems as discrete psychological or biological disorders - diseases without context, largely independent of the personal histories of the patients, their temperaments, or their environments. PTSD, then, serves as a model for correcting the decontextualized aspects of today's psychiatric

nomenclature. It refocuses attention back on the living person instead of our overly concrete definitions of mental "disorders" as "things" in and of themselves, bringing us back to people's own experiences and the meaning which they assign to it (Nemiah, 1989).

PTSD has turned out to be a very common disorder. Exposure to extreme stress is widespread, and a substantial proportion of exposed individuals become symptomatic. A random survey of 1,245 American adolescents showed that 23% had been the victims of physical or sexual assaults, as well as witnesses of violence against others. One out of five of the exposed adolescents developed PTSD. This suggests that approximately 1.07 million US teenagers currently suffer from PTSD (Kilpatrick, Saunders, Resnick, and Smith, 1995). Another survey (Elliot and Briere, 1995) found that 76% of American adults reported having been exposed to extreme stress. Nine percent of an urban population in a large North American city suffered from PTSD (Breslau and Davis, 1992), and approximately 20 years after the end of the Vietnam War, 15.2% of US Vietnam theater veterans continued to suffer from PTSD (Kulka et al., 1990). The majority of psychiatric inpatients have consistently been found to have histories of severe (usually intrafamilial) trauma, and at least 15% meet diagnostic criteria for PTSD itself (Saxe et al., 1993). The available figures for the rest of the industrialized world are compatible with those of the United States. Outside of that world, no data are currently available.

Most people who have been exposed to traumatic stressors are somehow able to go on with their lives without becoming haunted by the memories of what has happened to them. That does not mean that the traumatic events go unnoticed. After exposure to a trauma, most people become preoccupied with the event; having involuntary intrusive memories is a normal way of responding to dreadful experiences. This repeated replaying of upsetting memories serves the function of modifying the emotions associated with the trauma, and in most cases creates a tolerance for the content of the memories (Horowitz, 1978). However, with the passage of time, some people are unable to integrate the awful experience and start developing the specific patterns of avoidance and hyperarousal that are associated with PTSD. What distinguishes people who develop PTSD from people who are merely temporarily stressed is that they start organizing their lives around the trauma. Thus, it is the persistence of intrusive and distressing recollections, and not the direct experience of the traumatic event itself, that actually drives the biological and psychological dimensions of PTSD (McFarlane, 1992; Creamer, Burgess, and Pattison, 1992). Although most people who suffer from PTSD have considerable interpersonal and occupational problems, the degree to which the symptoms of PTSD come to affect overall functioning varies a great deal from person to person.

The scientific study of suffering inevitably raises questions of causation, and with these, issues of blame and responsibility. Historically, doctors have highlighted predisposing vulnerability factors for developing PTSD, at the expense of recognizing the reality of their patients' experiences. This search for predisposing factors probably had its origins in the need to deny that all people can be stressed beyond endurance, rather than in solid scientific data; until very recently, such data were simply not available. When the issue of causation becomes a legitimate area of investigation, one is inevitably confronted with issues of man's inhumanity to man, with carelessness and callousness, with abrogation of responsibility, with manipulation,

and with failures to protect. In short, the study of trauma confronts one with the best and the worst in human nature, and is bound to provoke a range of intense personal reactions in the people involved (Herman, 1992; Wilson and Lindy, 1994; Pearlman and Saakvitne, 1995).

Reality versus Neurosis

Unlike other forms of psychological disorders, the core issue in trauma is reality: "It is indeed the truth of the traumatic experience that forms the center of its psycho-pathology; it is not a pathology of falsehood or displacement of meaning, but of history itself (Caruth, 1995, p. 5). However, the critical element that makes an event traumatic is the subjective assessment by victims of how threatened and helpless they feel. So, although the reality of extraordinary events is at the core of PTSD, the meaning that victims attach to these events is as fundamental as the trauma itself. People's interpretations of the meaning of the trauma continue to evolve well after the trauma itself has ceased. This is well illustrated by a case of delayed PTSD reported by Kilpatrick et al. (1989): A woman who was raped did not develop PTSD symptoms until some months later, when she learned that her attacker had killed another rape victim. It was only when she received this information that she reinterpreted her rape as a life-threatening attack and developed full-blown PTSD.

This raises the question of how PTSD compares with the old notion of neurosis. Psychoanalysis held that the essence of neurosis is the pathological persistence of defense mechanisms employed to ward off unacceptable unconscious wishes and impulses. Over time, the ego is "hardened," defenses are consolidated, and "earlier conflict is transformed into chronic automatic modes of functioning... detached from the content of infantile conflict" (Shapiro, 1965, p. 7). "Once hardened, character continues to have a protective function. It 'binds' impulses in stable ways, limits flexibility, and constitutes an armor against the external world" (p. 8). Thus, the meaning that individuals cull out of the present depends on their prior experience and on the many subtle and indirect ways that their personal past has been incorporated into their current attitudes and beliefs. This can lead to a range of maladaptive responses in their current lives, to which "neurotics" keep responding as if they were reliving the past.

These notions about the nature of neurotic defense mechanisms are quite relevant in understanding how people adapt to trauma. All traumatized people develop their own peculiar defenses to cope with intrusive recollections and increased physiological arousal. Prior to the acceptance of the concepts of psychopathology that underpin PTSD, clinical thinking was dominated by the exclusive attention to secondary psychic elaborations, at the expense of paying attention to the realities that continue to drive these repetitions. The exploration of the fantasized elaborations of intrapsychic conflicts was seen as the sole purpose of the treatment of neuroses.

When people are traumatized, the choice of defenses is influenced by developmental stage, temperamental and contextual factors. Hence, the diagnosis of PTSD alone never fully captures the totality of people's suffering and the spectrum of adaptations that they engage in. However, even though psychodynamic psychiatry is invaluable in helping us understand the characterological adaptations to the memories of the trauma, the core issue in PTSD is that the primary symptoms are not symbolic,

defensive, or driven by secondary gain. The core issue is the inability to integrate the reality of particular experiences, and the resulting repetitive replaying of the trauma in images, behaviors, feelings, physiological states, and interpersonal relationships. Thus, in dealing with traumatized people, it is critical to examine where they have become "stuck" and around which specific traumatic event(s) they have built their secondary psychic elaborations.

Fixation on the Trauma

The posttraumatic syndrome is the result of a failure of time to heal all wounds. The memory of the trauma is not integrated and accepted as a part of one's personal past; instead, it comes to exist independently of previous schemata (i.e., it is dissociated). Some cognitive formulations of PTSD have proposed that a traumatic experience confronts an individual with experiences completely different from what he or she has been able to imagine before, and that this confrontation with the trauma radically shakes the individual's attitudes and beliefs (Janoff-Bulman, 1992). This may be true in some cases in which people encounter totally unexpected events or are confronted with aspects of the human capacity for evil that they had never before imagined. However, often trauma does not present a radically new experience, but rather confirms some belief that an individual has tried to evade. For many patients, what is most destructive about a traumatic event is that it confirms some long-feared belief, rather than presenting them with a novel incongruity.

Immediately after a traumatic event, almost all people suffer from intrusive thoughts about what has happened (McFarlane, 1992; Creamer et al., 1992; Joseph, Yule, and Williams, 1995). These intrusions help them either to learn from the experience and plan for restorative actions (accommodation), or to gradually accept what has happened and readjust their expectations (assimilation) (cf. Lindemann, 1944; Horowitz, 1978). One way or another, the passage of time modifies the ways in which the brain processes the trauma-related information. Either it is integrated in memory and stored as an unfortunate event belonging to the past, or the sensations and emotions belonging to the event start leading a life of their own. When people develop PTSD, the replaying of the trauma leads to sensitization; with every replay of the trauma, there is an increasing level of distress. In those individuals, the traumatic event, which started out as a social and interpersonal process, comes to have secondary biological consequences that are hard to reverse once they become entrenched. This new organization of experience is thought to be the result of iterative learning patterns, in which trauma-related memories become kindled; that is, repetitive exposure etches them more and more powerfully into the brain (van der Kolk and Greenberg, 1987; Post, 1992; McFarlane, Yehuda, and Clark, in press). These biological (mal)adaptations ultimately form the underpinnings of the remaining PTSD symptoms: problems with arousal, attention, and stimulus discrimination, and a host of psychological elaborations and defenses.

Ordinarily, memories of particular events are remembered as stories that change over time and that do not evoke intense emotions and sensations. In contrast, in PTSD the past is relived with an immediate sensory and emotional intensity that makes victims feel as if the event were occurring all over again. The "Grant Study," a longitudinal study of the psychological and physical health of 200 Harvard

undergraduates who participated in World War II, is a good illustration of how people process traumatic events (Lee, Vaillant, Torrey, and Elder, 1995). When these men were reinterviewed about their experiences 45 years later, those who did not have PTSD had considerably altered their original accounts; the most intense horror of the events had been diluted. In contrast, time had not modified the memories of the minority of subjects who had developed PTSD. Thus, paradoxically, the ability to transform memory is the norm, whereas in PTSD the full brunt of an experience does not fade with time.

Information Processing in PTSD

There are six critical issues that affect how people with PTSD process information: (1) They experience persistent intrusions of memories related to the trauma, which interfere with attending to other incoming information; (2) they sometimes compulsively expose themselves to situations reminiscent of the trauma; (3) they actively attempt to avoid specific triggers of trauma-related emotions, and experience a generalized numbing of responsiveness; (4) they lose the ability to modulate their physiological responses to stress in general, which leads to a decreased capacity to utilize bodily signals as guides for action; (5) they suffer from generalized problems with attention, distractibility, and stimulus discrimination; and (6) they have alterations in their psychological defense mechanisms and in personal identity. This changes what new information is selected as relevant.

Intrusions

When Charcot (1887) first described traumatic memories over a century ago, he called them "parasites of the mind." Because people with PTSD have a fundamental impairment in the capacity to integrate traumatic experiences with other life events, their traumatic memories are often not coherent stories; they tend to consist of intense emotions or somatosensory impressions, which occur when the victims are aroused or exposed to reminders of the trauma. These intrusions of traumatic memories can take many different shapes: flashbacks; intense emotions, such as panic or rage; somatic sensations; nightmares; interpersonal reenactments; character styles; and pervasive life themes (Laub and Auerhahn, 1993). Years and even decades after the original trauma, victims claim that their reliving experiences are as vivid as when the trauma first occurred (van der Kolk and Fisler, 1995). Because of this timeless and unintegrated nature of traumatic memories, victims remain embedded in the trauma as a contemporary experience, instead of being able to accept it as something belonging to the past.

The personal meaning of the traumatic experience evolves over time, and often includes feelings of irretrievable loss, anger, betrayal, and helplessness. One of the serious complications that interferes with healing is that one particular event can activate other, long-forgotten memories of previous traumas, and create a "domino effect": A person who was not previously bothered by intrusive and distressing memories may, after exposure to yet another traumatic event, develop such memories of earlier experiences. For example, in an emergency medical technician who has witnessed many gruesome and horrifying events in the course of his or her career,

one more dreadful event may trigger recollections of a host of previous experiences. Similarly, a sexual assault in adulthood may provoke long-forgotten memories of childhood abuse, and medical procedures in elderly concentration camp survivors may bring back memories to which the individuals may not have had access for decades.

Paradoxically, even though vivid elements of the trauma intrude insistently in the form of flashbacks and nightmares, many traumatized people have a great deal of difficulty relating precisely what has happened. People may experience sensory elements of the trauma without being able to make sense out of what they are feeling or seeing (van der Kolk and Fisler, 1995). One of the gravest symptoms of having been overwhelmed by a traumatic experience can be total amnesia. For example, describing the reactions to trauma in some Holocaust survivors, Henry Krystal noted that "no trace of registration of any kind is left in the psyche; instead, a void, a hole, is found" (Krystal, 1968).

Over time, the initial intrusive thoughts of the trauma may come to contaminate the individual's responses to a range of other cues and reinforce the selective dominance of the traumatic memory networks (Pitman and Orr, 1990; Pitman, Orr, and Shalev, 1993). Triggers for intrusive traumatic memories may become increasingly more subtle and generalized; what should be irrelevant stimuli may become reminders of the trauma. For example, a firefighter may not be able to wear a watch because this acts as a reminder of having to get to respond to sudden emergencies, or a combat veteran may become upset by the sound of rain because it suggests the monsoon season in Vietnam. This contrasts with more typical triggers that have an obvious connection to a traumatic memory, such as sexual situations for rape victims, or the sound of a firecracker (misinterpreted as the sound of gunfire) for war veterans.

We and our colleagues (van der Kolk and Ducey, 1989; McFarlane, Weber, and Clark, 1993), using two entirely different methodologies, were able to show that people who suffer from PTSD develop biased perception, so that they respond preferentially to trauma-related triggers at the expense of being able to attend to other perceptions. As a consequence, they have smaller repertoires of neutral or pleasurable internal and environmental sensations that could be restitutive and gratifying. This decreased attention to non-trauma-related stimuli adds further to the centrality of the trauma.

Compulsive reexposure to the trauma

One set of behaviors that is not mentioned in the diagnostic criteria for PTSD is the compulsive reexposure of some traumatized individuals to situations reminiscent of the trauma. This phenomenon can be seen in a wide range of traumatized populations. For example, combat soldiers may become mercenaries or join police SWAT teams; abused women may be attracted to men who mistreat them; sexually molested children may grow up to become prostitutes. Understanding this seemingly paradoxical phenomenon is of critical importance, because it could help to clarify many forms of social deviance and interpersonal misery. Freud (1920/1955) thought that the aim of such repetition is to gain mastery, but clinical experience shows that this rarely happens; instead, repetition causes further suffering for the victims and for the people around them (van der Kolk, 1989). In this reenactment of the trauma, an individual may play the role of either victimizer or victim.

1 *Harm to others.*

Reenactment of victimization is a major cause of violence in society. Numerous studies have documented that many violent criminals were physically or sexually abused as children (e.g., Groth, 1979; Seghorn, Boucher, and Prentky, 1987). In a prospective study of 34 sexually molested boys, Burgess, Hartman, and McCormick (1987) found a link with drug abuse, juvenile delinquency, and criminal behavior within a few years after the abuse was first noticed. Dorothy Lewis and her colleagues (Lewis and Balla, 1976; Lewis et al., 1979) have also extensively documented the association between childhood abuse and subsequent victimization of others.

2 *Self-destructiveness.*

Self-destructive acts are common in abused children. Studies consistently find a highly significant relationship between childhood sexual abuse and various forms of self-harm later in life, particularly suicide attempts, cutting, and self-starving (e.g., van der Kolk, Perry, and Herman, 1991). Clinical reports consistently show that most self-mutilators have childhood histories of physical or sexual abuse or repeated surgery (Graff and Mallin, 1967; Pattison and Kahan, 1983; Briere, 1988). Simpson and Porter (1981) sum up the consensus conclusion in stating that "self-destructive activities were not primarily related to conflict, guilt, and superego pressure, but to more primitive behavior patterns originating in painful encounters with hostile caretakers during the first years of life."

3 *Revictimization.*

Many traumatized individuals continue to be revictimized. Rape victims are more likely to be raped again, and women who were physically or sexually abused as children are more likely to be abused as adults (van der Kolk, 1989). Victims of child sexual abuse are at high risk of becoming prostitutes (Finkelhor and Browne, 1984; Silbert and Pines, 1981). Diane Russell (1986), in her well-known study of incest's effects on the lives of women, found that few women made a conscious connection between their childhood victimization and their later drug abuse, prostitution, and suicide attempts.

These phenomena are seldom understood by either victims or clinicians as repetitive reenactments of real events from the past. Understanding and remedying the fact that traumatized people tend to lead traumatizing and traumatized lives remain among the great challenges of psychiatry.

Avoiding and numbing

Once traumatized individuals become haunted by intrusive reexperiences of their trauma, they generally start organizing their lives around avoiding having the emotions that these intrusions evoke (van der Kolk and Ducey, 1989). Avoidance may take many different forms, such as keeping away from reminders, ingesting drugs or alcohol in order to numb awareness of distressing emotional states, or utilizing dissociation to keep unpleasant experiences from conscious awareness. This avoidance of specific triggers is aggravated by a generalized numbing of responsiveness to a whole range of emotional aspects of life. Despite the fact that numbing and avoidance are lumped together in the *Diagnostic and Statistical Manual of Mental Disorders*, fourth edition (DSM-IV; American Psychiatric Association, 1994), numb-

ing probably has a very different underlying pathophysiology from avoidance (e.g., van der Kolk et al., 1994). Studies of combat veterans (e.g., Kardiner, 1941), concentration camp survivors (Krystal, 1968), and other victim populations (Titchener, 1986) have described a gradual withdrawal and detachment from everyday activities. Krystal (1968) called this reaction "dead to the world," Kardiner (1941, p. 249) "a deterioration that is not dissimilar to that in schizophrenia," and Titchener (1986) "post-traumatic decline." Thus, many people with PTSD not only actively avoid emotional arousal, but experience a progressive decline and withdrawal, in which *any* stimulation (whether it is potentially pleasurable or aversive) provokes further detachment. To feel nothing seems to be better than feeling irritable and upset.

It would be an error to think of this detachment and withdrawal in PTSD either merely as a psychodynamic phenomenon, or as a deficit of certain neurotransmitters that can be "fixed" with the administration of neurotransmitter supplements (i.e., antidepressants or other psychopharmacological agents that stimulate the release of neurohormones). Roughly speaking, it seems that the chronic hyperarousal of PTSD depletes both the biological and the psychological resources needed to experience a wide variety of emotions (van der Kolk et al., 1985; Litz, 1992). McFarlane et al. (in press) have proposed that as intrusive memories come to dominate their thinking, people with PTSD become more and more sensitized to environmental stimuli that remind them of the trauma. Thus, over time, they become less and less responsive to various stimuli that are necessary for involvement in the present. They have proposed that this underresponsiveness leads to a series of changes in the central nervous system that are similar to the effects of prolonged sensory deprivation.

Litz et al. (1995) have proposed that the resulting failure to process emotional events fully leads to further physiological hyperarousal and to psychosomatic problems. Indeed, psychosomatic problems and emotional numbing in PTSD are intimately related (van der Kolk et al., in press). This line of investigation is further supported by the work of Pennebaker (1993) and others (e.g., Spiegel, 1992), which has shown that low levels of emotional expression lead to impairment of immune function and to an increase in physical illness.

Inability to modulate arousal

Although people with PTSD tend to deal with their environment through emotional constriction, their bodies continue to react to certain physical and emotional stimuli as if there were a continuing threat of annihilation; they suffer from hypervigilance, exaggerated startle response, and restlessness. Research has clearly established that people with PTSD suffer from conditioned autonomic arousal to trauma-related stimuli; however, evidence in recent years also suggests that many traumatized individuals suffer from extreme physiological arousal in response to a wide variety of stimuli.

People with PTSD tend to move immediately from stimulus to response without often realizing what makes them so upset. They tend to experience intense negative emotions (fear, anxiety, anger, and panic) in response to even minor stimuli; as a result, they either overreact and threaten others, or shut down and freeze. These hyperarousal phenomena represent complex psychological and biological processes, in which the continued anticipation of overwhelming threat seems to cause difficulties with attention

and concentration. In turn, these difficulties give rise to distortions in information processing, including narrowing of attention onto sources of potential challenge or threat. Children and adults with such hyperarousal tend to experience sleep problems, both because they are unable to quiet themselves sufficiently to go to sleep, and because they deliberately wake themselves up in order to avoid having traumatic nightmares.

Perhaps the most distressing aspect of this hyperarousal is the generalization of threat. The world increasingly becomes an unsafe place: Innocuous sounds provoke an alerting startle response; trivial cues are perceived as indicators of danger. Ordinarily, autonomic arousal serves the very important function of alerting people to pay attention to potentially important situations. However, for persons who are chronically hyperaroused, the autonomic nervous system loses that function; the easy triggering of somatic stress reactions makes them unable to rely on their bodily sensations as an efficient warning system against impending threat. The persistent, irrelevant firing of warning signals causes physical sensations to lose their functions as signals of emotional states and, as a consequence, they stop serving as guides for action. Thus, like neutral environmental stimuli, normal physical sensations may take on a new and threatening significance. The person's own physiology becomes a source of fear.

The PTSD sufferers' inability to decipher messages from the autonomic nervous system interferes with their capacity to articulate how they are feeling (alexithymia) and makes them tend to react to their environment with either exaggerated or inhibited behaviors. After a traumatic experience, many people regress to earlier levels of coping with stress. In children, this may manifest itself as an inability to take care of themselves in such areas as feeding and toilet training; in adults, it is expressed in impulsive behavior, excessive dependence, and a loss of the capacity to make thoughtful, autonomous decisions.

Attention, distractibility, and stimulus discrimination

Freud (1911/1959) described how, in order to function properly, people need to be able to define their needs, anticipate how to meet them, and plan for appropriate action. In order to do this, they first need to be able to consider a range of options without resorting to action - a capacity Freud called "thought as experimental action." People with PTSD seem to lose this capacity; they have problems fantasizing and playing with options. Studies both of traumatized children (e.g., Rieder and Cicchetti, 1989) and of traumatized adults (e.g., van der Kolk and Ducey, 1989) indicate that when traumatized people allow themselves to fantasize, this creates the danger of breaking down their barriers against being reminded of the trauma. In order to prevent this from happening, they become constricted and seem to organize their lives around *not* feeling and *not* considering options for the best ways of responding to emotionally arousing problems. Their problems with keeping thoughts in their minds without becoming aroused contribute greatly to their impulsivity.

People with PTSD have difficulty in sorting out relevant from irrelevant stimuli; they have problems ignoring what is unimportant and selecting only what is most relevant. Easily over stimulated, they compensate by shutting down. In a study using event-related potentials, McFarlane et al. (1993) were able to demonstrate these difficulties in stimulus discrimination. The price of these problems is loss of involvement in ordinary, everyday life. This makes it even harder for these patients to get their minds off the trauma, and thus only increases the strength of their fixation on the

trauma. As a result, the individuals lose the capacity to respond flexibly to their environment. This loss of flexibility may explain current findings of deficits in preservative learning and interference with the acquisition of new information (Bremner et al., 1993; Yehuda et al., 1995), as well as an inability to apply working memory to salient environmental stimuli (van der Kolk and Ducey, 1989; McFarlane et al., 1993).

Alterations in defense mechanisms and changes in personal identity

In recent years, much has been written about trauma's effects on people's sense of themselves and their relationship to their environment (Cole and Putnam, 1992; Herman, 1992; Pearlman and Saakvitne, 1995). Reiker and Carmen (1986) have pointed out that "confrontations with violence challenge one's most basic assumptions about the self as invulnerable and intrinsically worthy, and about the world as orderly and just. After abuse, the victim's view of self and world can never be the same again: it must be reconstructed to incorporate the abuse experience" (p. 362). Of course, how old a person is when the trauma happens, and what the person's previous life experiences have been like, will profoundly affect his or her interpretation of the meaning of the trauma (van der Kolk and Fisler, 1994).

Many traumatized individuals, particularly children, tend to blame themselves for having been traumatized. Assuming responsibility for the trauma allows feelings of helplessness and vulnerability to be replaced with an illusion of potential control. Ironically, rape victims who blame themselves have a better prognosis than those who do not assume this false responsibility; it allows their locus of control to remain internal and prevents helplessness (Burgess and Holstrom, 1979). Traumatized children are even more likely to blame themselves: "The child needs to hold on to an image of the parent as good in order to deal with the intensity of fear and rage which is the effect of the tormenting experiences" (Reiker and Carmen, 1986, p. 368). In the context of these sorts of conflicts, defense mechanisms are activated that are designed to provide an accommodation with an intolerable reality.

The question of shame is critical to understanding the lack of self-regulation in trauma victims and the capacity of abused persons to become abusers. Trauma is usually accompanied by intense feelings of humiliation; to feel threatened, helpless, and out of control is a vital attack on the capacity to be able to count on oneself. Shame is the emotion related to having let oneself down. The shame that accompanies such personal violations as rape, torture, and abuse is so painful that it is frequently dissociated: Victims may be unaware of its presence, and yet it comes to dominate their interactions with the environment. Denial of one's own feelings of shame, as well as those of other people, opens the door for further abuse. Being sensitive to the shame in others is an essential protection against abusing one's fellow human beings, and it requires being in touch with one's own sense of shame. Similarly, not being in touch with one's own shame leaves one vulnerable to further abuse from others. The resulting disorganized patterns of engagement are commonly seen in traumatized people who suffer from borderline personality disorder, who need to be helped to understand how this perpetuates their getting hurt and their hurting others.

Fixation on the Diagnosis

Despite efforts to capture the essence of people's response to trauma, the PTSD diagnosis does not begin to describe the complexity of how people react to overwhelming experiences. The DSM's emphasis on phenomenological diagnoses has resulted in a loss of interest in the way symptoms are interrelated and reflect subtle interactions between psychological and biological processes (Nemiah, 1995). Yet the same underlying psychopathology can have a range of symptomatic expressions. For example, when "hysteria" was first diagnosed and related to prior histories of trauma by Briquet in 1859, and subsequently by the school of the Salpetriere under Charcot, posttraumatic symptoms were primarily expressed as conversion reactions and as psychosomatic conditions. Those patterns seem to have persisted as the primary expressions of traumatic stress during World War I. Even though the same symptoms were described in combat soldiers during World War II, descriptions of soldiers at that time focused primarily on psychophysiological reactions and loss of impulse control. Descriptions of Vietnam veterans have focused on intrusive recollections and on characterological adaptations. Does this mean that the symptomatic expression of traumatic stress has changed in Western culture over time, or have clinicians focused on different aspects of the same syndrome during the past century and a half? Given the rather marked differences in vulnerability and symptoms among Vietnam combat soldiers belonging to different ethnic groups (Kulka et al., 1990), it is likely that the prevailing culture has a marked effect on the symptomatic expression of traumatic stress.

The complexity of people's responses to trauma, and the comparative simplicity of the PTSD conceptualization, are illustrated by the recent rediscovery of the intimate association among trauma, dissociation, and somatization (van der Kolk et al., in press). Trauma can affect victims on every level of functioning: biological, psychological, social, and spiritual. Conceptualized in terms of psychiatric diagnosis, this means that PTSD has a high rate of psychiatric comorbidity with mood, dissociative, and anxiety disorders; substance abuse; and character pathology (Green, Lindy, Grace, and Leonard, 1992; Davidson, Hughes, Blazer, and George, 1991; Kulka et al., 1990). The National Comorbidity Survey (Kessler, Bromet, and Nelson, in press) and the DSM-IV field trials for PTSD (van der Kolk, Roth, Pelcovitz, and Mandel, 1993) showed that people with simple diagnoses of PTSD were less likely to seek treatment than people who suffered from associated problems, such as depression, uncontrolled anger, and dissociation. As long as they can make meaning out of the trauma, victims often experience the symptoms of PTSD as natural reactions that do not require professional help. For example, a study of Pearl Harbor survivors found they viewed their recurrent nightmares of the bombing as perfectly understandable reactions to the terrible events they had witnessed on December 7, 1941. In their case, there never was a question about the validation of their experience (Harel, Kahana, and Wilson, 1993).

Focusing solely on PTSD to describe what victims suffer from does not do justice to the complexity of what actually ails them. Excessive attention to the intrusion/numbing/arousal phenomena of PTSD may severely limit observations of how people react to trauma, and may thus interfere with appropriate treatment. The recognition of the profound personality changes that can follow childhood trauma or prolonged exposure in adults has been an important development, because these

changes are major sources of distress and disability. This issue is beginning to be recognized by the inclusion of complex adaptations to trauma in the form of disturbed affect regulation, aggression against self and others, dissociative problems, somatization, and altered relationships with self and others in the "Associated Features and Disorders" section of the DSM-IV's entry on PTSD (American Psychiatric Association, 1994, p. 425).

Historicisms

Introduction: Writing the Past

Julie Rivkin and Michael Ryan

In the early 1980s a critic named Stephen Greenblatt coined a term for the kind of criticism he was doing - he called it New Historicism - and the name stuck. Greenblatt himself went on to question the term, and to rename his own practice Cultural Poetics, but New Historicism was launched. The name is useful, however much questioned by its founder, as much because it acknowledges an older form of historicism as for its enunciation of something new. We use the term Historicisms here to indicate the range of theoretical practices that are historical, and we might well begin with a more traditional kind of historicism.

Back when New Criticism was getting itself named new, one kind of traditional criticism that it was replacing was historical. This historical work might or might not be governed by a specific theory of history - such as, for example, Marxism - but it would invariably see the historical as a context for the study of the literary work. Historical background, historical context: the language of a traditional historicism saw the literary work in the foreground and history in the background, with the task of the critic being to connect the two. The literary work might represent or refer to the historical context; the critic would make sense of the literary work by researching the history to which it referred. Without such background information, how could the reader understand anything from the wars fought in a Shakespeare play to the property laws that governed the plot of an Austen novel? One notable consequence was that a literary critic needed to read a good deal of nonliterary work, and the critic's enterprise led to the historical archive. Biographical, social, cultural, political - there were as many possibilities as there were schools of historical study, and the literary critic might share with his colleague in history a knowledge of certain eras or institutions that could make him look like an early advocate of interdisciplinarity. Indeed, such was the accusation of the New Critics, who were interested in distinguishing and clarifying the uniquely literary nature of their enterprise, and in sending the historians, sociologists, and biographers of literary study off to their separate fields of study. But history has returned to literary study, and like any repressed entity, it has done so with a vengeance. Literary study today is pervasively historical.

The first return of history falls under the denomination of New Historicism. New Historicism distinguished itself from its antecedents largely because of the way in which the concept of history it assumed had passed through a Post-Structuralist critique. What such a critique makes explicit is the textuality of history, the way in which history is only available as a collection of discourses. Foucault is the Post-Structuralist historian who most influenced this critical approach, and his histories of everything from madness to sexuality are histories of the discourses that have

constructed the past. New Historians, in the wake of Foucault, see the historical as textual, and one effect is to create a new relationship between the historical and the literary text. Because both are representations, a term very important to the New Historians (so much so that it is the title of a New Historical journal), neither one is closer to the "truth" of history. History is not some unmediated reality out there, some stable background that the literary text reflects or refers to; it is not a context. Rather, it is like the literary text itself - of a different genre, granted, but no less a discourse. Such a view might seem to undo the privilege of the literary text or of "history" - depending on whether someone valorizes an aesthetic distinction or an ontological one - but it does make it possible to study relations between texts both literary and historical and discover how they trace certain patterns and negotiate various kinds of cultural meaning.

What kinds of patterns interest the New Historian? Influenced at once by Foucauldian and Marxist theories of history, the New Historian focuses on issues of power - with a particular interest in the ways in which power is maintained by unofficial means such as the theatricality of royal display in the Court. This New Historicist view was most clearly articulated in response to a critique from a more Marxist school of historiography called cultural materialism. The cultural materialists argued that all power is fragile, subject to undermining by dissident elements within a society, and they believed that literature inadvertently displays the fissures in power, the moments of subversion where the precariousness of power is most palpable. Responding to their critique, Greenblatt argued that subversion itself was a ruse of power. His essay, entitled "Invisible Bullets," referred to a ploy of English colonists, who characterized the diseases ravaging Native populations as God-sent punishment for disobedience to their colonial masters; in Greenblatt's argument, the containment of subversion was like the "invisible bullets" of germ warfare used to contain native resistance. A playwright like Shakespeare might evoke the undermining of royal power in his *Henry* plays, but in the end, such undermining merely serves the ends of reinforcing that power all the more forcefully. At a certain point, subversion and containment were almost the catch phrases of New Historicism.

Another preoccupation of New Historicism is with the circulation of discourses both within and through various texts. Any text itself will have a mode of circulation — it will have a place within an economic system - but it will also serve to circulate certain discourses. To see the discourses circulating in a particular era, one needs to see not only their literary manifestation but also their presence in other kinds of cultural representations. The New Historian is selective in an approach to the archive; the historical text that illuminates a pattern might be a single manifesto or conduct book, a broadside or a periodical. All texts might be called interventions in such patterns, in that they do not merely reflect but have effects on the cultural situation they represent. A New Historicist essay will often put the same reading practices into play for all the texts it studies, with the nonliterary subject to the same close reading as the literary.

At present, the exemplary New Historicist practice typified by the Greenblatt essay included here has given way to more wide-ranging kinds of historicist work. The turn to history is a crucial part of the current scene in literary study and is one conducted under the aegis of many critical approaches. Feminism and gender studies, post-colonialism and ethnic studies: the categories of analysis are themselves historical, and in the anti-essentialism of the moment few would be willing to adopt

a vocabulary without historicizing it. Who, for example, can speak the terms of gender or race without recognizing that they are historically constituted? Historicism in literary study received a highly visible revival with the creation of New Historicism, but in some sense the wider success of historicism is evidenced in the ways historicism has entered almost every other critical approach. Thus, the explicitly historicist selections we have included here might be extended to include everything from C. L. R. James's study of the revolution in Haiti, *The Black Jacobins*, to Gerald Vizenor's work on nostalgic imagery of the "vanishing" Native Americans, *Native Poses* to Paul Gilroy's account of a circum-Atlantic African cultural diaspora in "Black Atlantic."

A historian recently characterized his discipline as one in which knowledge is presumed to be diachronic, across time, to use the vocabulary introduced by Saussure. Saussure himself focused on a synchronic mode of analysis, we might note. Historicism today is, in fact, both diachronic and synchronic. That is, many contemporary historicist critics draw on the synchronic analysis of Saussure and his structuralist heirs, who show "reality" to be constituted of systems of signs, realms of discourse that work to construct a version of the real. Understanding "history" as discursively produced allows one to consider the source of a given discourse, its genealogy, to use a term important to Foucault, and along with its source the perspective it might serve. In a recent film entitled *The Official Story*, an Argentinian woman who teaches history in a high school is brought face to face with the discrepancy between history as she is teaching it, as her government wants her to teach it, with all of its occlusions, and history as she is living it. Reading between the lines of "the official story," she discovers an alternative discourse being produced by the mothers of the disappeared (victims of Argentina's right-wing military dictatorship), a discourse that inhabits her own family, however much the official story denies its existence. Or to cite a different example, in a preface to Frederick Douglass's *Narrative*, Wendell Phillips recounts the fable of "The Man and the Lion" in which the Lion complains that he would not be so misrepresented "when the lions write history." Frederick Douglass, a fugitive slave for whom literacy itself was against the law, was Wendell Phillips's lion, and he was writing history. Presumably the disappeared can tell no stories. No more can lions. But the metaphor of their missing stories is another way to mark the place of alternative discourses, alternative histories, of all the historical work yet to be done in the ever-expanding processes of writing the past.

The Country and the City

Raymond Williams

Raymond Williams was the leading cultural historian in England from the 1950s to the 1980s. His work is the basis for the contemporary school of criticism known as Cultural Materialism. In his 1973 book, *The Country and the City*, he examined the changing significance of the two sites in English literature from the Renaissance down to the twentieth century.

The Morality of Improvement

(i)

The true history of the English countryside has been centred throughout in the problems of property in land, and in the consequent social and working relationships. By the eighteenth century, nearly half of the cultivated land was owned by some five thousand families. As a central form of this predominance, four hundred families, in a population of some seven or eight million people, owned nearly a quarter of the cultivated land. Beneath this domination, there was no longer, in any classical sense, a peasantry, but an increasingly regular structure of tenant farmers and wage-labourers: the social relationships that we can properly call those of agrarian capitalism. The regulation of production was increasingly in terms of an organised market.

The transition from feudal and immediately post-feudal arrangements to this developing agrarian capitalism is of course immensely complicated. But its social implications are clear enough. It is true that the predominant landowning class was also, in political terms, an aristocracy, whose ancient or ancient-seeming titles and houses offered the illusion of a society determined by obligations and traditional relations between social orders. But the main activity of this class was of a radically different kind. They lived by a calculation of rents and returns on investments of capital, and it was the process of rack-renting, engrossing and enclosure which increased their hold on the land.

Yet there was never any simple confrontation between the four hundred families and a rural proletariat. On the contrary, between these poles of the economic process there was an increasingly stratified hierarchy of smaller landowners, large tenants, surviving small freeholders and copyholders, middle and small tenants, and cottagers and craftsmen with residual common rights. A process begun in the sixteenth century was still powerfully under way, with many of the smaller farms being suppressed, especially on improved arable land, while at the same time the area of cultivated land was itself steadily and at times dramatically increased. Even within

the social relations of landowner, tenant, and labourer, there was a continual evolution of new attitudes. An estate passed from being regarded as an inheritance, carrying such and such income, to being calculated as an opportunity for investment, carrying greatly increased returns. In this development, an ideology of improvement - of a transformed and regulated land - became significant and directive. Social relations which stood in the way of this kind of modernisation were then steadily and at times ruthlessly broken down.

The crisis of values which resulted from these changes is enacted in varying ways in eighteenth-century literature. In poetry, as we shall see, the idealisation of the happy tenant, and of the rural retreat, gave way to a deep and melancholy consciousness of change and loss, which eventually established, in a new way, a conventional structure of retrospect.

But before this development, there was a lively engagement with the human consequences of the new institutions and emphases. Indeed it was in just this interest that the novel emerged as the most creative form of the time. The problems of love and marriage, in a society dominated by issues of property in land, were extended from the later Jacobean comedy and the Restoration comedy of manners, and from the moral epistles of Pope, to the novels of Richardson and Fielding, and in the mode of their extension were transformed. Airworthy and Squire Western, the neighbouring landowners in Fielding's *Tom Jones*, or Lovelace in Richardson's *Clarissa*, are in some ways lineal descendants of the world of Wellborn and Overreach, and then of Tunbelly Clumsey and Young Fashion. The plot of *Tom Jones* is based on the desire to link by marriage the two largest estates in Somersetshire: the proposed marriage of Sophia Western to Blifil is conceived for this end; her marriage to Tom Jones, when he is eventually revealed as Allworthy's true heir, achieves what had formerly, for personal reasons, been rejected. Similarly, *Clarissa Harlowe's* proposed marriage to Solmes is part of her family's calculation in concentrating their estates and increasing their rank; it is from this that she recoils to the destructive and cynical world of the established landowning aristocrat, Lovelace.

What is dramatised, under increasing pressure, in the actions of these novels, is the long process of choice between economic advantage and other ideas of value. Yet whereas, in the plays, we saw this from one particular standpoint - the social world of London in which the contracts were made and in which, by isolation and concentration, the tone of the protesting and then the cynical observer could be established and maintained - in the novels we move out to the families themselves, and see the action in its homes and in its private character. For all the differences between Richardson and Fielding, this change is something they have in common. Instead of the formal confrontation between representatives of different groups - the wellborn and the overreachers - and the amused observation of a distanced way of the world, the action becomes internal, and is experienced and dramatised as a problem of character.

The open ideology of improvement is in fact most apparent in Defoe, but in an abstraction which marks an essential difference from Richardson and Fielding. There is some irony in this fact, in that in his *Tour of England and Wales*, in the 1720s, Defoe was an incomparable observer of the detailed realities of country life, with his notes on methods of production, marketing and rents. It is from him that we learn the degree of specialisation and market-production in early eighteenth-century agriculture, and its intricate involvement with the cities, the ports, and the early coal,

iron and cloth industrial areas. It is a frankly commercial world, with hardly any pastoral tinge, and Defoe's combination of intense interest and matter-of-fact reporting is the true predecessor of the major eighteenth-century tradition of rural inquiry, which runs on through William Marshall, the *County Reports*, Arthur Young and the *Annals of Agriculture*, to Cobbett and the nineteenth century. This emphasis is the real line of development of a working agriculture, and is in itself a major index of change. Yet, with rare exceptions, this emphasis was in its own way an abstraction from the social relationships and the human world through which the new methods of production worked. It is only at the end of this line, in the crisis at the turn of the century, that the social and economic inquiries are adequately brought together. It is then not surprising that Defoe, for all his close and specialised observation of what was happening in the fields and markets, did not, in his novels, consider their underlying social reality. Rather he projected, into other histories, the abstracted spirit of improvement and simple economic advantage - as most notably in *Robinson Crusoe* - and created a fictional world of isolated individuals to whom other people are basically transitory and functional - as again in *Crusoe* and in *Moll Flanders*. Consciously and unconsciously, this emphasis of a condition and of an ethic was prophetic and powerful; but it is an indication of its character that what *Crusoe* improves is a remote island, and that what *Moll Flanders* trades in is her own person. The important improvement and trading were at once nearer home and more general, but the simple practice and ethic of improvement could be more readily and more singlemindedly apprehended in deliberately isolated histories.

In the real life of the country, the commercial spirit had to interlock with, and be tested by, other institutions, considerations and modes. Neither Richardson nor Fielding knew as much as Defoe about what was happening in rural England, but their emphasis, in very different ways, was on human relationships in their more detailed course: not the spirit of the time, but its more immediate experience.

Yet we cannot, in turn, make an abstraction of these human relationships. When the marriage of Sophia and Blifil is proposed, as a way of uniting the neighbouring estates, the character of Blifil is shown in the true contemporary commercial spirit:

as to that entire and absolute possession of the heart of his mistress which romantic lovers require, the very idea of it never entered his head. Her fortune and her person were the sole objects of his wishes, of which he made no doubt soon to obtain the absolute property _

Squire Western, of course, uses his daughter to unite the estates, as if it were the most natural thing in the world. And Allworthy-

not one of those men whose hearts flutter at any unexpected and sudden tidings of worldly profit²

- is nevertheless recommended to us by his more sober and philosophical calculations:

Wisdom... only teaches us to extend a simple maxim universally known and followed even in the lowest life, a little farther than that life carries it. And this is, not to buy at too dear a price. Now, whoever takes this maxim abroad with him into the grand

market of the world, and constantly applies it to honours, to riches, to pleasures, and to every other commodity which that market affords, is, I will venture to affirm, a wise man, and must be so acknowledged in the worldly sense of the word; for he makes the best of bargains, since in reality he purchases everything at the price only of a little trouble, and carries home all the good things I have mentioned, while he keeps his health, his innocence and his reputation, the common prices which are paid for them by others, entire and to himself.

This, indeed, is very much the position from which *Tom Jones* is written. It is the morality of a relatively consolidated, a more maturely calculating society. From such a position, the cold greed of a Blifil, the open coarseness of a Squire Western, can be noted and criticised; but calculation, and cost, are given a wider scheme of reference. Love, honour, physical pleasure, loyalty: these, too, have to be brought into the reckoning with incomes and acres. The humanity is of a resigned and settled kind: firm and open when faced by the meaner calculators, but still itself concerned to find the balance - the true market price - of happiness. Tom Jones learns from his apparent disregard of advantage, but it is not only that his more immediate satisfactions are tolerantly underwritten; it is also that Fielding's management of the action is directed towards restoring the balance in which personal satisfaction and material advantage are reconciled, compatible, and even identical. The novel continually raises questions about the relations between material fortune and human need and impulse, but it resolves them by an adaptation in which, by an act of will, by a planned and fortunate disclosure, they come loosely and easily together. The famous irony is then the literary means by which this trick can be played, noticed, and still win. The tone of the settlement, when Jones is discovered as the rightful heir, and the estates can be united in what is also a love match, is of a deliberate - one might say a calculating -geniality -

in which, to our great pleasure, though contrary, perhaps, to thy expectation, Mr Jones appears to be the happiest of all humankind.

The settlements, the adjustments, the pensions are then neatly worked; and the 'condescension, indulgence and beneficence', of this finally happy pair is such as to make those below them, the tenants and servants, bless the marriage.

There was need, certainly, for this consolidated morality. The openly cynical scramble for land and for heiresses, which had been the predominant tone of an earlier period, was succeeded, in the more settled process of the first half of the eighteenth century, by just this wider, longer-sighted building of position. Humanity, family interest, personal need, must now, if at all possible, be included in any rational and improving settlement. If it was not possible, the main current of advantage took its way, leaving its human casualties.

It is significant that this darker view comes to us, in literature, through a particular fanaticism: the isolation, by Richardson, of virginity, as a single response to the whole struggle for human value. It is true that, in *Pamela*, virginity is treated as the term of a bargain: not a value in itself, but an asset which must not be surrendered without the necessary security of marriage. But in *Clarissa* the virginity is not negotiable, at any level or by any means; it is no longer simply a physical but a spiritual virginity: an integrity of the person and the soul. When the marriage to Solmes is

proposed, as part of 'the darling view of *raising a family*' (that is, of consolidating and improving the family estates), Clarissa's answer -

'For the sake of this plan of my brother's, am I, Madam, to be given in marriage to a man I never can endure?'⁵

- is, though quieter, in the same world as Sophia's, on the proposed marriage to Blifil -

'Oh! sir, such a marriage is worse than death. He is not even indifferent; I hate and detest him.'⁶

But the emphasis, in *Clarissa*, is taken right through. The exposure to Lovelace has nothing to do with the lucky chances of the market, or with raising the price of the human person. It is a total exposure, to a cynically calculating world - significantly that of an earlier kind of landowner, the unmediated because established cavalier, the 'wellborn'. No marriage contract can ratify that exposure; even rape cannot destroy Clarissa's virginity. This is the reverse of consolidation, of the necessary settlement, the striking of a bargain between advantage and value. The integrity of the human person is fanatically preserved, by its refusal to compromise and then its accepted destruction.

In his single emphasis, Richardson moved away from any negotiable world, and of course succeeded in specialising a general crisis to a personal and (in its context) fashionable issue. *Clarissa* is an important sign of that separation of virtue from any practically available world which is a feature of the later phases of Puritanism and still later of Romanticism. Though it engages with the current acquisitiveness and ambition of the landowning families, it is in the end not a criticism of a period or structure of society, but of what can be abstracted as 'the world'. This degree of retreat must be noted, but it is in its own way an answer to the problems being raised by an increasingly confident capitalist society. The specialisation of virginity, and the paradoxical isolation and even destruction of the individual as a means of survival, are connected with that specialisation of pity and charity, and the retreat from society into a nature which teaches humanity, which we shall later trace as responses to the continuing crises of a basically ruthless order, to which there was not, as yet, any available and adequate social response.

(ii)

It must then seem a world away, from the desperate and private emphases of *Clarissa*, to the calmly practical, the inquiring everyday tone of the actual agents of improvement. The social crisis can only be seen, in any connected way, when it is worked through in this everyday and general mode. As we read the agricultural writers, it is easy to accept their emphasis on a better use of the land, even when this is so often explicitly connected with the calculation of rents (Lovelace, interestingly, would never rack-rent old tenants; his income, like his sexual liberty, was inherited rather than speculative). We learn so much from these improving writers, and their achievement (together with that of the experimenting farmers and the better-known experimenting landowners), in providing more food is so impressive that it is easy for

anybody who loves the land to place himself on their side. What is hardest to understand, for them as for us, is the ultimate consequence of just these improvements which in immediate terms were so readily justifiable.

To read the life of Arthur Young is to catch at once the spirit of improvement and its real complications. He grew up on an estate which had been in his father's family for generations, but which was set into order only by capital from his mother's side: a Jewish family which had come from Holland in the late seventeenth century. The old house was rebuilt into a mansion, as so often in this period. This social ambition overreached the family's income. Arthur Young was apprenticed as a merchant; he had wanted, like his father, to be a clergyman. When his father died, he had little money, and began to support himself by writing pamphlets. Then he returned to farm a copyhold of twenty acres, on his mother's small estate. Chronically short of capital, he never succeeded in becoming a successful farmer himself, but as an agricultural writer, collecting and publicising the techniques and spirit of improved production, he made a new kind of life. More than any other man, he made the case for the second great period of enclosures, in the late eighteenth and early nineteenth centuries. He travelled constantly, and in the forty-six volumes of his *Annals of Agriculture* provided the essential means of communication for the new experimental agriculture. The changes came from use of the land itself: in new crops (especially roots), in drainage and reclamation, in planned soil fertility, and in stock breeding. But Young emphasised the connections of the agricultural interest with the other new social forces of the time: with mercantile capital (as he had good reason, from his personal history, to know); with early industrial techniques (as in earth-moving, which was mechanised for harbour-building and quarrying before it was applied to farming-land); with the physical sciences (as in his collaboration with Priestley in soil-chemistry); and with political power and organisation (as in his propaganda to the King and Parliament, and in his eventual appointment as Secretary of the new Board of Agriculture).

Young touched, at every point, what we now see as the modernisation of the land in his century; but what he continually stressed was the backwardness of agriculture, its insufficient rate of progress, its neglect of great areas of waste land, its lack of investment by comparison with overseas trade. And increasingly, towards the end of his life, he admitted his own social experience and the result of his social observations. Thus improvement of land required considerable capital, and therefore the leadership of the landowners. But this not only increased the predominance of the landed interest; it created, by enclosure and engrossing to make large and profitable units, a greater number of the landless and the disinherited, who could not survive or compete in the new conditions. The slowness of many farmers to adopt the new methods was itself related to the land-holding system: since improvement often led to an increase of rent, there was a built-in deterrent at the very point of production. It was only a rare landowner, like Coke, who kept a reasonable relation between the profits of the new production and the rents of his tenants. Thus the economic process, which could be so easily justified in its own limited terms, had social results which at times contradicted it, and at other times led to the disaster of families and communities. When Young saw the full social results of the changes he had fought for, he was not alone in second thoughts and in new kinds of questioning:

I had rather that all the commons of England were sunk in the sea, than that the poor should in future be treated on enclosing as they have been hitherto. ...

Enclosures, Commons and Communities

We have considered several instances of the melancholy of eighteenth-century poems of country life, and we have seen, in Crabbe, their culmination in distress. It is worth emphasising these predominant feelings of loss and pain as we move to that common outline of the history of rural England, in which the campaign of parliamentary enclosures is seen as the destroyer of a traditional and settled rural community.

We have already seen, in Arthur Young, a first estimate of what enclosure amounted to, in its contradictory social and economic consequences. Nobody who follows these through in detail would wish to underestimate them. Yet there is a sense in which the idea of the enclosures, localised to just that period in which the Industrial Revolution was beginning, can shift our attention from the real history and become an element of that very powerful myth of modern England in which the transition from a rural to an industrial society is seen as a kind of fall, the true cause and origin of our social suffering and disorder. It is difficult to overestimate the importance of this myth, in modern social thought. It is a main source for the structure of feeling which we began by examining: the perpetual retrospect to an 'organic' or 'natural' society. But it is also a main source for that last protecting illusion in the crisis of our own time: that it is not capitalism which is injuring us, but the more isolable, more evident system of urban industrialism. The questions involved are indeed very difficult, but for just this reason they require analysis, at each point and in each period in which an element of this structure can be seen in formation.

There is no reason to deny the critical importance of the period of parliamentary enclosures, from the second quarter of the eighteenth century to the first quarter of the nineteenth century. By nearly four thousand Acts, more than six million acres of land were appropriated, mainly by the politically dominant landowners: about a quarter of all cultivated acreage. But it is then necessary to see the essential continuity of this appropriation, both with earlier and with later phases. It is necessary to stress, for example, how much of the country had already been enclosed, before this change of method in the mid-eighteenth century to a parliamentary act. The process had been going on since at least the thirteenth century, and had reached a first peak in the fifteenth and sixteenth centuries. Indeed in history it is continuous from the long process of conquest and seizure: the land gained by killing, by repression, by political bargains.

Again, as the economy develops, enclosure can never really be isolated from the mainstream of land improvements, of changes in methods of production, of price-movements, and of those more general changes in property relationships which were all flowing in the same direction: an extension of cultivated land but also a concentration of ownership into the hands of a minority.

The parliamentary procedure for enclosure made this process at once more public and more recorded. In this sense it was directly related to the quickening pace of agricultural improvement in the late eighteenth and early nineteenth centuries. In this period the area mainly affected was a belt from Yorkshire to Dorset, across the midland counties, and extending eastwards to Norfolk. The same process occurred, a little later, in the Scottish Lowlands. But large tracts elsewhere were already effectively enclosed: Kent, parts of Surrey and Sussex, parts of Essex and Suffolk; Devon,

Cornwall, Somerset and western Dorset; much of Wales and the border counties of Hereford, Shropshire, Staffordshire and Cheshire; the important cultivated areas of Lancashire, Cumberland, Westmorland, Northumberland and Durham. The social importance of enclosures is then not that they introduced a wholly new element in the social structure, but that in getting rid of the surviving open-field villages and common rights, in some of the most populous and prosperous parts of the country, they complemented and were indeed often caused by the general economic pressure on small owners and especially small tenants. No reliable figures are now available, but it can be reasonably argued that as many people were driven from the land, and from some independent status in relation to it, by the continuing processes of rack-renting and short-lease policies, and by the associated need for greater capital to survive in an increasingly competitive market, as by explicit enclosure.

The number of landless, before this period of enclosure, was in any event high: in 1690, five landless labourers to every three occupiers, as compared with a proportion of five to two in 1831. Most of the peasantry, in another sense - the classical sense of the small owner-occupiers under social and political obligations - had been bought and forced out in the period of the building of large estates in the late seventeenth and early eighteenth centuries. G. E. Mingay has concluded that those who survived this process hung on till the fall in product prices in the 1820s, and declined steadily through the nineteenth century, under general pressures:

on the whole it seems that the level of prices and the prosperity of farming had more impact on owner-occupiers than had enclosures.⁸

The peasantry in yet another and very tenuous sense, the small tenant farmers, were of course already part of the system of agrarian capitalism. Their numbers were affected by the economics of scale, and by the aggregation of estates, but enclosure as such did not greatly affect them: in 1831 nearly half of all farms were small, by any ordinary standard. Thus there is no simple case, in the late eighteenth century, of the expropriation of a peasantry. What really happened was that in the economically dynamic areas a capitalist social system was pushed through to a position of dominance, by a form of legalised seizure enacted by representatives of the beneficiary class. This is crucially important, and in the acreage it affected - a quarter of all cultivated land - it can be said to be decisive. But it cannot be isolated from the long development of concentration of landholding, from the related stratification of owners and tenants, and from the increasing number of the landless, which were the general consequences of agrarian capitalism.

The links with the Industrial Revolution are again important, but not as the replacement of one 'order' by another. It is true that many of the landless became, often with little choice, the working class of the new industrial towns, thus continuing that movement of wage labourers to the towns which had long been evident. But the growth of the industrial working-class must be related also, and perhaps primarily, to the growth of population, itself spectacular, which though primarily related to changes in the birth and death rates in the general modernisation of the society, is related also to the increase in agricultural production which was so marked in the eighteenth century: especially in corn, but also in meat; changes themselves related to enclosure and more efficient production. The crisis of poverty, which was so marked in towns and villages alike in the late eighteenth and early nineteenth centuries, was a

result of this social and economic process as a whole, and cannot be explained as the fall of one order and the institution of another. The essential connections between town and country, which had been evident throughout, reached a new, more explicit and finally critical stage. It was characteristic of rural England, before and during the Industrial Revolution, that it was exposed to increasing penetration by capitalist social relations and the dominance of the market, just because these had been powerfully evolving within its own structures. By the late eighteenth century we can properly speak of an organised capitalist society, in which what happened to the market, anywhere, whether in industrial or agricultural production, worked its way through to town and country alike, as parts of a single crisis.

Within these developments, violent alterations of condition occurred, to many thousands of tenants and labourers, and to hundreds of village communities. The new tone we have seen in eighteenth-century country writing is then related to these changes of condition, but also, as we have again seen, to ways of interpreting them. We can find the sense of collapse in Langhorne, from a part of the country where enclosure was not a main issue but where the whole economic and social process was exerting its pressures, as much as in Goldsmith, Crabbe, Cowper, and later Clare and Cobbett, from counties where enclosure was the most visible social fact.

At a certain stage, though, enclosure came to be isolated as a main cause. Young's change of mind, his recognition of social realities, came in the early years of the nineteenth century: by most acts of enclosure the poor had been injured, often grossly, and he imagined the poor man saying:

All I know is, I had a cow and Parliament took it from me.

Cobbett, by the 1820s, was speaking of the 'madness of enclosures' and even denying, with many argued instances, that they had increased production. He pointed out, what was undeniable, that the increased investment and concentration of money in the land had

worked detriment to the labourer. It was out of his bones that the means came. It was the *deduction made from him by the rise of prices and by the not-rise of his wages* (Cobbett's italics).⁹

Cobbett argued in solid terms of the economics of farming, but inevitably from observation of single instances, as when he calculated that the value of bees on a particular Hampshire common was alone greater than the value of that same common enclosed, to say nothing of the cows, pigs and poultry, the apples and cherries, also raised there. But this is the familiar case of a local contrast between a mixed farming economy and the economics of specialisation and scale; in the long run, in trading terms, the latter of course prevailed.

An interesting element was then added to the argument by social observation of life on the old commons. For example Thomas Bewick the engraver, in his *Memoir* written in the 1820s, remembers a Northumberland common of the 1780s, and comments:

On this common — the poor man's heritage for ages past, where he kept a few sheep, or a Kyloe cow, perhaps a flock of geese, and mostly a stock of bee-hives — it was with

infinite pleasure that I long beheld the beautiful wild scenery that was there exhibited, and it is with the opposite feeling that I now find all swept away. Here and there on this common were to be seen the cottage, or rather hovel, of some labouring man, built at his own expense, and mostly with his own hands; and to this he always added a garth and a garden, upon which great pains and labour were bestowed to make productive _ These various concerns excited the attention and industry of the hardy occupants, which enabled them to prosper, and made them despise being ever numbered with the parish poor. These men... might truly be called -
'A bold peasantry, their country's pride'.

It is an attractive and wholly credible account, and we can learn from Bewick as he goes on to describe the independence and originality of mind of many of these men:

I think I see him yet, sitting on a mound, or seat, by the hedge of his garden, regardless of the cold, and intent upon viewing the heavenly bodies; pointing to them with his large hands, and eagerly imparting his knowledge;

or his description of Anthony Liddell -

The whole cast of his character was formed by the Bible, which he had read with attention, through and through. Acts of Parliament which appeared to him to clash with the laws laid down in it, as the Word of God, he treated with contempt. He maintained that the fowls of the air and the fish of the sea were free for all men; consequently, game-laws, or laws to protect the fisheries, had no weight with him;

or of Thomas Forster the beekeeper, who hid many of his hives in the whin, to keep away 'the over-inquisitive'.

From recollections like these, and from more conscious and extended accounts of pre-enclosure villages, a picture was built up which has still great emotional force: of independent and honourable men, living in a working rural democracy, who were coldly and 'legally' destroyed by the new enclosing order.

It is this picture as a whole that we have, even reluctantly, to question. The character given by independence needs little argument, though the character of Thomas Forster the beekeeper, who sold the honey of his home-hives to his neighbours and of his whin-hives at a distance, seems already well on the way to independence in another sense: that of the private entrepreneur who has at best an ambiguous relation to his community. The other kind of character, in which a man has time and spirit to observe, to think and to read, obviously flourished in the relative independence of the cottager, but is also part of the whole history - the glory and the tragedy - of working men everywhere. I do not know any social condition in which, against all the apparent odds, such characters have not emerged: whether it is that of Bewick's commoners, or of the field labourers like Stephen Duck, or of the Sussex shepherd-diarists, or of the amateur geologists and botanists of the Lancashire mill-towns, or of the working-men scholars of our own century, the etymologists, the economists, the local historians. It is part of the insult offered to intelligence by a class-society that this history of ordinary thought is ever found surprising. There were, of course, in all these conditions, men of great capacity who gave a shape to their lives by long effort and wisdom. The values which these men lived and represented are opposed, always and everywhere, by the greed and pride of money, power

and, too often, established learning. In that general sense, the growth of a system which rationalised greed and pride destroyed and has continued to destroy. But what we have also to notice is how much on the defensive, in how small a space of cleared life, the independence of the cottagers was maintained. The question we have to put to this version of social history is not whether some men emerged and survived -they will always do so, under any pressures - but whether, taken as a whole, the way of life could sustain a general independence. That, after all, is the test of community, as opposed to occasional private independence. And then at once we notice, even in Bewick, that the 'parish poor' are already there, as a distinguishable class. We have to notice, what Bewick also tells us, that the independent cottagers:

held the neighbouring gentry in the greatest estimation and respect; and these again, in return, did not overlook them, but were interested in knowing that they were happy and well.¹²

What they have is then a relative and fortunate independence, in an interval of settlement which we can be glad lasted many men's lifetimes. But it is not necessarily an order that we can oppose to what succeeded it, when the same neighbouring gentry showed their interest in a different way and enclosed the commons. The rural class-system was already there, and men were living as they could, sometimes well, in its edges, its margins, its as yet ungrasped and undeveloped areas.

Most records of loss come from these marginal lands: the commons and heaths. But parliamentary enclosure did not only operate on them. Indeed we cannot understand the social consequences of enclosure unless we distinguish between two fundamentally different processes: the enclosure of 'wastes', which in the eighteenth and nineteenth centuries accounted for some two million acres, and the enclosure of open arable fields, already under cultivation, which accounted for some four million acres. It is obvious that the social effects of these two processes must be radically different. What was being suppressed on the wastes was a marginal independence, of cottagers, squatters, isolated settlers in mainly uncultivated land. What was being suppressed in the open-field villages must have been a very different kind of community: the close nucleated villages of an old arable economy. It is remarkable, as W. G. Hoskins has observed, that there is hardly anything in literature to record the passing of such villages, though the complaints of the loss of commons are very numerous. It is possible to read Goldsmith's *Deserted Village* as such a record, but characteristically it is indirect. Yet it is the alteration of the social and economic character of the open-field arable villages that ought most to engage us, if we are thinking of any pre-enclosure 'rural democracy'. Certainly it was the changes here which contributed most substantially to the newly prosperous and consolidated agrarian capitalism. But what kind of social order really existed, in the old open-field village? We must be careful not to confuse the techniques of production - the open-field strips - with what can easily be projected from it, an 'open' and relatively equal society. It is worth looking at the description by a modern rural historian, Fussell, of 'a typical open-field village' of the early eighteenth century. There are three hundred souls. Of these, nearly two hundred are cottagers and labourers and their families, indoor servants, and the unattached poor - widows, orphans, the aged. Some seventy are the copyhold tenant farmers and their families. Some twenty are the freehold farmers and their families. The ten or twelve others are the squire and his family and the

parson and his family. It is an interesting distribution, but it is not, at first sight, so dissimilar from the ordinary social structure of mature rural capitalism as to suggest a radically different social order. There are, in effect, three classes: the gentry; the small entrepreneurs; the unpropertied poor. The inequalities of condition which the village contains and supports are profound, and nobody, by any exercise of sentiment, can convert it into a 'rural democracy' or, absurdly, a commune. The social structure that will be completed after enclosure is already basically outlined.

Yet there are qualifications, and it is these we must try to weigh. Among the cottagers and labourers, for example, some are craftsmen and tradesmen (blacksmith, carpenter, cobbler, carrier, publican), and these and others (though not all the others) have small rights of grazing and fuel on nearby common pastures and wastes. It is easy, in retrospect, for these rights to seem petty, but for at least some men they were an important protection against the exposure of total hire. Again and again, down to our own day, men living in villages have tried to create just this kind of margin: a rented patch or strip, an extended garden, a few hives or fruit trees. When I was a child my father had not only the garden that went with his cottage, but a strip for potatoes on a farm where he helped in the harvest, and two gardens which he rented from the railway company from which he drew his wages. Such marginal possibilities are important not only for their produce, but for their direct and immediate satisfactions and for the felt reality of an area of control of one's own immediate labour. Under the long pressures of a dominating wage-economy, these exceptional areas have been critically important: they still occur, even in towns, in some subsidiary small trade or employment. And there can be little doubt that the pre-enclosure village made such opportunities available for more men than any immediately alternative community. In that sense, a degree of loss is real. But only a degree: for by these methods, while they remained marginal, no whole community could be economically sustained, and stratification within it was still inevitable.

To what extent, then, was there ever a genuine community, in such villages, in spite of the economic and social inequalities? It is very difficult to say, for there were major factual variations (we still need many more local studies and examples), and an estimate of 'community', at this distance in time, will be always to some extent subjective. We can of course look at institutions. The manorial courts, in which the business of the village was transacted according to customary rights, are often cited as 'communal'. These were, though, steadily decaying before enclosure, and retained only a declining importance until they were superseded by the completed system of propertied rule. The processes of local law and government show the same evolution: a steady concentration of power in the hands of the landowners, and a more evident (if not a more severe) arbitrariness as these came increasingly to represent a conscious national system and interest, in the constitution of the landowners as a political class. The reality of community must then have varied enormously. The detailed record of the Warwickshire village of Tysoe, which we can study in M. K. Ashby's remarkable biography of her father (*Joseph Ashby of Tysoe*, 1961), is a relevant example.

Until the end of the eighteenth century, Tysoe, the registers showed, had been a village of yeomen, craftsmen, tradesmen and a few labourers - not separate classes, but intermarrying, interapprenticed sections of the community, unified by farming in cooperation and by as great mutual dependence in other ways ____ In earlier years the division between classes in Tysoe had been no more than function or custom called for or

worldly perspicacity earned ____ After the years of wretchedness it was so deep a ditch that every foolish mind fell into it.¹⁴

But what is then interesting is that this change, in 'the years of wretchedness', is not the result of enclosure, but had preceded it. The increasing poverty in the village became a system of pauperism, and for this enclosure could not be blamed in Tysoe.

The scarlet letters for paupers were sewn in the 1740s. The entry of 'Pauper' in the burial register became more regular through the eighteenth century, and was eventually shortened to a crude 'P\ Unemployment was registered from the 1780s. The roundsman system was active from the 1760s. The smallpox came recurrently, and the consequences of its heavy toll of lives led to peaks of poor relief in the 1770s. This community, it is clear, was so involved in and exposed to the crises of a general system that its neighbourliness was, at best, relative. The friendly and comparatively informal relief of an earlier period gave way, under just this pressure, to the cold and harsh treatment of a separate class of 'the poor'. At the same time, again before enclosure though increasing after it, there was the more evident class-consciousness of the parsons, as in the new style of vicarage, hedged from 'their' parishioners, and of the more prosperous farmers, now called 'gentlemen-farmers'. Enclosure is then a factor within this complex of change, but not a single isolated cause.

Another thing we can learn is that community must not always be seen in retrospect. In Tysoe there was a revival of community, as the village came together in the nineteenth century, to fight for its rights of allotment in the Town Lands. In many parts of rural Britain, a new kind of community developed as an aspect of struggle, against the dominant landowners or, as in the labourers' revolts in the time of the Swing machine-smashing and rick-burning or in the labourers' unions from Tolpuddle to Joseph Arch, against the whole class-system of rural capitalism. In many villages, community only became a reality when economic and political rights were fought for and partially gained, in the recognition of unions, in the extension of the franchise, and in the possibility of entry into new representative and democratic institutions. In many thousands of cases, there is more community in the modern village, as a result of this process of new legal and democratic rights, than at any point in the recorded or imagined past.

That is active community, and it must be distinguished from another version, which is sometimes the mutuality of the oppressed, at other times the mutuality of people living at the edges or in the margins of a generally oppressive system. This comes out in many ways, overlapping with the community of struggle or persisting as local and traditional habit. One way of considering the survival of this traditional mutuality would be according to the distance of a village from its principal landowner. We have heard so much of the civilising effect of this landowning class, from its own mouth and from the mouths it has hired, that it is worth recording the coming of a more extreme class-consciousness - a systematic shaming of the labourers and the poor - from what were now so often the rebuilt country-houses, and often by way of their attendant and employed clergy. The break of so many poor families from the Church of England into the nonconformist sects is directly related to this experience of landlord-and-parson religion. The barn-chapels of remote rural Britain are still moving witnesses of this radical community response. But the remoteness itself is very often a factor, whether regional or local. It has always seemed to me, from some relevant family experience, that the distance or absence of one of

those 'great houses' of the landlords can be a critical factor in the survival of a traditional kind of community: that of tolerant neighbourliness. Matthew Arnold gave a clue to this when he wrote, in *Culture and Anarchy*:

When I go through the country, and see this and that beautiful and imposing seat of theirs crowning the landscape, 'There,' I say to myself, 'is a great fortified post of the Barbarians.'¹⁵

They had been there, indeed, from periods of direct military rule and occupation; but they had settled into a more social order. And it was in the eighteenth century, most visibly, that these strong points of a class spread in a close network over so much of Britain, with subsidiary effects, on attitudes to landscape and to nature, that we shall come to notice.

But consider, directly, their social effect. Some of them had been there for centuries, visible triumphs over the ruin and labour of others. But the extraordinary phase of extension, rebuilding and enlarging, which occurred in the eighteenth century, represents a spectacular increase in the rate of exploitation: a good deal of it, of course, the profit of trade and of colonial exploitation; much of it, however, the higher surplus value of a new and more efficient mode of production. It is fashionable to admire these extraordinarily numerous houses: the extended manors, the neoclassical mansions, that lie so close in rural Britain. People still pass from village to village, guidebook in hand, to see the next and yet the next example, to look at the stones and the furniture. But stand at any point and look at that land. Look at what those fields, those streams, those woods even today produce. Think it through as labour and see how long and systematic the exploitation and seizure must have been, to rear that many houses, on that scale. See by contrast what any ancient isolated farm, in uncounted generations of labour, has managed to become, by the efforts of any single real family, however prolonged. And then turn and look at what these other 'families', these systematic owners, have accumulated and arrogantly declared. It isn't only that you know, looking at the land and then at the house, how much robbery and fraud there must have been, for so long, to produce that degree of disparity, that barbarous disproportion of scale. The working farms and cottages are so small beside them: what men really raise, by their own efforts or by such portion as is left to them, in the ordinary scale of human achievement. What these 'great' houses do is to break the scale, by an act of will corresponding to their real and systematic exploitation of others. For look at the sites, the facades, the defining avenues and walls, the great iron gates and the guardian lodges. These were chosen for more than the effect from the inside out; where so many admirers, too many of them writers, have stood and shared the view, finding its prospect delightful. They were chosen, also, you now see, for the other effect, from the outside looking in: a visible stamping of power, of displayed wealth and command: a social disproportion which was meant to impress and overawe. Much of the real profit of a more modern agriculture went not into productive investment but into that explicit social declaration: a mutually competitive but still uniform exposition, at every turn, of an established and commanding class power.

To stand in that shadow, even today, is to know what many generations of countrymen bitterly learned and were consciously taught: that these were the families, this the shape of the society. And will you then think of community? You will see

modern community only in the welcome signs of some partial reclamation: the houses returned to some general use, as a hospital or agricultural college. But you are just as likely to see the old kinds of power still declared: in the surviving exploiters and in their modern relations - the corporation country-house, the industrial seat, the ruling-class school. Physically they are there: the explicit forms of the long class-society.

But turn for a moment elsewhere: to the villages that escaped their immediate presence; to the edges, the old commons still preserved in place-names; to the hamlets where control was remote. It can make some difference, as you go about every day, to be out of sight of that explicit command. And this is so, I do not doubt, in many surviving, precarious communities, the dispersed settlements of the west or some of the close villages of the east and midlands, where no immediate house has so outgrown its neighbours that it has visibly altered the scale. It makes a real difference that in day-to-day relations those other people and their commanding statements in stone are absent or at least some welcome distance away.

In some places still, an effective community, of a local kind, can survive in older terms, where small freeholders, tenants, craftsmen and labourers can succeed in being neighbours first and social classes only second. This must never be idealised, for at the points of decision, now as then, the class realities usually show through. But in many intervals, many periods of settlement, there is a kindness, a mutuality, that still manages to flow. It is a matter of degree, as it was in the villages before and after enclosure. When the pressure of a system is great and is increasing, it matters to find a breathing-space, a fortunate distance, from the immediate and visible controls. What was drastically reduced, by enclosures, was just such a breathing-space, a marginal day-to-day independence, for many thousands of people. It is right to mourn that loss but we must also look at it plainly. What happened was not so much 'enclosure' - the method - but the more visible establishment of a long-developing system, which had taken, and was to take, several other forms. The many miles of new fences and walls, the new paper rights, were the formal declaration of where the power now lay. The economic system of landlord, tenant and labourer, which had been extending its hold since the sixteenth century, was now in explicit and assertive control. Community, to survive, had then to change its terms.

Three Around Farnham

In this period of change, it mattered very much where you were looking from. Points of view, interpretations, selections of realities, can now be directly contrasted. In history it is a period of rural society. In literature it is a complex of different ways of seeing even the same local life.

Imagine a journey, for example, round a thirty-mile triangle of roads, in the turning years of the late eighteenth and early nineteenth centuries. It is on the borders of Hampshire and Surrey: six miles from Selborne to Chawton; ten miles from Chawton to Farnham; fourteen miles from Farnham back to Selborne. In 1793, in Selborne, Gilbert White died. In 1777, when White had been keeping his famous journal for nine years, a boy of fourteen, William Cobbett, ran away from his father's small farm at Farnham. Cobbett was to ride back through these villages, many times, and in the 1820s to write his *Rural Rides*. When Gilbert White died, Jane Austen,

not far away, in another parsonage, was beginning to write her novels of country society. From 1809, in Chawton, she was beginning to publish and to write her mature works. In this small locality, overlapping within a generation, there were these three people, three writers, who could hardly be more different. Both the country seen and the idea of the country vary so much in their work that we are forced, as we read them, into a new kind of consciousness.

What Cobbett gives us is detailed social observation, from the point of view of the condition of the majority of men. He combined Arthur Young's attention to the detailed practice of a working agriculture with a more persistent social questioning and observation. Thus in 1821:

(West of Uphusband):

... a group of women labourers, who were attending the measurers to measure their reaping work, presented such an assemblage of rags as I never before saw even amongst the hoppers at Farnham, many of whom are common beggars. I never before saw *country* people, and reapers too, observe, so miserable in appearance as these. There were some very pretty girls, but ragged as colts and as pale as ashes.

(Near Cricklade):

... The labourers seem miserably poor. Their dwellings are little better than pig-beds, and their looks indicate that their food is not nearly equal to that of a pig. Their wretched hovels are stuck upon little bits of ground *on the road side*, where the space has been wider than the road demanded. In many places they have not two rods to a hovel. It seems as if they had been swept off the fields by a hurricane, and had found shelter under the banks on the road side! Yesterday morning was a sharp frost; and this had set the poor creatures to digging up their little plots of potatoes _____. And this is 'prosperity', is it?¹

The great merit of Cobbett's observation is its detail. This included the facts of local variation:

(Near Gloucester):

... The labourers' dwellings, as I came along, looked good, and the labourers themselves pretty well as to dress and healthiness. The girls at work in the fields (always my standard) are not in rags, with bits of shoes tied on their feet and rags tied round their ankles, as they had in Wiltshire.

This is a new voice, in a radical shift of social viewpoint:

The landlords and the farmers can tell their own tale. They tell their own tale in remonstrances and prayers, addressed to the House. Nobody tells the tale of the labourer.¹⁷

This consciousness of viewpoint, of a class viewpoint, marks the distance from most previous accounts; and where Cobbett had been preceded, as in part by Crabbe, the range of detail brings in a world that marks the essential preparation for transition from the sympathetic poem to the realistic novel.

We remember Crabbe as we see Cobbett considering the relations between poverty and the quality of land:

(In Kent):

What a difference between the wife of a labouring man here, and the wife of a labouring man in the forests and woodlands of Hampshire and Sussex! Invariably have I observed that the richer the soil, and the more destitute of woods; that is to say, the more purely a corn country, the more miserable the labourers.

It was in the cornlands that capitalist farming was most developed. It is on this contrast of social conditions that Cobbett insists:

The labouring people look pretty well. They have pigs. They invariably do best in the *woodland* and *forest* and *wild* countries. Where the mighty grasper has *all under his eye*, they can get but little.

This was the social basis of his opposition to enclosures: not what happened to production, as a total figure, but what happened, in detail, to the people and the land. It was in this sense that he observed:

This place presents another proof of the truth of my old observation: *rich land* and *poor labourers*.

Or again, comparing the disadvantage of wage-labour with the old system of feeding and lodging (the farmers 'cannot keep their work-people *upon so little* as they give them in wages'), he insisted:

The land produces, on an average, what it always produced, but there is a new distribution of the produce.

What was happening meanwhile to the landowners, and to their social structure, as rural capitalism extended? Cobbett looked very carefully at this, and made a familiar distinction between

a resident *native* gentry, attached to the soil, known to every farmer and labourer from his childhood, frequently mixing with them in those pursuits where all artificial distinctions are lost, practising hospitality without ceremony, from habit and not on calculation; and a gentry, only now-and-then residing at all, having no relish for country-delights, foreign in their manners, distant and haughty in their behaviour, looking to the soil only for its rents, viewing it as a mere object of speculation, unacquainted with its cultivators, despising them and their pursuits, and relying, for influence, not upon the good will of the vicinage, but upon the dread of their power. The war and paper-system has brought in nabobs, negro-drivers, generals, admirals, governors, commissaries, contractors, pensioners, sinecurists, commissioners, loan-jobbers, lottery-dealers, bankers, stock-jobbers; not to mention the long and *black list* in gowns and three-tailed wigs. You can see but few good houses not in possession of one or the other of these. These, with the parsons, are now the magistrates.

It is an impressive list and Cobbett gives several names as examples. The fact that there had been the same kind of invasion, from at least the sixteenth century, must qualify the account. What Cobbett does not ask is where the 'invaders' came from. Many of them, in fact, were the younger sons of that same 'resident native gentry', who had gone out to these new ways to wealth, and were now coming back. Yet,

'native' or 'invader', the pressure on rents, and so through the tenant-farmer on the labourer, was visibly and dramatically increasing. Cobbett shortens the real time-scale, but then sees what is happening, as agrarian capitalism extends. He identifies money - first silver and gold, and then paper - as the agent of change. At first:

its consequences came on by slow *degrees*; it made a transfer of property, but it made that transfer in so small a degree, and it left the property quiet in the hands of the new possessor for so long a time, that the effect was not violent, and was not, at any rate, such as to uproot possessors by whole districts, as the hurricane uproots the forests.

This is an under-estimate of change from the sixteenth to eighteenth centuries, but what Cobbett is intent to record is the visible disturbance of his own time:

the *small gentry*, to about the *third* rank upwards (considering there to be five ranks from the smallest gentry up to the greatest nobility) are *all gone*, nearly to a man, and the small farmers along with them. The Barings alone have, I should think, swallowed up thirty or forty of these small gentry without perceiving it. They, indeed, swallow up the biggest race of all; but innumerable small fry slip down unperceived, like caplins down the throats of the sharks, while these latter only the cod-fish.

As clearly as anyone in the whole record Cobbett raises the familiar complaint about the reduction of intermediate classes in the rural economy. But while he sees this happening, he simultaneously introduces a new criterion of judgement. Identifying with the labourer, making 'always my standard' the girls at work in the fields, Cobbett sees the ruin of the small owners and some tenant farmers, but then says of the small gentry, with a new harshness:

So that, while they have been the active, the zealous, the efficient instruments, in compelling the working classes to submit to half-starvation, they have at any rate been brought to the most abject ruin themselves: for which I most heartily thank God.

Or again, of the farmers:

Here is much more than enough to make me rejoice in the ruin of the farmers; and I do, with all my heart, thank God for it; seeing that it appears absolutely necessary, that the present race of them should be totally broken up, in Sussex at any rate, in order to put an end to this cruelty and insolence towards the labourers, who are by far the greater number.

This is the hard anger which Cobbett shared with many of the labourers of his time, against the nearest targets to hand. It is the mood of the Bread or Blood riots of East Anglia in 1816, or of the widespread revolt of the labourers - the campaigns of 'Captain Swing' - in 1830. Cobbett noticed, in this, that he might have 'laid on the lash without a due regard to many', and he reflected:

Born in a farm-house, bred up at the plough-tail, with a smock-frock on my back, taking great delight in all the pursuits of farmers, liking their society, and having amongst them my most esteemed friends, it is natural that I should feel, and I do feel, uncommonly anxious to prevent, as far as I am able, that total ruin which now menaces

them. But the labourer, was I to have no feeling for him? Was he not my *countryman* too? And was I not to feel indignation against those farmers, who had had the hard-heartedness to put the bell round his neck, and thus wantonly insult and degrade the class to whose toils they owed their own ease?

This conflict of loyalties, and yet the final determination, marks a crucial stage. It was often the case in the forced food-levies, the riots for a minimum wage, the rick-burnings, that the immediate targets, the farmers, had little enough to give, under the pressure for rents of the more safely removed and protected landowners. It is significant indeed that, in these disturbances, dispossessed and ruined and hard-pressed farmers often joined the rioting labourers. But this was the characteristic of a developing capitalist order in the land. The riots indeed mark the last stage of the *local* confrontation, in immediate and personal terms. Such disturbances had necessarily to be succeeded by the organisation of class against class, in trade unionism and in its associated political movements. The structure of feeling that had held in direct appeal and in internal moral discrimination - the moral case, the moral warning, of such verse as Goldsmith's or Crabbe's - was now necessarily transformed into a different order of thinking and feeling. The maturity of capitalism as a system was forcing systematic organisation against it.

This development, so crucial in the social history of rural England, has its consequence in a new kind of country writing, of which Cobbett is the outrider: a change of convention, so that the interaction of classes, now the decisive history, can begin to be described: no longer in reflection, but in a newly typical action. This is the crucial bearing of the transformation of fiction into a new kind of novel, which was to become, from the 1830s, the dominant literary form. Cobbett described and campaigned, as a reporter and finally as a tribune. His change of viewpoint, and the changes to which he so vividly responded, are the first important signs of a new method in literature.

But this change in the novel did not happen in Cobbett's time. Through his middle years, while the social changes were happening, Jane Austen was writing from a very different point of view, from inside the houses that Cobbett was passing on the road. When he was writing about the disappearance of the small gentry he was riding through Hampshire, not far from Chawton. It was also in Hampshire that he made his list of the new owners of country-houses and estates, from nabobs to stock-jobbers. We can find ourselves thinking of Jane Austen's fictional world, as he goes on to observe:

The big, in order to save themselves from being '*swallowed up quick*'... make use of their *voices* to get, through place, pension, or sinecure, something back from the taxes. Others of them *fall in love* with the *daughters* and *widows* of paper-money people, big brewers, and the like; and sometimes their daughters *fall in love* with the paper-money people's sons, or the fathers of those sons; and whether they be Jews, or not, seems to be little matter with this all-subduing passion of love. But the *small gentry* have no resource.

This is a very different tone from anything that Jane Austen wrote, but it forces us to ask, as it were from the other side of the park wall: what were the conditions and the pressures within which she brought to bear her no less sharp observation; what was the social substance of her precise and inquiring personal and moral emphases?

It is a truth universally acknowledged, that Jane Austen chose to ignore the decisive historical events of her time. Where, it is still asked, are the Napoleonic wars: the real current of history? But history has many currents, and the social history of the landed families, at that time in England, was among the most important. As we sense its real processes, we find that they are quite central and structural in Jane Austen's novels. All that prevents us from realising this is that familiar kind of retrospect, taking in *Penshurst* and *Saxham* and *Buck's Head* and *Mansfield Park* and *Norland* and even *Poynton*, in which all country houses and their families are seen as belonging, effectively, to a single tradition: that of the cultivated rural gentry. The continual making and remaking of these houses and their families is suppressed, in this view, for an idealising abstraction, and Jane Austen's world can then be taken for granted, even sometimes patronised as a rural backwater, as if it were a simple 'traditional' setting. And then if the social 'background' is in this sense 'settled', we can move to an emphasis on a fiction of purely personal relationships.

But such an emphasis is false, for it is not personal relationships, in the abstracted sense of an observed psychological process, that preoccupy Jane Austen. It is, rather, personal *conduct*: a testing and discovery of the standards which govern human behaviour in certain real situations. To the social considerations already implicit in the examination of conduct, with its strong sense and exploration of the adequacy of social norms, we must add, from the evidence of the novels, a direct preoccupation with estates, incomes and social position, which are seen as indispensable elements of all the relationships that are projected and formed. Nor is this a preoccupation within a settled 'traditional' world; indeed much of the interest, and many of the sources of the action, in Jane Austen's novels, lie in the changes of fortune—the facts of general change and of a certain mobility—which were affecting the landed families at this time.

Thus it would be easy to take Sir Thomas Bertram, in *Mansfield Park*, as an example of the old settled landed gentry, to be contrasted with the new 'London' ways of the Crawfords (this is a common reading), were it not for the fact that Bertram is explicitly presented as what Goldsmith would have called 'a great West Indian': a colonial proprietor in the sugar island of Antigua. The Crawfords may have London ways, but the income to support them is landed property in Norfolk, and they have been brought up by an uncle who is an admiral. Sir Walter Elliott, in *Persuasion*, belongs to a landed family which had moved from Cheshire to Somerset, and which had been raised to a baronetcy in the Restoration, but his income, at this time, will not support his position; his heir-presumptive has 'purchased independence by uniting himself to a rich woman of inferior birth'; and the baronet is forced to let Kellynch Hall to an admiral, since, as his lawyer observes:

This peace will be turning all our rich naval officers ashore. They will be all wanting a home __ Many a noble fortune has been made during the war.

The neighbouring Musgroves, the second landowning family, are, by contrast,

in a state of alteration, perhaps of improvement. The father and mother were in the old English style, and the young people in the new.²²

Darcy, in *Pride and Prejudice*, is a landowner established for 'many generations', but his friend Bingley has inherited £100,000 and is looking for an estate to purchase. Sir

William Lucas has risen from trade to a knighthood; Mr Bennett has £2000 a year, but an entailed estate, and has married the daughter of an attorney, whose brother is in trade. Knightley, in *Emma*, owns Donwell Abbey, and Martin, one of the new gentlemen farmers, is his tenant. The Woodhouses have little land but Emma will inherit £30,000, 'from other sources'. Elton, the vicar, has some independent property, but must make his way as he could, 'without any alliances but in trade'. Mr Weston belongs to a 'respectable family which for the last two or three generations had been rising into gentility and property'; he marries, through the militia, the daughter of 'a great Yorkshire family', and when she dies enters trade and purchases 'a little estate'. Harriet, finally revealed as the daughter of 'a tradesman, rich enough' marries her gentleman-farmer with the reasonable 'hope of more, of security, stability, and improvement'. The Coles live quietly, on an income from trade, but when this improves become 'in fortune and style of living, second only to the Woodhouses, in the immediate neighbourhood'. In *Sense and Sensibility*, the Dashwoods are a settled landowning family, increasing their income by marriages, and enlarging the settlements of their daughters; they are also enclosing Norland Common, and buying up neighbouring farms; the necessary cashing of stocks for enclosure and engrossing affect the rate of the family's immediate improvement. In *Northanger Abbey*, Catherine Morland, the daughter of a clergyman with two good livings and a considerable independence, goes with a local landowning family, the Aliens, to Bath, and in that sharply observed social exchange meets the son of the family which has owned the Abbey estates since the dissolution of the monasteries; his sister has married on the 'unexpected accession' of her lover 'to title and fortune'.

To abstract this social history is of course to describe only the world of the novels within which the more particular actions begin and end. Yet it must be clear that it is no single, settled society, it is an active, complicated, sharply speculative process. It is indeed that most difficult world to describe, in English social history: an acquisitive, high bourgeois society at the point of its most evident interlocking with an agrarian capitalism that is itself mediated by inherited titles and by the making of family names. Into the long and complicated interaction of landed and trading capital, the process that Cobbett observed - the arrival of 'the nabobs, negro-drivers, admirals, generals' and so on - is directly inserted, and is even taken for granted. The social confusions and contradictions of this complicated process are then the true source of many of the problems of human conduct and valuation, which the personal actions dramatise. An openly acquisitive society, which is concerned also with the transmission of wealth, is trying to judge itself at once by an inherited code and by the morality of improvement.

The paradox of Jane Austen is then the achievement of a unity of tone, of a settled and remarkably confident way of seeing and judging, in the chronicle of confusion and change. She is precise and candid, but in very particular ways. She is, for example, more exact about income, which is disposable, than about acres, which have to be worked. Yet at the same time she sees land in a way that she does not see 'other sources' of income. Her eye for a house, for timber, for the details of improvement, is quick, accurate, monetary. Yet money of other kinds, from the trading houses, from the colonial plantations, has no visual equivalent; it has to be converted to these signs of order to be recognised at all. This way of seeing is especially representative. The land is seen primarily as an index of revenue and position; its visible order and control are a valued product, while the process of working it is

hardly seen at all. Jane Austen then reminds us, yet again, of the two meanings of improvement, which were historically linked but in practice so often contradictory. There is the improvement of soil, stock, yields, in a working agriculture. And there is the improvement of houses, parks, artificial landscapes, which absorbed so much of the actually increasing wealth. Professor Habakkuk has observed that

English landowners as a whole were a class of consumers, and the greater parts of their borrowings were contracted for non-productive purposes, to provide dowries, to fund short-term debts contracted as a result of extravagant living, to build mansions; the borrowings for enclosures, for example, were usually a small part of total indebtedness.²⁴¹

This is not to deny the function of many landowners in agricultural improvement, but to set it in its actual social context. It is the essential commentary on what can be abstracted, technically, as the agricultural revolution: that it was no revolution, but the consolidation, the improvement, the expansion of an existing social class.

Cultivation has the same ambiguity as improvement: there is increased growth, and this is converted into rents; and then the rents are converted into what is seen as a cultivated society. What the 'revolution' is for, then, is this: this apparently attainable quality of life. Jane Austen could achieve her remarkable unity of tone - that cool and controlled observation which is the basis of her narrative method; that lightly distanced management of event and description and character which need not become either open manipulation or direct participation - because of an effective underlying and yet unseen formula: improvement is or ought to be improvement. The working improvement, which is not seen at all, is the means to social improvement, which is then so isolated that it is seen very clearly indeed.

It is not seen flatteringly. The conversion of good income into good conduct was no automatic process. Some of the conscious improvers are seen as they were: greedy and calculating materialists. But what is crucial is that the moral pretension is taken so seriously that it becomes a critique: never of the basis of the formula, but coolly and determinedly of its results, in character and action. She guides her heroines, steadily, to the right marriages. She makes settlements, alone, against all the odds, like some supernatural lawyer, in terms of that exact proportion to moral worth which could assure the continuity of the general formula. But within this conventional bearing, which is the source of her confidence, the moral discrimination is so insistent that it can be taken, in effect, as an independent value. It is often said, by literary historians, that she derives from Fielding and from Richardson, but Fielding's genial manipulative bluff and Richardson's isolating fanaticism are in fact far back, in another world. What happens in *Emma*, in *Persuasion*, in *Mansfield Park*, is the development of an everyday, uncompromising morality which is in the end separable from its social basis and which, in other hands, can be turned against it. It is in this sense that Jane Austen relates to the Victorian moralists, who had to learn to assume, with increasing unease from Coleridge to George Eliot and Matthew Arnold, that there was no necessary correspondence between class and morality; that the survival of discrimination depended on another kind of independence; that the two meanings of improvement had to be not merely distinguished but contrasted; or, as first in Coleridge, that cultivation, in its human sense, had to be brought to bear as a standard *against* the social process of civilisation. In these hands, decisively, the

formula broke down: improvement was not improvement; not only not necessarily, but at times in definite contradiction. Jane Austen, it is clear, never went so far; her novels would have been very different, involving new problems of structure and language, if she had. But she provided the emphasis which had only to be taken outside the park walls, into a different social experience, to become not a moral but a social criticism. It is this transformation, and its difficulties, that we shall meet in George Eliot.

We must here emphasise again the importance of Cobbett. What he names, riding past on the road, are classes. Jane Austen, from inside the houses, can never see that, for all the intricacy of her social description. All her discrimination is, understandably, internal and exclusive. She is concerned with the conduct of people who, in the complications of improvement, are repeatedly trying to make themselves into a class. But where only one class is seen, no classes are seen. Her people are selected though typical individuals, living well or badly within a close social dimension. Cobbett never, of course, saw them as closely or as finely; but what he saw was what they had in common: the underlying economic process. A moral view of that kind had to come from outside, and of course when it came the language was rougher and harder. The precise confidence of an established world gave way to disturbing, aggressive and conflicting voices.

It was not a new experience; it had been there all the time, but only rarely recorded:

We are men formed in Christ's likeness, and we are kept like beasts.

For Toils scarce ever ceasing press us now;
Rest never does, but on the Sabbath, show;
And barely that our Masters will allow.

Here I am, between Earth and Sky .- so help me God. I would sooner lose my life than go home as I am. Bread I want and Bread I will have.

What we have done now is Soar against our Will but your harts is so hard as the hart of Pharo _ So now as for this fire you must not take it as a front, for if you hadent been Deserving it wee should not have dont.

The first voice is from the fourteenth century; the second from the early eighteenth; the third and fourth from the early nineteenth century, in a new general crisis. It is a radically different morality from that of Jane Austen, but it is insistently moral, in its own general language. It is the voice of men who have seen their children starving, and now within sight of the stately homes and the improved parks and the self-absorbed social patterns at the ends of the drives.

Cobbett and Jane Austen mark two ways of seeing, two contrasted viewpoints, within the same country. Each kind of observation, however, is social, in the widest sense. But as we make our imaginary journey, on that triangle of roads, we discover, in Gilbert White, a different kind of observation, yet one of no less significance in the development of country writing. Anyone who lives in the country can experience at times, or seem to experience, an unmediated nature: in a direct and physical awareness of trees, birds, the moving shapes of land. What is new in Gilbert White, or at least feels new in its sustained intensity, is a development from this;

a single and dedicated observation, as if the only relationships of country living were to its physical facts. It is a new kind of record, not only of the facts, but of a way of looking at the facts: a way of looking that will come to be called scientific:

The next bird that I procured (on the 21st of May) was a male red-backed butcher-bird, *lanius collurio*. My neighbour, who shot it, says that it might easily have escaped his notice, had not the outcries and chattering of the white-throats and other small birds drawn his attention to the bush where it was: its crow was filled with the legs and wings of beetles...

... The ousel is larger than a blackbird, and feeds on haws; but last autumn (when there were no haws) it fed on yew-berries: in the spring it feeds on ivy-berries, which ripen only at that season, in March and April.

These descriptions are from the formal letters published in *The Natural History of Selborne*. In tone and attention, over a lifetime, they compose a new kind of writing. It is not that White lacked what can be called 'powers of description'. When a natural event included an emotional response, as in the fearful summer of 1783, he could write to its level:

The sun, at noon, looked as blank as a clouded moon, and shed a rust-coloured ferruginous light on the ground, and floors of rooms; but was particularly lurid and blood-coloured at rising and setting. All the time the heat was so intense that butchers' meat could hardly be eaten on the day after it was killed; and the flies swarmed so in the lanes and hedges that they rendered the horses half frantic, and riding irksome.

It is simply, as the reading of his *Journal* over twenty-five years from 1768 to 1793 will confirm, that his customary mode of attention was outward: observing, inquiring, annotating, classifying. The quality of his feeling for the life around him is unquestionable; it is the devoted and delighted attention of a lifetime, from which anybody living in the country can still learn. But it is not what can easily be confused with it from many earlier and some later observations, the working of particular social or personal experience into the intricacies of things seen. White may remind us at times of Arthur Young and the other contributors to the *Annals of Agriculture*, in the close and detailed precision of his notes and observations. But what he is observing is not a working agriculture, except incidentally; it is a natural order, in a new sense: a physical world of creatures and conditions. While Cobbett and Jane Austen, in their different ways, were absorbed in a human world, Gilbert White was watching the turn of the year and the myriad physical lives inside it: nature in a sense that could now be separated from man.

It is a complicated change, and we must try to see its relation to a whole set of other changes which, through the eighteenth century, and then again in the generation of Cobbett and Jane Austen but in quite different ways, were bringing about a transformation of attitudes and feelings towards observed nature: new kinds of interest in landscape, a new self-consciousness of the picturesque, and beyond these and interacting with the more social observations, the new language, the new poetry, of Wordsworth and Clare.

Witness Against the Beast

E. P. Thompson

E. P. Thompson was one of the major figures in English history writing during the last half of the twentieth century. His work, especially *The Making of the English Working Class* (1966), was notable for its engagement with the culture that shaped people's actions in the social and political arena. In this selection from his book *Witness Against the Beast* (1993), he brings his thorough knowledge of the social movements in English history in the seventeenth and eighteenth centuries to bear in a reading of William Blake's "London." He traces out philosophical roots for the words in the poem.

'London'

'London' is among the most lucid and instantly available of the *Songs of Experience*. 'The poem', John Beer writes, 'is perhaps the least controversial of all Blake's works', and 'no knowledge of his personal vision is necessary to assist the understanding'.¹ I agree with this: the poem does not require an interpreter since the images are self-sufficient within the terms of the poem's own development. Every reader can, without the help of a critic, see London simultaneously as Blake's own city, as an image of the state of English society and as an image of the human condition. So far from requiring a knowledge of Blake's personal vision it is one of those foundation poems upon which our knowledge of that vision can be built. A close reading may confirm, but is likely to add very little to, what a responsive reader had already experienced.

But since the poem is found in draft in Blake's notebook we are unusually well placed to examine it not only as product but in its process of creation. Here is the finished poem:

I wander thro' each charter'd street, Near
where the charter'd Thames does flow. And
mark in every face I meet Marks of weakness,
marks of woe.

In every cry of every Man, In
every Infants cry of fear, In every
voice: in every ban, The mind-
forg'd manacles I hear

How the Chimney-sweepers cry
Every blackning Church appalls,

And the hapless Soldiers sigh,
Runs in blood down Palace walls

But most thro' midnight streets I hear How
the youthful Harlots curse Blasts the new-
born Infants tear And blights with plagues the
Marriage hearse

(E26-7)

In Blake's draft the first verse was originally thus:

I wander thro each dirty street Near where
the dirty Thames does flow And see in
every face I meet Marks of weakness
marks of woe

The first important change is from 'dirty' to 'charter'd'. Another fragment in the notebook helps to define this alteration:

Why should I care for the men of thames Or
the cheating waves of charter'd streams Or
shrink at the little blasts of fear That the
hireling blows into my ear

Tho born on the cheating banks of Thames
Tho his waters bathed my infant limbs The
Ohio shall wash his stains from me I was born
a slave but I go to be free

Thus 'charter'd' arose in Blake's mind in association with 'cheating' and with the 'little blasts of fear' of the 'hireling'. The second association is an obvious political allusion. To reformers the corrupt political system was a refuge for hirelings: indeed, Dr Johnson had defined in his dictionary a 'pension' as 'In England it is generally understood to mean pay given to a state hireling for treason to his country.' David Erdman is undoubtedly right that the 'little blasts of fear' suggest the proclamations, the Paine-burnings and the political repressions of the State and of Reeves' Association for Preserving Liberty and Property against Republicans and Levellers which dominated the year in which these poems were written. In the revised version of 'Thames' Blake introduces the paradox which was continually to be in the mouths of radicals and factory reformers in the next fifty years: the slavery of the English poor. And he points also ('I was born a slave but I go to be free') to the first wave of emigration of reformers from the attention of Church-and-King mobs or hirelings.

But 'charter'd' is more particularly associated with 'cheating'. It is clearly a word to be associated with commerce: one might think of the Chartered Companies which, increasingly drained of function, were bastions of privilege within the government of the city. Or, again, one might think of the monopolistic privileges of the East India Company, whose ships were so prominent in the commerce of the Thames, which applied in 1793 for twenty-years' renewal of its charter, and which was under bitter attack in the reformers' press.

But 'charter'd' is, for Blake, a stronger and more complex word than that, which he endows with more generalised symbolic power. It has the feel of a word which Blake has recently discovered, as, years later, he was to 'discover' the word 'golden' (which, nevertheless, he had been using for years). He is savouring it, weighing its poetic possibilities in his hand. It is in no sense a 'new' word, but he has found a way to use it with a new ironic inversion. For the word is standing at an intellectual and political crossroads. On the one hand, it was a stale counter of the customary libertarian rhetoric of the polite culture. Blake himself had used it in much this way in his early 'King Edward the Third':

Let Liberty, the charter'd right of Englishmen,
Won by our fathers in many a glorious field,
Enerve my soldiers; let Liberty
Blaze in each countenance, and fire the battle.
The enemy fight in chains, invisible chains, but heavy;
Their minds are fetter'd; then how can they be free?

It would be only boring to accumulate endless examples from eighteenth-century constitutional rhetoric or poetry of the use of chartered rights, chartered liberties, magna carta: the word is at the centre of Whig ideology.

There is, however, an obvious point to be made about this tedious usage of 'charter'. A charter of liberty is, simultaneously, a denial of these liberties to others. A charter is something given or ceded; it is bestowed upon some group by some authority; it is not claimed as of right. And the liberties (or privileges) granted to this guild, company, corporation or even nation *exclude* others from the enjoyment of these liberties. A charter is, in its nature, exclusive.

We are at a crossroads because it is exactly this exclusive and granted quality of liberties which was under challenge; and it was under challenge from the claim to universal rights. The point becomes clear when we contrast Burke's *Reflections* and Paine's *Rights of Man*. Although Burke was every inch a rhetorician he had no taste for stale rhetoric, and he used the word 'charter' lightly in the *Reflections*. 'Our oldest reformation', he wrote, 'is that of Magna Charta':

From Magna Charta to the Declaration of Right it has been the uniform policy of our constitution to claim and assert our liberties as an *entailed inheritance* derived to us from our forefathers, and to be transmitted to our posterity...

We have an inheritable crown, an inheritable peerage, and a House of Commons and a people inheriting privileges, franchises, and liberties from a long line of ancestors.

Burke was concerned explicitly to define this chartered, heritable set of liberties and privileges (exclusive in the sense that it is 'an estate specially belonging to the people of this kingdom') as against any general uncircumscribed notion of 'the rights of man'. It is in vain, he wrote, to talk to these democratists:

of the practice of their ancestors, the fundamental laws of their country... They have wrought underground a mine that will blow up, at one grand explosion, all examples of antiquity, all precedents, charters, and acts of parliament. They have 'the rights of men'. Against these there can be no prescription...

Liberty, for Burke, must have its 'gallery of portraits, its monumental inscriptions, its records, evidences, and titles'. The imagery, as so often, is that of the great house of the landed gentry, with its walks and statuary, its galleries and muniments' room.

For Burke, then, 'charter' and 'charter'd', while not over-laboured, remain among the best of good words. But not for Paine: 'I am contending for the rights of the *living*, and against their being willed away, and controuled and contracted for, by the manuscript assumed authority of the dead.' A charter implied not a freedom but monopoly: 'Every chartered town is an aristocratical monopoly in itself, and the qualifications of electors proceeds out of those chartered monopolies. Is this freedom? Is this what Mr Burke means by a constitution?' It was in the incorporated towns, with their charters, that the Test and Corporation Acts against Dissenters operated with most effect. Hence (Paine argued - and economic historians have often agreed with him) the vitality of the commerce of un-incorporated towns like Manchester, Birmingham and Sheffield. The Dissenters (he wrote), 'withdrew from the persecution of the chartered towns, where test laws more particularly operate, and established a sort of asylum for themselves in those places... But the case is now changing. France and America bid all comers welcome, and initiate them into all the rights of citizenship.'

This is (for Paine) the first offence of 'chartered': it implies exclusion and limitation. Its second offence was in its imputation that anyone had the right to *grant* freedoms or privileges to other men: 'If we begin with William of Normandy, we find that the government of England was originally a tyranny, founded on an invasion and conquest of the country... Magna Carta... was no more than compelling the government to renounce a part of its assumptions.' Both these offences were criticised in a central passage which I argue lay somewhere in Blake's mind when he selected the word:

It is a perversion of terms to say that a charter gives rights. It operates by a contrary effect - that of taking rights away. Rights are inherently in all the inhabitants; but charters, by annulling those rights in the majority, leave the right, by exclusion, in the hands of a few... The only persons on whom they operate are the persons whom they exclude... Therefore, all charters have no other than an indirect negative operation.

Charters, he continued, 'are sources of endless contentions in the places where they exist, and they lessen the common rights of national society'. The charters of corporate towns might, he suggested, have arisen because of garrison service: 'Their refusing or granting admission to strangers, which has produced the custom of *giving, selling and buying freedom*, has more of the nature of garrison authority than civil government' (my emphasis).

Blake by now had come to share much of Paine's political outlook, although he did not share his faith in the beneficence of commerce. He thus chose 'charter'd' out of the biggest political argument that was agitating Britain in 1791-3, and he chose it with that irony which inverted the rhetoric of Burke and asserted the definitions of 'exclusion', the annulling of rights, 'negative operation' and 'giving, selling and buying freedom'. The adjectival form - charter'd - enforces the direct commercial allusion: 'the organisation of a city in terms of trade'.

The other emendation to the first verse is trivial: in the third line 'And see in every face I meet' is altered to 'And mark...' And yet, is it as trivial as it seems? For

we already have, in the fourth line, 'Marks of weakness marks of woe'. Thus Blake has chosen, with deliberation, the triple beat of 'mark'. And we respond to this, whether we are conscious of the nature of the response or whether the words beat upon us in subliminal ways: even in these biblically illiterate days we have all heard of 'the mark of the Beast'. Some of Blake's central images - his trees, and clouds, and caves, and serpents, and roots - have such a universal presence in mythology and literature that one may spend half a lifetime in the game of hunt-the-source. And sometimes the hunting is fruitful, provided that we remember always that the source (or its echo in Blake's mind) is not the same thing as what he makes of it in his own art. Miss Kathleen Raine, a Diana among hunters, has found this:

The opening lines of *London* suggest very strongly Vergil's account of the damned in Hades:

Nor Death itself can wholly wash their Stains; But
long-contracted Filth ev'n in the Soul remains. The
Reliques of inveterate Vice they wear; And spots of Sin
obscene in ev'ry Face appear.⁸

The suggestion need not be excluded; this echo, with others, could have been in Blake's mind. But if so, *what does Blake do with it*? For Blake's poem evokes pity and forgiveness - the cries, the 'hapless Soldiers sigh', 'weakness' and 'woe' - and not the self-righteous eviction to Hades of 'long-contracted Filth', 'inveterate Vice' and 'spots of Sin obscene'. Moreover, in the amendment from 'And see' to 'And mark', Blake (or the speaker of his poem) closes the gap between the censorious observer and the faces which are observed, assimilating both within a common predicament: the marker himself appears to be marked or even to be markmg.

But 'mark' undoubtedly came through to the reader with a much stronger, biblical resonance. The immediate allusion called to mind will most probably have been 'the mark of the Beast', as in Revelation xiii. 16-17:

And he causeth all, both small and great, rich and poor, free and bond, to receive a mark in their right hand, or in their foreheads:

And that no man might buy or sell, save he that had the mark, or the name of the Beast, or the number of his name.

The mark of the Beast would seem, like 'charter'd', to have something to do with the buying and selling of human values.

This question is incapable of any final proof. The suggestion has been made that Blake's allusion is not to Revelation but to Ezekiel ix.4: 'And the Lord said unto him, Go through the midst of the city, through the midst of Jerusalem, and set a mark upon the foreheads of the men that sigh and that cry for all the abominations that be done in the midst thereof.' The man who is ordered to go through the city has 'a writer's inkhorn by his side'. This seems at first to fit the poem closely: in 'London' a writer goes through the city of abominations and listens to 'sighs' and 'cries'. But even a literal reading does not fit the poem's meaning. For Blake - or the T of his poem - is not setting marks on foreheads, he is observing them; and the marks are those of weakness and of woe, not of lamentations over abominations. Moreover, in Ezekiel's vision the Lord then orders armed men to go through the city and to 'slay utterly old and young, both maids and little children, and women: but come not near

any man upon whom is the mark...' Thus those who are marked are set apart and saved. Neither the intention nor the tone of Blake's poem coincides with Ezekiel's unedifying vision. Nor are we entitled to conflate the allusions to Revelation and to Ezekiel with some gesture towards an ulterior 'ambivalence' in which Blake has assimilated the damned to the elect. For if one point is incontestable about this poem it is that *every* man is marked: *all* share this human condition: whereas with Ezekiel it is the great wwmrked majority who are to be put to the sword. Such a conflation offers temptations to a critic but it would destroy the poem by introducing into its heart a direct contradiction of intention and of feeling. Ambiguities of this dimension are not fruitful multipliers of meaning.

There is, further, the question of what response the word 'mark' is most likely to have called up among Blake's contemporaries. I must assert that the allusions called first to mind will have been either to the 'mark of Cain' (Genesis iv.15) or to the 'mark of the Beast' in Revelation. And the more radical the audience, the more preoccupied it will have been with the second. For generations radical Dissent had sermonised and pamphleteered against the Beast (Antichrist) who has had servitors 'which worshipped his image' (Revelation xvi.2): social radicalism equated these with usurers, with the rich, with those successful in buying and selling. And interpreters of Revelation always fastened with fascination upon the enigmatic verse (xiii.18): 'Let him that hath understanding count the number of the Beast: for it is the number of a man.' Such interest in millennial interpretation became rife once more in the 1790s; it turned above all on these chapters of Revelation with their recurrent images of the Beast and of the destruction of Babylon, and the humble were able to turn to their own account the imprecations against kings, false prophets and the rich with which these chapters are rife. We hardly need to argue that Blake, like most radical Dissenters of his time, had saturated his imagination with the imagery of Revelation: chapter xiv (the Son of Man with the sickle, and the Last Vintage) is implanted in the structure of *Vala* and of *Jerusalem*.

These considerations, which are ones of cultural context rather than of superficial verbal similarities, lead me to reject the suggested allusion to Ezekiel. What Blake's contemporaries were arguing about in the 1790s was the rule of Antichrist and the hope of the millennium: the mark seen in 'every face' is the mark of the Beast, a mark explicitly associated with commercialism. And if we require conclusive evidence that Blake was thinking, in 'London', of Revelation, he has given us this evidence himself, with unusual explicitness. For the illumination to the poem appears to be an independent, but complementary, conception; and for this reason I feel entitled to discuss the poem also as an independent conception and within its own terms. The illumination (if I am pressed to confess my own view) adds nothing essential to the poem, but comments upon the same theme in different terms. Nor are we even certain how the poem and the illumination are united, nor why they complement each other, until we turn to *Jerusalem*, Book 4 (E241):

I see London blind & age-bent begging thro the Streets
Of Babylon, led by child, his tears run down his beard

In both the poem and the illumination, London's streets appear as those of Babylon of Revelation; but in the illumination it is London himself who is wandering through them.¹³

In the second verse the important change is from 'german forg'd links' to 'mind-forg'd manacles'. The reference was, of course, to the Hanoverian monarchy, and perhaps to the expectation that Hanoverian troops would be used against British reformers. The change to 'mind-forg'd' both generalises and also places us again in that universe of Blakean symbolism in which we must turn from one poem to another for cumulative elucidation. In this case we have already noted that the image of the mind as 'fettered' by the invisible chains of its own unfreedom had appealed to Blake in his youthful 'King Edward the Third'. The development of the image is shown in another fragment in the notebook, 'How to know Love from Deceit':

Love to faults is always blind
 Always is to joy inclin'd
 Lawless wing'd & unconfin'd
 And breaks all chains from every mind
 Deceit to secrecy confin'd
 Lawful cautious & refin'd
 To every thing but interest blind
 And forges fetters for the mind

The 'mind-forg'd manacles', then, are those of deceit, self-interest, absence of love, of law, repression and hypocrisy. They are stronger and harder to break than the manacles of the German king and his mercenaries, since they bind the minds not only of the oppressors but also of the oppressed; moreover, they are self-forged. How then are we to read 'ban'? F. W. Bateson, a confident critic, tells us 'in every execration or curse (*not* in every prohibition)'. I can't share his confidence: one must be prepared for seventeen types of ambiguity in Blake, and, in any case, the distinction between a curse and a prohibition is not a large one. The 'bans' may be execrations, but the mind may be encouraged to move through further associations, from the banns before marriage, the prohibitive and possessive ethic constraining 'lawless' love ('Thou Shalt Not' writ over the door'), to the bans of Church and State against the publications and activities of the followers of Tom Paine. All these associations are gathered into the central one of a code of morality which constricts, denies, prohibits and punishes. The third verse commenced in the notebook as:

But most the chimney sweepers cry
 Blackens o'er the churches walls

This second line was then changed to:

Every blackning church appalls

The effect is one of concentration. Pertinacious critics have been able to invert most of Blake's meanings, and readers have even been found to suppose that these two lines (in their final form) are a comment upon the awakening social conscience of the churches under the influence of the evangelical revival: the churches are appalled by the plight of the chimney-sweeping boys. The meaning, of course, is the opposite; and on this point the notebook entitles us to have confidence. In the first version the churches are clearly shown as passive, while the cry of the chimney-sweepers attaches itself, with the smoke of commerce, to their walls. By revising the line Blake has

simply tightened up the strings of his indignation by another notch. He has packed the meaning of 'The Chimney Sweeper' of the *Songs of Experience* (whose father and mother 'are both gone up to the church' to 'praise God & his Priest & King,/ Who make up a heaven of our misery') into a single line, the adjective 'blackning' visually attaching to the Church complicity in the brutal exploitation of young childhood along with the wider consequences of the smoke of expanding commerce. 'Appalls' is used in a transitive sense familiar in Blake's time - not as 'is appalled by' but as puts to shame, puts in fear, challenges, indicts, in the same way as the dying sigh of the soldier indicts (and also threatens, with an apocalyptic image)¹⁹ the Palace. 'An ancient Proverb' in the notebook gives the three elements of a curse upon England:

Remove away that blackning church Remove
away that marriage hearse Remove away that
[place: *del.*] man of blood You'll quite remove
the ancient curse.

Church, marriage and monarchy: but if he had left it at 'place', then it could have been Tyburn (or Newgate), the place of public execution - the altar of the 'Moral & Self-Righteous Law' of Babylon and Cruel Og, in the centre of London, whose public rituals Blake may have witnessed.

The poem, in its first version, was to end at this point, at 'Runs in blood down Palace walls'. But Blake was not yet satisfied: he returned, and worked through three versions of a fourth, concluding verse, squeezing it in between other drafts already on the page. One attempt reads:

But most thro wintry streets I hear
How the midnight harlots curse
Blasts the new born infants tear
And smites with plagues the marriage hearse.

Bateson tells us that 'the images are sometimes interpreted as a reference to venereal disease. But this is to read Blake too literally. The diseases that descend upon the infant and the newly married couple are apocalyptic horrors similar to the blood that runs down the palace walls.'

It may be nice to think so. But the blood of the soldier is for real, as well as apocalyptic, and so is the venereal disease that blinds the new-born infant and which plagues the marriage hearse. We need not go outside the poem to document the increased discussion of such disease in the early 1790s,³ nor, to turn the coin over, the indictment by Mary Wollstonecraft and her circle of marriage without love as prostitution. The poem makes the point very literally. Blake was often a very literal-minded man.

Another fragment in the notebook is closely related to this conclusion: a verse intended as the conclusion to 'The Human Abstract' (or so it would seem) but not used in its final version. It does not, in fact, relate directly to the imagery of 'The Human Abstract' and we may suppose that Blake, when he realised this, saw also how he could transpose the concept to make a conclusion to 'London':

There souls of men are bought & sold
And milk fed infancy for gold

And youth to slaughter houses led
 And [maidens: *del.*] beauty for a bit of bread.²⁴

This enables us to see, once more, that 'London' is a literal poem and it is also an apocalyptic one; or we may say that it is a poem whose moral realism is so searching that it is raised to the intensity of apocalyptic vision. For the poem is not, of course, a terrible cumulative *catalogue* of unrelated abuses and suffering. It is organised in two ways. First, and most simply, it is organised about the street-cries of London. In the first verse, we are placed with Blake (if we are entitled - as I think we are - to take him as the wandering observer) and we 'see' with his eyes. But in the second, third and fourth verses we are *hearing*, and the passage from sight to sound has an effect of reducing the sense of distance or of the alienation of the observer from his object of the first verse, and of immersing us within the human condition through which he walks. We *see* one thing at a time, as distinct moments of perception, although, by the end of the first verse, these perceptions become cumulative and repetitive ('in every face... marks ... marks'). We *hear* many things simultaneously. Literally, we hear the eerie, almost animal cadence of the street-cries (and although we may now be forgetting them, if we were to be transported somehow to eighteenth-century London, these cries would be our first and most astonishing impression), the cries of the children, the 'weep', 'weep' of the chimney-sweeps, and, led on by these, we hear the more symbolic sounds of 'bans', 'manacles' and the soldier's 'sigh'. This second verse is all sounds and it moves through an acceleration of generalisation towards the third. If 'charter'd' is repeated, and if 'marks' falls with a triple beat, 'every' falls upon us no less than seven times: a single incidence in the first verse prepares for five uses in the second and a single incidence in the third ties it into the developing structure. 'Cry' also falls three times, carrying us from the second verse to the first line of the third. But in the third verse there is a thickening of sensual perception. Until this point we have seen and heard, but now we 'sense', through the sounds (the 'cry' and the 'sigh'), the activities that these indicate: the efforts of the chimney-sweep, the blackening walls of the churches, the blood of the soldier. We are not detached from this predicament; if anything, this impression of 'hearing' giving way to 'sensing' immerses us even more deeply within it.

We have been wandering, with Blake, into an ever more dense immersion. But the opening of the fourth verse ('But most thro' midnight streets I hear') appears to set us a little apart from this once more. 'I hear' takes us back from ourselves to Blake who is a little apart from the scene and listening. Nothing in the earlier verses had prepared us for the darkness of 'midnight streets', unless perhaps the 'blackning Church': what had been suggested before was the activity of the day-time streets, the street-cries, the occasions of commerce. The verse is not knitted in tidily to the rest at the level of literal organisation: the 'Marriage hearse' is a conceit more abstract than any other in the poem, apart from 'mind-forg'd manacles'. Since we know that he had intended at first to end the poem with three verses,² should we say that the final verse was an afterthought tacked on after the original images had ceased to beat in his mind - imperfectly soldered to the main body and still betraying signs of a separate origin?

It is a fair question. Blake, like other poets, had afterthoughts and made revisions which were unwise. And if we were to stop short at this literal or technical organisation of the poem we could make a case against its final verse. But we must attend also to a second, symbolic, level of organisation. The immersion in sights and sounds

is of a kind which forces one to generalise from London to 'the human condition'. The point is self-evident ('In every cry of every Man'). But this kind of statement, of which a certain school of commentators on Blake is over-fond, takes us only a little way, and a great deal less far than is sometimes knowingly implied. For 'the human condition', unless further qualified or disclosed, is nothing but a kind of metaphysical full stop. Or, worse than that, it is a bundle of solecisms about mortality and defeated aspiration. But 'the human condition' is what poets make poetry *out of* not what they end up with. This poem is about a *particular* human condition, which acquires, through the selection of the simplest and most archetypal examples (man, infant, soldier, palace, harlot), a generalised resonance; it expresses an attitude *towards* that condition; and it offers a unitary analysis as to its character.

Two comments may be made on the attitude disclosed by Blake towards his own material. First, it is often noted that 'London' is one of the *Songs of Experience* which carries 'the voice of honest indignation'. This is true. The voice can be heard from the first 'charter'd'; it rises to full strength in the third and final verses (appalls, runs in blood, blasts, blights). But it is equally true that this voice is held in equilibrium with the voice of compassion. This is clear from the first introduction of 'mark'. If we have here (and the triple insistence enforces conviction) the 'mark of the Beast', Blake would have been entitled to pour down upon these worshippers at the shrine of false gods the full vials of his wrath:

And there followed another angel, saying, Babylon is fallen, is fallen, that great city, because she made all nations drink of the wine of the wrath of her fornication.

And the third angel followed them, saying with a loud voice, If any man worship the beast and his image, and receive his mark in his forehead, or in his hand,

The same shall drink of the wine of the wrath of God, which is poured out without mixture into the cup of his indignation; and he shall be tormented with fire and brimstone in the presence of the holy angels, and in the presence of the Lamb:

And the smoke of their torment ascendeth up for ever and ever: and they have no rest day nor night, who worship the Beast and his image, and whosoever receiveth the mark of his name.

But Blake indicates 'weakness' and 'woe', and the slow rhythm of the line, checked at mid-point, suggests contemplation and pity rather than wrath. Nor is this note of grave compassion ever lost: it continues in the cries, the fear, the tear: even the soldier is 'hapless'. If 'London' is that part of that human condition which may be equally described as 'Hell', it is not a hell to which only the damned are confined, while the saved may contemplate their torments; nor is this Vergil's 'Hades'. This is a city of Everyman; nor do we feel, in our increasing immersion, that we - or Blake himself - are observers from without. These are not so much our fellow-damned as our fellow-sufferers.

The second comment upon Blake's attitude is this: his treatment of the city departs from a strong literary convention. To establish this point fully would take us further outside the poem than I mean to go. But one way of handling the city, both in itself and as an exemplar of the human condition, derived from classical (especially Juvenalian) satire; and in this it is the city's turbulence, its theatre of changing human passions, its fractured, accidental and episodic life, its swift succession of discrete images of human vice, guile or helplessness, which provided the staple of the convention. Samuel Johnson's 'London' was the place where at one corner a 'fell

attorney prowls for prey' and at the next a 'female atheist talks you dead'. And the convention was, in some part, a countryman's convention, in some part a class convention - generally both: a country gentleman's convention. From whichever aspect, plebeian London was seen from outside as a spectacle. Wordsworth was still able to draw upon this convention - although with significant shifts of emphasis - in *The Prelude*.

Blake's 'London' is not seen from without as spectacle. It is seen, or suffered, from within, by a Londoner. And what is unusual about *this* image of the-human-condition-as-hell is that it offers the city as a unitary experience and not as a theatre of discrete episodes. For this to be so, there must be an ulterior symbolic organisation behind the literal organisation of this street-cry following upon that. And this symbolic organisation should now, after this lengthy discussion, have become fully disclosed. The tone of compassion falls upon those who are in hell, the sufferers; but the tone of indignation falls upon the institutions of repression - mind-forg'd manacles, blackning Church, Palace, Marriage hearse. And the symbolic organisation is within the clearly conceived and developing logic of market relations. Blake does not only list symptoms: within the developing imagery which unites the poem he also discloses their cause. From the first introduction of 'charter'd' he never loses hold of the image of buying and selling although these words themselves are never used. 'Charter'd' both grants from on high and licenses and it limits and excludes; if we recall Paine it is a 'selling and buying' of freedom. What are bought and sold in 'London' are not only goods and services but human values, affections and vitalities. From freedom we move (with 'mark') to a race marked by buying and selling, the worshippers of the Beast and his image. Then we move through these values in ascendant scale: goods are bought and sold (street-cries), childhood (the chimney-sweep), human life (the soldier) and, in the final verse, youth, beauty and love, the source of life, is bought and sold in the figure of the diseased harlot who, herself, is only the other side of the 'Marriage hearse'.²⁸ In a series of literal, unified images of great power Blake compresses an indictment of the acquisitive ethic, endorsed by the institutions of State, which divides man from man, brings him into mental and moral bondage, destroys the sources of joy and brings, as its consequence, blindness and death.

It is now evident why the final verse is no afterthought but appeared to Blake as the necessary conclusion to the poem. The fragment left over from 'The Human Abstract'

There souls of men are bought & sold
And milk fed infancy for gold And
youth to slaughter houses led And
beauty for a bit of bread

is a synopsis of the argument in 'London'. As it stands it remains as an argument, a series of assertions which would only persuade those already persuaded. But it provided, in its last line, the image of the harlot, whose love is bought and sold, which was necessary to complete 'London' and make that poem 'shut like a box'. And the harlot not only provides a culminating symbol of the reification of values, she is also a point of junction with the parallel imagery of religious mystification and oppression: for if this is Babylon, then the harlot is Babylon's whore who brought about the city's fall 'because she made all nations drink of the wine of the wrath of her

fornication'. For English radical Dissent in the eighteenth century, the whore of Babylon was not only the 'scarlet woman' of Rome, but also *all* Erastianism, all compromise between things spiritual and the temporal powers of the State, and hence, very specifically, that extraordinary Erastian formation, the Church of England. One recalls Blake's annotations to Bishop Watson (throughout), and his polemic against 'The Abomination that maketh desolate, i.e. State Religion which is the Source of all Cruelty' (E607). Hence the harlot is able to unite in a single nexus the imagery of market relations and the imagery of ideological domination by the agency of a State Church, prostituted to the occasions of temporal power.

To tie the poem up in this way was, perhaps, to add to its pessimism. To end with the blood on the Palace walls might suggest an apocalyptic consummation, a revolutionary overthrow. To end with the diseased infant is to implant life within a cycle of defeat. And yet the poem doesn't *sound* defeated, in part because the tone of compassion or of indignation offers a challenge to the logic of its 'argument', in part because the logic of the symbolic analysis of market relations proposes, at the same time, if not an alternative, at least the challenge that (in compassion and in indignation) this alternative could be found.

In any case, these pages of mine have been teasing out meanings from one poem of sixteen lines. And Blake's larger meanings lie in groupings of poems, in contraries and in cumulative insights into differing states. 'London' is not about the human condition but about a particular condition or state, and a way of seeing this. This state must be set against other states, both of experience and of innocence. Thus we must place 'London' alongside 'The Human Abstract', which shows the generation of the prohibitive Tree of Mystery, whose fruit continually regenerates man's Fall: and in this conjunction 'London' (when seen as hell) shows the condition of the Fallen who lie within the empire of property, self-interest, State religion and Mystery. And when the poem is replaced within the context of the *Songs* it is easier to see the fraternal but transformed relationship which Blake's thought at this time bears to Painite radicalism and to the deist and rationalist critique of orthodox religion. 'London' is informed throughout by the antinomian contempt for the Moral Law and the institutions of State, including monarchy and marriage, just as are 'The Garden of Love' and 'The Chimney Sweeper'. With great emphasis it is coming to conclusions very close to those of Paine and his circle. A conjunction between the old antinomian tradition and Jacobinism is taking place.

But while Blake is accepting a part of the Painite argument he is also turning it to a new account. For while 'London' is a poem which a Jacobinical Londoner might have responded to and accepted, it is scarcely one which he could have written. The average supporter of the London Corresponding Society would not have written 'mind-forg'd' (since the manacles would have been seen as wholly exterior, imposed by oppressive priestcraft and kingcraft); and the voice of indignation would probably have drowned the voice of compassion, since most Painites would have found it difficult to accept Blake's vision of humankind as being simultaneously oppressed (although by very much the same forces as those described by Paine) and in a self-victimised or Fallen state. One might seem to contradict the other. And behind this would lie ulterior differences both as to the 'cause' of this human condition and also as to its 'remedy'.

For Blake had always been decisively alienated from the mechanical materialist epistemology and psychology which he saw as derived from Newton and Locke. And he did not for a moment shed his suspicion of radicalism's indebtedness to this materi-

alism, with its prime explanatory principle of self-love. We shall return to this. So that if Blake found congenial the Painite denunciation of the repressive institutions of State and Church, it did not follow that humanity's redemption from this state could be effected by a political reorganisation of these institutions alone. There must be some Utopian leap, some human rebirth, from Mystery to renewed imaginative life. 'London' must still be made over anew as the New Jerusalem. And we can't take a full view of even this poem without recalling that Blake did not always see London in this way; it was not always to be seen as Babylon or as the city of destruction in the Apocalypse. There were other times when he saw it as the city of lost innocence:

The fields from Islington to Marybone, To
Primrose Hill and Saint Johns Wood: Were
builded over with pillars of gold, And there
Jeruselems pillars stood.

The Jews-harp-house & the Green Man;
The Ponds where Boys to bathe delight;
The Fields of Cows by Willans farm: Shine
in Jeruselems pleasant sight.

And it could also be the millennial city, of that time when the moral and self-righteous law should be overthrown, and the Multitude return to Unity:

In my Exchanges every Land Shall
walk, & mine in every Land, Mutual
shall build Jerusalem: Both heart in
heart & hand in hand.

(E170, 172)

Notes

- 1 John Beer, *Blake's Humanism* (Manchester, 1968), p. 75.
- 2 *The Notebook of William Blake*, ed. David V. Erdman (Oxford, 1973), p. 109; hereafter cited as N.
- 3 N113. The obliterated title of this fragment has been recovered by David Erdman as 'Thames'.
- 4 See David Erdman, *Blake: Prophet against Empire*, which fully argues these points on pp. 272-9. These poems were 'forged in the heat of the Year One of Equality (September 1792 to 1793) and tempered in the "grey-brow'd snows" of Antijacobin alarms and proclamations'. See also A. Mitchell, 'The Association Movement of 1792-3', *Historical Journal*, 4: 1 (1961), 56-77; E. P. Thompson, *The Making of the English Working Class* (Harmondsworth, 1968), pp. 115-26; D. E. Ginter, 'The Loyalist Association Movement. 1792-3', *Historical Journal*, 4: 2 (1966), 179-90.
- 5 'The cheating waves of charter'd streams' and 'the cheating banks of Thames' should prompt one to think carefully of this as the source which first gave to Blake this use of 'charter'd'. The fullest attack from a Painite source on the East India Company did not appear until 1794: see the editorial articles in four successive numbers of Daniel Isaac Eaton's *Politics for the People*, 2: 8-11: 'The East India Charter Considered'. These constituted a full-blooded attack on the Company's commercial and military imperialism ('if it be deemed expedient to *murder* half the inhabitants of India, and *rob* the remainder, surely it is not requisite to call it *governing* them?') which carried to their furthest point criticisms of the Company to be found in the reforming and Foxite press of 1792-3. No social historian can be surprised to find the banks of the

Thames described as 'cheating' in the eighteenth century: every kind of fraud and racket, big, small and indifferent, flourished around the docks. The association of the banks of Thames with commerce was already traditional when Samuel Johnson renewed it in his 'London' (1738), especially lines 20-30. Johnson's attitude is already ambiguous: 'Britannia's glories' ('The guard of commerce, and the dread of Spain') are invoked retrospectively in conventional terms: but on Thames-side already 'all are slaves to gold, / Where looks are merchandise, and smiles are sold'. Erdman argues that the 'golden London' and 'silver Thames' of Blake's 'King Edward the Third' have already assimilated this conventional contrast in the form of irony: see Erdman, pp. 80-1.

- 6 E415. If we take the intention of this fragment to be ironic, then Blake was already regarding the word as suspect rhetoric.
- 7 Raymond Williams, *The Country and the City* (1973), p. 148.
- 8 Kathleen Raine, vol. 1, pp. 24-5 (citing Dryden's *Aeneid* vi. 998-1001).
- 9 Heather Glen has noted that 'the sense of an inevitable and imprisoning relationship between the "facts" he sees and the way in which he sees is reinforced by the use of "mark" as both verb and object'. See 'The Poet in Society: Blake and Wordsworth on London', *Literature and History* 3 (March 1976).
- 10 Among others, by Harold Bloom and David Erdman, and, with a different emphasis, by Heather Glen.
- 11 This suggestion has been pressed by Stan Smith, 'Some Responses to Heather Glen's "The Poet in Society"', *Literature and History* 4 (Autumn 1976). The 'mark of Cain' in Genesis was sometimes assimilated in theological exegesis to the mark of the Beast. The Lord curses Cain and condemns him to be a fugitive and a vagabond. Cain complains that he will be killed as an outlaw, and the Lord replies: 'Whosoever slayeth Cain, vengeance shall be taken on him sevenfold. And the Lord set a mark upon Cain, lest any finding him should kill him.' Whether the Lord did this as an act of forgiveness or as a protraction of the punishment of ostracism and outlawry (as anthropologists would argue) is a matter of interpretation. Stan Smith certainly carries the Lord's intentions very much too far when he takes the mark as a sign of 'election'. But he is surely right to argue that the poem can carry *this* ambivalence (men are 'both agents and patients, culprits and victims'), since in Blake's Christian dialectic the mark of Cain could stand simultaneously as a sign of sin and as a sign of its forgiveness. See Blake's chapter title to the 'Genesis' fragment: 'Chapter iv How Generation & Death took possession of the Natural Man & of the Forgiveness of Sins written upon the Murderers Forehead' (E667).
- 12 See, e.g., Thompson, pp. 127-9, 420-6, and sources cited there; and Morton D. Paley, 'William Blake, the Prince of the Hebrews, and the Women Clothed with the Sun', in Morton D. Paley and Michael Phillips (eds.), *William Blake: Essays in Honour of Sir Geoffrey Keynes* (Oxford, 1973). Swedenborgians were much concerned with interpretation of Revelation; and the verses which I have cited ('no man might buy or sell, save he that had the mark... of the beast') were discussed in the *New Magazine of Knowledge Concerning Heaven and Hell*, 1 (July 1790), 209-11. When Blake's acquaintance Stedman heard the news, on 6 April 1792, that Gustavus III, the King of Sweden, had been assassinated, his mind turned in the same direction: 'despotism dies away. Witness France, whose King may be compared to the beast in Revelation, whose number is 666, and LUDOVICUS added together makes the same. One, Sutherland, lately shot himself before King George... Such are the times': *The Journal of John Gabriel Stedman 1744-1797*, ed. Stanbury Thompson (1962), pp. 340-1; I am indebted to Michael Phillips for this reference.
- 13 One further suggestion may be offered about the mark of the Beast. The Muggletonians afford yet one more possible resonance of 'mark'. In Swedenborgian exegesis the 'mark of the Beast' was sometimes taken to signify the solifidian doctrine of justification by faith without works. But Blake can scarcely have been using 'mark' in this way, since this was precisely his own, antinomian, 'heresy'. The Muggletonians, however, offer a very different interpretation. In their meetings prayer was rejected, as a 'mark of weakness', and Muggleton wrote:

The mark of the beast is this, when a head magistrate or chief council in a nation or kingdom, shall set up... a set form of worship, he or they having no commission from God so to do, and

shall cause the people by their power and authority... to worship after this manner of worship that is set up by authority, as this beast did...

Hence to receive the mark of the Beast signifies 'to worship the image set up' by established authority. L. Muggleton, *A True Interpretation of... the Whole Book of the Revelation of St John* (1808), pp. 174–5. This appears to take us very much closer to the universe of Blakean symbolism than do the Swedenborgian glosses.

- 14 See Erdman, pp. 277–8.
- 15 Blake was also thinking of priestcraft, as we know from 'The Human Abstract'. Nancy Bogen suggests (*Notes and Queries*, new series, 15: 1 (January 1968)) that he may have been reading Gilbert Imlay's *Topographical Description* (London, 1792): on the Ohio (where the Thames-born slave will go to be free) Imlay found freedom from priestcraft which elsewhere 'seems to have forged fetters for the human mind'. But the poem itself carries this suggestion only in so far as the manacles immediately precede the 'blackning Church'. Fetters and manacles were anyway part of a very general currency of imagery: see, e.g., Erdman, p. 129, n. 35.
- 16 F. W. Bateson, *Selected Poems of William Blake* (1957), p. 126.
- 17 See E. D. Hirsch, *Innocence and Experience* (New Haven, 1964), p. 264.
- 18 For an example of this confusion, see D. G. Gillham, *Blake's Contrary States* (Cambridge, 1966), p. 12: 'The Church is horrified at the evil of the sweeper's condition, but it is helpless to do much about it...'
- 19 On this point, see Erdman, pp. 278–9. The British reformers of the 1790s were, of course, at pains to stress the identity of interests of the soldiers and the people: and also to expose military injustices, flogging, forcible recruitment ('crimping'), etc.
- 20 Many examples could be given of this transitive use of 'appal': see also the *OED* and the last line of 'Holy Thursday' in *Experience*. Thus William Frend, who shared something of Blake's ultra-radical Christian values, wrote: 'Oh! that I had the warning voice of an ancient prophet, that I might penetrate into the innermost recesses of palaces, and appal the haranguers of senates!' Frend's 'appal' means 'throw into consternation', 'warn', 'shock'. The phrase was used in the appendix to William Frend, *Peace and Union Recommended* (St Ives, 1792): this pamphlet occasioned the celebrated case of Frend's trial before the Vice-Chancellor and his expulsion from Cambridge: see Frida Knight, *University Rebel* (1971), esp. chapter 8. The pamphlet was on sale by mid-February 1793 (William Frend, *Account of the Proceedings...* (Cambridge, 1793), p. 72), and the appendix caused especial outrage among loyalists, and by the first week in May the University had opened its proceedings against Frend. From the juxtaposition of ancient prophet, palaces and appal, and from the fact that Blake and Frend shared friends and sympathies (see Erdman, pp. 158–9), one could argue that Blake's line could carry an echo of this celebrated case. But this is highly unlikely: Erdman gives a terminal date for inscribing the *Experience* drafts in the notebook as October 1792 (N7) - although 'appalls' was introduced as a revision, perhaps subsequently. But it is unnecessary to argue for such direct influence. What we are really finding is a vocabulary and stock of images common to a particular group or a particular intellectual tradition, in this case that of radical Dissent. It is helpful to identify these groups and traditions, since they both place Blake and help us to unlock his meanings: but as to the actual 'source' we must maintain a steady scepticism.
- 21 NI07.
- 22 Bateson, *Selected Poems*, p. 126. See also the more elaborate (and unhelpful) argument of Harold Bloom, *Blake's Apocalypse: A Study in Poetic Argument* (Ithaca, NY, 1963), pp. 141–2, which also discounts the clear meaning of the third line.
- 23 As, for example, the long review of Jesse Foot, *A Complete Treatise on the Origin, Theory, and Cure of the Lues Venerea etc.* (1792 - but based on lectures read in Dean Street, Soho, in 1790 and 1791) in *Analytical Review*, 12 (April 1792), 399, and 13 (July 1792), 261. See also the discussion in Grant C. Roti and Donald L. Kent, 'The Last Stanza of Blake's London', *Blake: An Illustrated Quarterly*, 11: 1 (Summer 1977).
- 24 NI07.
- 25 This is emphasised by the fact that it was the first line of verse 3 which (in the notebook draft) was to begin with 'But most...'; 'But most the chimney sweepers cry'.

- 26 Revelation xiv. 8-11. These verses immediately precede those in which the Son of Man appears with 'in his hand a sharp sickle', and which lead on to 'the great winepress of the wrath of God' (xiv. 14—20) - that vision of the last vintage which worked in Blake's imagination.
- 27 See Williams, *Country and City*, chapter 14, and Glen, 'The Poet in Society'.
- 28 With 'Marriage hearse' we are at the point of junction with another universe of imagery which critics of the 'neo-Platonist' persuasion emphasise to the exclusion of all other aspects of Blake's thought. In this universe, for the spirit to assume mortal dress is a form of death or sleep: hence sexual generation generates death: hence (these would argue) 'Marriage hearse'. There are times when Blake uses images in this way, although often with more equivocation, inversion or idiosyncrasy than this kind of criticism suggests. This is not, however, one of these times. The poem is not concerned with lamenting the constrictions of the spirit within its material 'coffin' but with the 'plagues' which 'blight' sexual love and generation.
- 29 See F. R. Leavis, 'Justifying One's Valuation of Blake', in Paley and Phillips, *Essays*, p. 80: 'the effect of the poetry [of the *Songs*] is very far from inducing an acceptance of human defeat. One can testify that the poet himself is not frightened, and, further, that there is no malevolence, no anti-human animus, no reductive bent, in his realism ...'

Discipline and Punish

Michel Foucault

Michel Foucault's major work on the history of power, published in 1975, portrays power as something dispersed throughout society. In his famous example of the Panopticon, a circular prison that allows for permanent surveillance of prisoners, Foucault suggests that the citizens of Western democracies act as their own jail-keepers. They internalize the social control that monitors society and maintains the disciplined efficiency of the social system. In this work as well, Foucault began to draw attention to the role of the body in social discipline.

Historians long ago began to write the history of the body. They have studied the body in the field of historical demography or pathology; they have considered it as the seat of needs and appetites, as the locus of physiological processes and metabolisms, as a target for the attacks of germs or viruses; they have shown to what extent historical processes were involved in what might seem to be the purely biological base of existence; and what place should be given in the history of society to biological "events" such as the circulation of bacilli, or the extension of the lifespan. But the body is also directly involved in a political field; power relations have an immediate hold upon it; they invest it, mark it, train it, torture it, force it to carry out tasks, to perform ceremonies, to emit signs. This political investment of the body is bound up, in accordance with complex reciprocal relations, with its economic use: it is largely as a force of production that the body is invested with relations of power and domination; but, on the other hand, its constitution as labor power is possible only if it is caught up in a system of subjection (in which need is also a political instrument meticulously prepared, calculated, and used); the body becomes a useful force only if it is both a productive body and a subjected body. This subjection is not only obtained by the instruments of violence or ideology; it can also be direct, physical, pitting force against force, bearing on material elements, and yet without involving violence; it may be calculated, organized, technically thought out; it may be subtle, make use neither of weapons nor of terror and yet remain of a physical order. That is to say, there may be a "knowledge" of the body that is not exactly the science of its functioning, and a mastery of its forces that is more than the ability to conquer them: this knowledge and this mastery constitute what might be called the political technology of the body. Of course, this technology is diffuse, rarely formulated in continuous, systematic discourse; it is often made up of bits and pieces; it implements a disparate set of tools or methods. In spite of the coherence of its results, it is generally no more than a multiform instrumentation. Moreover, it cannot be localized in a particular type of institution or state apparatus.

For they have recourse to it; they use, select, or impose certain of its methods. But, in its mechanisms and its effects, it is situated at a quite different level. What the apparatuses and institutions operate is, in a sense, a micro-physics of power, whose field of validity is situated in a sense between these great functionings and the bodies themselves with their materiality and their forces.

Now, the study of this micro-physics presupposes that the power exercised on the body is conceived not as a property, but as a strategy, that its effects of domination are attributed not to "appropriation," but to dispositions, maneuvers, tactics, techniques, functionings; that one should decipher in it a network of relations, constantly in tension, in activity, rather than a privilege that one might possess; that one should take as its model a perpetual battle rather than a contract regulating a transaction or the conquest of a territory. In short this power is exercised rather than possessed; it is not the "privilege," acquired or preserved, of the dominant class, but the overall effect of its strategic positions - an effect that is manifested and sometimes extended by the position of those who are dominated. Furthermore, this power is not exercised simply as an obligation or a prohibition on those who "do not have it"; it invests them, is transmitted by them and through them; it exerts pressure upon them, just as they themselves, in their struggle against it, resist the grip it has on them. This means that these relations go right down into the depths of society, that they are not localized in the relations between the state and its citizens or on the frontier between classes and that they do not merely reproduce, at the level of individuals, bodies, gestures, and behavior, the general form of the law or government; that, although there is continuity (they are indeed articulated on this form through a whole series of complex mechanisms), there is neither analogy nor homology, but a specificity of mechanism and modality. Lastly, they are not univocal; they define innumerable points of confrontation, focuses of instability, each of which has its own risks of conflict, of struggles, and of an at least temporary inversion of the power relations. The overthrow of these "micro-powers" does not, then, obey the law of all or nothing; it is not acquired once and for all by a new control of the apparatuses nor by a new functioning or a destruction of the institutions; on the other hand, none of its localized episodes may be inscribed in history except by the effects that it induces on the entire network in which it is caught up.

Perhaps, too, we should abandon a whole tradition that allows us to imagine that knowledge can exist only where the power relations are suspended and that knowledge can develop only outside its injunctions, its demands, and its interests. Perhaps we should abandon the belief that power makes mad and that, by the same token, the renunciation of power is one of the conditions of knowledge. We should admit rather that power produces knowledge (and not simply by encouraging it because it serves power or by applying it because it is useful); that power and knowledge directly imply one another; that there is no power relation without the correlative constitution of a field of knowledge, nor any knowledge that does not presuppose and constitute at the same time power relations. These "power-knowledge relations" are to be analyzed, therefore, not on the basis of a subject of knowledge who is or is not free in relation to the power system, but, on the contrary, the subject who knows, the objects to be known and the modalities of knowledge must be regarded as so many effects of these fundamental implications of power-knowledge and their historical transformations. In short, it is not the activity of the subject of knowledge that

produces a corpus of knowledge, useful or resistant to power, but power-knowledge, the processes and struggles that traverse it and of which it is made up, that determines the forms and possible domains of knowledge ____

Panopticism

The following, according to an order published at the end of the seventeenth century, were the measures to be taken when the plague appeared in a town.

First, a strict spatial partitioning: the closing of the town and its outlying districts, a prohibition to leave the town on pain of death, the killing of all stray animals; the division of the town into distinct quarters, each governed by an intendant. Each street is placed under the authority of a syndic, who keeps it under surveillance; if he leaves the street, he will be condemned to death. On the appointed day, everyone is ordered to stay indoors: it is forbidden to leave on pain of death. The syndic himself comes to lock the door of each house from the outside; he takes the key with him and hands it over to the intendant of the quarter; the intendant keeps it until the end of the quarantine. Each family will have made its own provisions; but, for bread and wine, small wooden canals are set up between the street and the interior of the houses, thus allowing each person to receive his ration without communicating with the suppliers and other residents; meat, fish, and herbs will be hoisted up into the houses with pulleys and baskets. If it is absolutely necessary to leave the house, it will be done in turn, avoiding any meeting. Only the intendants, syndics, and guards will move about the streets and also, between the infected houses, from one corpse to another, the "crows," who can be left to die: these are "people of little substance who carry the sick, bury the dead, clean and do many vile and abject offices." It is a segmented, immobile, frozen space. Each individual is fixed in his place. And, if he moves, he does so at the risk of his life, contagion, or punishment.

Inspection functions ceaselessly. The gaze is alert everywhere: "A considerable body of militia, commanded by good officers and men of substance," guards at the gates, at the town hall and in every quarter to ensure the prompt obedience of the people and the most absolute authority of the magistrates "as also to observe all disorder, theft, and extortion." At each of the town gates there will be an observation post; at the end of each street sentinels. Every day, the intendant visits the quarter in his charge, inquires whether the syndics have carried out their tasks, whether the inhabitants have anything to complain of; they "observe their actions." Every day, too, the syndic goes into the street for which he is responsible; stops before each house: gets all the inhabitants to appear at the windows (those who live overlooking the courtyard will be allocated a window looking onto the street at which no one but they may show themselves); he calls each of them by name; informs himself as to the state of each and every one of them - "in which respect the inhabitants will be compelled to speak the truth under pain of death"; if someone does not appear at the window, the syndic must ask why: "In this way he will find out easily enough whether dead or sick are being concealed." Everyone locked up in his cage, everyone at his window, answering to his name and showing himself when asked - it is the great review of the living and the dead.

This surveillance is based on a system of permanent registration: reports from the syndics to the intendants, from the intendants to the magistrates or mayor. At the

beginning of the "lock up," the role of each of the inhabitants present in the town is laid down, one by one; this document bears "the name, age, sex of everyone, notwithstanding his condition": a copy is sent to the intendant of the quarter, another to the office of the town hall, another to enable the syndic to make his daily roll call. Everything that may be observed during the course of the visits - deaths, illnesses, complaints, irregularities - is noted down and transmitted to the intendants and magistrates. The magistrates have complete control over medical treatment; they have appointed a physician in charge; no other practitioner may treat, no apothecary prepare medicine, no confessor visit a sick person without having received from him a written note "to prevent anyone from concealing and dealing with those sick of the contagion, unknown to the magistrates." The registration of the pathological must be constantly centralized. The relation of each individual to his disease and to his death passes through the representatives of power, the registration they make of it, the decisions they take on it.

Five or six days after the beginning of the quarantine, the process of purifying the houses one by one is begun. All the inhabitants are made to leave; in each room "the furniture and goods" are raised from the ground or suspended from the air; perfume is poured around the room; after carefully sealing the windows, doors, and even the keyholes with wax, the perfume is set alight. Finally, the entire house is closed while the perfume is consumed; those who have carried out the work are searched, as they were on entry, "in the presence of the residents of the house, to see that they did not have something on their persons as they left that they did not have on entering." Four hours later, the residents are allowed to re-enter their homes.

This enclosed, segmented space, observed at every point, in which the individuals are inserted in a fixed place, in which the slightest movements are supervised, in which all events are recorded, in which an uninterrupted work of writing links the center and periphery, in which power is exercised without division, according to a continuous hierarchical figure, in which each individual is constantly located, examined, and distributed among the living beings, the sick, and the dead - all this constitutes a compact model of the disciplinary mechanism. The plague is met by order; its function is to sort out every possible confusion: that of the disease, which is transmitted when bodies are mixed together; that of the evil, which is increased when fear and death overcome prohibitions. It lays down for each individual his place, his body, his disease, and his death, his well-being, by means of an omnipresent and omniscient power that subdivides itself in a regular, uninterrupted way even to the ultimate determination of the individual, of what characterizes him, of what belongs to him, of what happens to him. Against the plague, which is a mixture, discipline brings into play its power, which is one of analysis. A whole literary fiction grew up around the plague: suspended laws, lifted prohibitions, the frenzy of passing time, bodies mingling together without respect, individuals unmasked, abandoning their statutory identity and the figure under which they had been recognized, allowing a quite different truth to appear. But there was also a political dream of the plague, which was exactly its reverse: not the collective festival, but strict divisions; not laws transgressed, but the penetration of regulation into even the smallest details of everyday life through the mediation of the complete hierarchy that assured the capillary functioning of power; not masks that were put on and taken off, but the assignment to each individual of his "true" name, his "true" place, his "true" body, his "true" disease. The plague as a form, at once real and imaginary, of disorder had as its

medical and political correlative discipline. Behind the disciplinary mechanisms can be read the haunting memory of "contagions," of the plague, of rebellions, crimes, vagabondage, desertions, people who appear and disappear, live and die in disorder.

If it is true that the leper gave rise to rituals of exclusion, which to a certain extent provided the model for and general form of the great Confinement, then the plague gave rise to disciplinary projects. Rather than the massive, binary division between one set of people and another, it called for multiple separations, individualizing distributions, an organization in depth of surveillance and control, an intensification and a ramification of power. The leper was caught up in a practice of rejection, of exile-enclosure; he was left to his doom in a mass among which it was useless to differentiate; those sick of the plague were caught up in a meticulous tactical partitioning in which individual differentiations were the constricting effects of a power that multiplied, articulated, and subdivided itself; the great confinement on the one hand; the correct training on the other. The leper and his separation: the plague and its segmentations. The first is marked; the second analyzed and distributed. The exile of the leper and the arrest of the plague do not bring with them the same political dream. The first is that of a pure community, the second that of a disciplined society. Two ways of exercising power over men, of controlling their relations, of separating out their dangerous mixtures. The plague-stricken town, traversed throughout with hierarchy, surveillance, observation, writing; the town immobilized by the functioning of an extensive power that bears in a distinct way over all individual bodies - this is the Utopia of the perfectly governed city. The plague (envisaged as a possibility at least) is the trial in the course of which one may define ideally the exercise of disciplinary power. In order to make rights and laws function according to pure theory, the jurists place themselves in imagination in the state of nature; in order to see perfect disciplines functioning, rulers dreamt of the state of plague. Underlying disciplinary projects the image of the plague stands for all forms of confusion and disorder; just as the image of the leper, cut off from all human contact, underlies projects of exclusion.

They are different projects, then, but not incompatible ones. We see them coming slowly together, and it is the peculiarity of the nineteenth century that it applied to the space of exclusion of which the leper was the symbolic inhabitant (beggars, vagabonds, madmen and the disorderly formed the real population) the technique of power proper to disciplinary partitioning. Treat "lepers" as "plague victims," project the subtle segmentations of discipline onto the confused space of internment, combine it with the methods of analytical distribution proper to power, individualize the excluded, but use procedures of individualization to mark exclusion - this is what was operated regularly by disciplinary power from the beginning of the nineteenth century in the psychiatric asylum, the penitentiary, the reformatory, the approved school and, to some extent, the hospital. Generally speaking, all the authorities exercising individual control function according to a double mode; that of binary division and branding (mad/sane; dangerous/harmless; normal/abnormal); and that of coercive assignment, of differential distribution (who he is; where he must be; how he is to be characterized; how he is to be recognized; how a constant surveillance is to be exercised over him in an individual way, etc.). On the one hand, the lepers are treated as plague victims; the tactics of individualizing disciplines are imposed on the excluded; and, on the other hand, the universality of disciplinary controls makes it possible to brand the "leper" and to bring into play against him the dualistic

mechanisms of exclusion. The constant division between the normal and the abnormal, to which every individual is subjected, brings us back to our own time, by applying the binary branding and exile of the leper to quite different objects; the existence of a whole set of techniques and institutions for measuring, supervising and correcting the abnormal brings into play the disciplinary mechanisms to which the fear of the plague gave rise. All the mechanisms of power which, even today, are disposed around the abnormal individual, to brand him and to alter him, are composed of those two forms from which they distantly derive.

Bentham's *Panopticon* is the architectural figure of this composition. We know the principle on which it was based: at the periphery, an annular building; at the center, a tower; this tower is pierced with wide windows that open onto the inner side of the ring; the peripheric building is divided into cells, each of which extends the whole width of the building; they have two windows, one on the inside, corresponding to the windows of the tower; the other, on the outside, allows the light to cross the cell from one end to the other. All that is needed, then, is to place a supervisor in a central tower and to shut up in each cell a madman, a patient, a condemned man, a worker, or a schoolboy. By the effect of backlighting, one can observe from the tower, standing out precisely against the light, the small captive shadows in the cells of the periphery. They are like so many cages, so many small theaters, in which each actor is alone, perfectly individualized and constantly visible. The panoptic mechanism arranges spatial unities that make it possible to see constantly and to recognize immediately. In short, it reverses the principle of the dungeon; or rather of its three functions - to enclose, to deprive of light, and to hide - it preserves only the first and eliminates the other two. Full lighting and the eye of a supervisor capture better than darkness, which ultimately protected. Visibility is a trap.

To begin with, this made it possible - as a negative effect - to avoid those compact, swarming, howling masses that were to be found in places of confinement, those painted by Goya or described by Howard. Each individual, in his place, is securely confined to a cell from which he is seen from the front by the supervisor; but the side walls prevent him from coming into contact with his companions. He is seen, but he does not see; he is the object of information, never a subject in communication. The arrangement of his room, opposite the central tower, imposes on him an axial visibility; but the divisions of the ring, those separated cells, imply a lateral invisibility, and this invisibility is a guarantee of order. If the inmates are convicts, there is no danger of a plot, an attempt at collective escape, the planning of new crimes for the future, bad reciprocal influences; if they are patients, there is no danger of contagion; if they are madmen there is no risk of their committing violence upon one another; if they are schoolchildren, there is no copying, no noise, no chatter, no waste of time; if they are workers, there are no disorders, no theft, no coalitions, none of those distractions that slow down the rate of work, make it less perfect or cause accidents. The crowd, a compact mass, a locus of multiple exchanges, individualities merging together, a collective effect, is abolished and replaced by a collection of separated individualities. From the point of view of the guardian, it is replaced by a multiplicity that can be numbered and supervised; from the point of view of the inmates, by a sequestered and observed solitude.

Hence the major effect of the Panopticon: to induce in the inmate a state of conscious and permanent visibility that assures the automatic functioning of power. So to arrange things that the surveillance is permanent in its effects, even if it is

discontinuous in its action; that the perfection of power should tend to render its actual exercise unnecessary: that this architectural apparatus should be a machine for creating and sustaining a power relation independent of the person who exercises it; in short, that the inmates should be caught up in a power situation of which they are themselves the bearers. To achieve this, it is at once too much and too little that the prisoner should be constantly observed by an inspector: too little, for what matters is that he knows himself to be observed; too much, because he has no need in fact of being so. In view of this, Bentham laid down the principle that power should be visible and unverifiable. Visible: the inmate will constantly have before his eyes the tall outline of the central tower from which he is spied upon. Unverifiable: the inmate must never know whether he is being looked at at any one moment; but he must be sure that he may always be so. In order to make the presence or absence of the inspector unverifiable, so that the prisoners, in their cells, cannot even see a shadow, Bentham envisaged not only Venetian blinds on the windows of the central observation hall, but, on the inside, partitions that intersected the hall at right angles and, in order to pass from one quarter to the other, not doors but zig-zag openings; for the slightest noise, a gleam of light, a brightness in a half-opened door would betray the presence of the guardian. The Panopticon is a machine for dissociating the see/ being seen dyad: in the peripheric ring, one is totally seen, without ever seeing; in the central tower, one sees everything without ever being seen.

It is an important mechanism, for it automatizes and disindividualizes power. Power has its principle not so much in a person as in a certain concerted distribution of bodies, surfaces, lights, gazes; in an arrangement whose internal mechanisms produce the relation in which individuals are caught up. The ceremonies, the rituals, the marks by which the sovereign's surplus power was manifested are useless. There is a machinery that assures dissymmetry, disequilibrium, difference. Consequently, it does not matter who exercises power. Any individual, taken almost at random, can operate the machine: in the absence of the director, his family, his friends, his visitors, even his servants. Similarly, it does not matter what motive animates him: the curiosity of the indiscreet, the malice of a child, the thirst for knowledge of a philosopher who wishes to visit this museum of human nature, or the perversity of those who take pleasure in spying and punishing. The more numerous those anonymous and temporary observers are, the greater the risk for the inmate of being surprised and the greater his anxious awareness of being observed. The Panopticon is a marvelous machine which, whatever use one may wish to put it to, produces homogeneous effects of power.

A real subjection is born mechanically from a fictitious relation. So it is not necessary to use force to constrain the convict to good behavior, the madman to calm, the worker to work, the schoolboy to application, the patient to the observation of the regulations. Bentham was surprised that panoptic institutions could be so light: there were no more bars, no more chains, no more heavy locks; all that was needed was that the separations should be clear and the openings well arranged. The heaviness of the old "houses of security," with their fortress-like architecture, could be replaced by the simple, economic geometry of a "house of certainty." The efficiency of power, its constraining force have, in a sense, passed over to the other side - to the side of its surface of application. He who is subjected to a field of visibility, and who knows it, assumes responsibility for the constraints of power; he makes them play spontaneously upon himself; he inscribes in himself the power relation in

which he simultaneously plays both roles; he becomes the principle of his own subjection.

[T]he Panopticon... makes it possible to draw up differences: among patients, to observe the symptoms of each individual, without the proximity of beds, the circulation of miasmas, the effects of contagion confusing the clinical tables; among school children, it makes it possible to observe performances (without there being any imitation or copying), to map aptitudes, to assess characters, to draw up rigorous classifications and, in relation to normal development, to distinguish "laziness and stubbornness" from "incurable imbecility"; among workers, it makes it possible to note the aptitudes of each worker, compare the time he takes to perform a task, and if they are paid by the day, to calculate their wages ____

In short, it arranges things in such a way that the exercise of power is not added on from the outside, like a rigid, heavy constraint, to the functions it invests, but is so subtly present in them as to increase their efficiency by itself increasing its own points of contact ____

The panoptic schema, without disappearing as such or losing any of its properties, was destined to spread throughout the social body; its vocation was to become a generalized function. The plague-stricken town provided an exceptional disciplinary model: perfect, but absolutely violent; to the disease that brought death, power opposed its perpetual threat of death; life inside it was reduced to its simplest expression; it was, against the power of death, the meticulous exercise of the right of the sword. The Panopticon, on the other hand, has a role of amplification; although it arranges power, although it is intended to make it more economic and more effective, it does so not for power itself, nor for the immediate salvation of a threatened society: its aim is to strengthen the social forces - to increase production, to develop the economy, spread education, raise the level of public morality; to increase and multiply.

How is power to be strengthened in such a way that, far from impeding progress, far from weighing upon it with its rules and regulations, it actually facilitates such progress? What intensifier of power will be able at the same time to be a multiplier of production? How will power, by increasing its forces, be able to increase those of society instead of confiscating them or impeding them? The Panopticon's solution to this problem is that the productive increase of power can be assured only if, on the one hand, it can be exercised continuously in the very foundations of society, in the subtlest possible way, and if, on the other hand, it functions outside these sudden, violent, discontinuous forms that are bound up with the exercise of sovereignty. The body of the king, with its strange material and physical presence, with the force that he himself deploys or transmits to some few others, is at the opposite extreme of this new physics of power represented by panopticism; the domain of panopticism is, on the contrary, that whole lower region, that region of irregular bodies, with their details, their multiple movements, their heterogeneous forces, their spatial relations; what are required are mechanisms that analyze distributions, gaps, series, combinations, and which use instruments that render visible, record, differentiate, and compare: a physics of a relational and multiple power, which has its maximum intensity not in the person of the king, but in the bodies that can be individualized by these relations. At the theoretical level, Bentham defines another way of analyzing the social body and the power relations that traverse it; in terms of practice, he defines a procedure of subordination of bodies and forces that

must increase the utility of power while practicing the economy of the prince. Panopticism is the general principle of a new "political anatomy" whose object and end are not the relations of sovereignty but the relations of discipline.

The celebrated, transparent, circular cage, with its high tower powerful and knowing, may have been for Bentham a project of a perfect disciplinary institution; but he also set out to show how one may "unlock" the disciplines and get them to function in a diffused, multiple, polyvalent way throughout the whole social body. These disciplines, which the classical age had elaborated in specific, relatively enclosed places - barracks, schools, workshops - and whose total implementation had been imagined only at the limited and temporary scale of a plague-stricken town, Bentham dreamt of transforming into a network of mechanisms that would be everywhere and always alert, running through society without interruption in space or in time. The panoptic arrangement provides the formula for this generalization. It programs, at the level of an elementary and easily transferable mechanism, the basic functioning of a society penetrated through and through with disciplinary mechanisms.

There are two images, then, of discipline. At one extreme, the discipline-blockade, the enclosed institution, established on the edges of society, turned inwards towards negative functions: arresting evil, breaking communications, suspending time. At the other extreme, with panopticism, is the discipline-mechanism: a functional mechanism that must improve the exercise of power by making it lighter, more rapid, more effective, a design of subtle coercion for a society to come. The movement from one project to the other, from a schema of exceptional discipline to one of a generalized surveillance, rests on a historical transformation: the gradual extension of the mechanisms of discipline throughout the seventeenth and eighteenth centuries, their spread throughout the whole social body, the formation of what might be called in general the disciplinary society.

A whole disciplinary generalization - the Benthamite physics of power represents an acknowledgement of this - had operated throughout the classical age [roughly the eighteenth century]. The spread of disciplinary institutions, whose network was beginning to cover an ever larger surface and occupying above all a less and less marginal position, testifies to this: what was an islet, a privileged place, a circumstantial measure, or a singular model, became a general formula; the regulations characteristic of the Protestant and pious armies of William of Orange or of Gustavus Adolphus were transformed into regulations for all the armies of Europe; the model colleges of the Jesuits, or the schools of Batencour or Demias following the example set by Sturm, provided the outlines for the general forms of educational discipline; the ordering of the naval and military hospitals provided the model for the entire reorganization of hospitals in the eighteenth century.

But this extension of the disciplinary institutions was no doubt only the most visible aspect of various, more profound processes.

1 *The functional inversion of the disciplines.* At first, they were expected to neutralize dangers, to fix useless or disturbed populations, to avoid the inconveniences of over-large assemblies; now they were being asked to play a positive role, for they were becoming able to do so, to increase the possible utility of individuals. Military discipline is no longer a mere means of preventing looting, desertion, or failure to obey orders among the troops; it has become a basic technique to enable the army to exist, not as an assembled crowd, but as a unity that derives from this very unity an increase in its forces; discipline increases the skill of each individual, coordinates

these skills, accelerates movements, increases fire power, broadens the fronts of attack without reducing their vigor, increases the capacity for resistance, etc. The discipline of the workshop, while remaining a way of enforcing respect for the regulations and authorities, of preventing thefts or losses, tends to increase aptitudes, speeds, output, and therefore profits; it still exerts a moral influence over behavior, but more and more it treats actions in terms of their results, introduces bodies into a machinery, forces into an economy. When, in the seventeenth century, the provincial schools or the Christian elementary schools were founded, the justifications given for them were above all negative: those poor who were unable to bring up their children left them "in ignorance of their obligations: given the difficulties they have in earning a living, and themselves having been badly brought up, they are unable to communicate a sound upbringing that they themselves never had"; this involves three major inconveniences: ignorance of God; idleness (with its consequent drunkenness, impurity, larceny, brigandage); and the formation of those gangs of beggars, always ready to stir up public disorder and "virtually to exhaust the funds of the Hotel-Dieu." Now, at the beginning of the Revolution, the end laid down for primary education was to be, among other things, to "fortify," to "develop the body," to prepare the child "for a future in some mechanical work," to give him "an observant eye, a sure hand and prompt habits." The disciplines function increasingly as techniques for making useful individuals. Hence their emergence from a marginal position on the confines of society, and detachment from the forms of exclusion or expiation, confinement or retreat. Hence the slow loosening of their kinship with religious regularities and enclosures. Hence also their rooting in the most important, most central, and most productive sectors of society. They become attached to some of the great essential functions: factory production, the transmission of knowledge, the diffusion of aptitudes and skills, the war-machine. Hence, too, the double tendency one sees developing throughout the eighteenth century to increase the number of disciplinary institutions and to discipline the existing apparatuses.

2 *The swarming of disciplinary mechanisms.* While, on the one hand, the disciplinary establishments increase, their mechanisms have a certain tendency to become "de-institutionalized," to emerge from the closed fortresses in which they once functioned and to circulate in a "free" state; the massive, compact disciplines are broken down into flexible methods of control, which may be transferred and adapted. Sometimes the closed apparatuses add to their internal and specific function a role of external surveillance, developing around themselves a whole margin of lateral controls. Thus the Christian School must not simply train docile children; it must also make it possible to supervise the parents, to gain information as to their way of life, their resources, their piety, their morals. The school tends to constitute minute social observatories that penetrate even to the adults and exercise regular supervision over them: the bad behavior of the child, or his absence, is a legitimate pretext, according to Demia, for one to go and question the neighbors, especially if there is any reason to believe that the family will not tell the truth, one can then go and question the parents themselves, to find out whether they know their catechism and the prayers, whether they are determined to root out the vices of their children, how many beds there are in the house and what the sleeping arrangements are; the visit may end with the giving of alms, the present of a religious picture, or the provision of additional beds.

Similarly, the hospital is increasingly conceived of as a base for the medical observation of the population outside; after the burning down of the Hotel-Dieu in 1772,

there were several demands that the large buildings, so heavy and so disordered, should be replaced by a series of smaller hospitals; their function would be to take in the sick of the quarter, but also to gather information, to be alert to any endemic or epidemic phenomena, to open dispensaries, to give advice to the inhabitants and to keep the authorities informed of the sanitary state of the region.

One also sees the spread of disciplinary procedures, not in the form of enclosed institutions, but as centers of observation disseminated throughout society. Religious groups and charity organizations had long played this role of "disciplining" the population. From the Counter-Reformation to the philanthropy of the July monarchy, initiatives of this type continued to increase; their aims were religious (conversion and moralization), economic (aid and encouragement to work), or political (the struggle against discontent or agitation). One has only to cite by way of example the regulations for the charity associations in the Paris parishes. The territory to be covered was divided into quarters and cantons and the members of the associations divided themselves up along the same lines. These members had to visit their respective areas regularly; "they will strive to eradicate places of ill-repute, tobacco shops, life-classes, gaming houses, public scandals, blasphemy, impiety, and any other disorders that may come to their knowledge." They will also have to make individual visits to the poor; and the information to be obtained is laid down in regulations: the stability of the lodging, knowledge of prayers, attendance at the sacraments, knowledge of a trade, morality (and "whether they have not fallen into poverty through their own fault"); lastly, "one must learn by skillful questioning in what way they behave at home. Whether there is peace between them and their neighbors, whether they are careful to bring up their children in the fear of God... whether they do not have their older children of different sexes sleeping together and with them, whether they do not allow licentiousness and cajolery in their families, especially in their older daughters. If one has any doubts as to whether they are married, one must ask to see their marriage certificate."

3 *The state-control of the mechanisms of discipline.* In England, it was private religious groups that carried out, for a long time, the functions of social discipline; in France, although a part of this role remained in the hands of parish guilds or charity associations, another - and no doubt the most important part - was very soon taken over by the police apparatus.

The organization of a centralized police had long been regarded, even by contemporaries, as the most direct expression of royal absolutism; the sovereign had wished to have "his own magistrate to whom he might directly entrust his orders, his commissions, intentions, and who was entrusted with the execution of orders and orders under the King's private seal."¹² In effect, in taking over a number of pre existing functions - the search for criminals, urban surveillance, economic and political supervision - the police magistratures and the magistrature-general that presided over them in Paris transposed them into a single, strict, administrative machine: "All the radiations of force and information that spread from the circumference culminate in the magistrate-general ____ It is he who operates all the wheels that together produce order and harmony. The effects of his administration cannot be better compared than to the movement of the celestial bodies."

But, although the police as an institution were certainly organized in the form of a state apparatus, and although this was certainly linked directly to the center of political sovereignty, the type of power that it exercises, the mechanisms it operates and the

elements to which it applies them are specific. It is an apparatus that must be coextensive with the entire social body and not only by the extreme limits that it embraces, but by the minuteness of the details it is concerned with. Police power must bear "over everything": it is not, however, the totality of the state nor of the kingdom as visible and invisible body of the monarch; it is the dust of events, actions, behavior, opinions - "everything that happens";¹⁴ the police are concerned with "those things of every moment," those "unimportant things," of which Catherine II spoke in her *Great Instruction* (*Supplement to the Instruction for the drawing up of a new code*, 1769, article 535). With the police, one is in the indefinite world of a supervision that seeks ideally to reach the most elementary particle, the most passing phenomenon of the social body: "the ministry of the magistrates and police officers is of the greatest importance; the objects that it embraces are in a sense definite, one may perceive them only by a sufficiently detailed examination": the infinitely small of political power.

And, in order to be exercised, this power had to be given the instrument of permanent, exhaustive, omnipresent surveillance, capable of making all visible, as long as it could itself remain invisible. It had to be like a faceless gaze that transformed the whole social body into a field of perception: thousands of eyes posted everywhere, mobile attentions ever on the alert, a long, hierarchized network which, according to Le Maire, comprised for Paris the forty-eight *commissaires*, the twenty *inspecteurs*, then the "observers," who were paid regularly, the "*basses mouches*" or secret agents, who were paid by the day, then the informers, paid according to the job done, and finally the prostitutes. And this unceasing observation had to be accumulated in a series of reports and registers; throughout the eighteenth century, an immense police text increasingly covered society by means of a complex documentary organization. And, unlike the methods of judicial or administrative writing, what was registered in this way were forms of behavior, attitudes, possibilities, suspicions - a permanent account of individuals' behavior.

Now, it should be noted that, although this police supervision was entirely "in the hands of the king," it did not function in a single direction. It was in fact a double-entry system: it had to correspond by manipulating the machinery of justice, to the immediate wishes of the king, but it was also capable of responding to solicitations from below; the celebrated *lettres de cachet*, or orders under the king's private seal, which were long the symbol of arbitrary royal rule and which brought detention into disrepute on political grounds, were in fact demanded by families, masters, local notables, neighbors, parish priests; and their function was to punish by confinement a whole infra-penalty, that of disorder, agitation, disobedience, bad conduct; those things that Ledoux wanted to exclude from his architecturally perfect city and which he called "offences of non-surveillance." In short, the eighteenth-century police added a disciplinary function to its role as the auxiliary of justice in the pursuit of criminals and as an instrument for the political supervision of plots, opposition movements, or revolts. It was a complex function since it linked the absolute power of the monarch to the lowest levels of power disseminated in society; since, between these different, enclosed institutions of discipline (workshops, armies, schools), it extended an intermediary network, acting where they could not intervene, disciplining the non-disciplinary spaces; but it filled in the gaps, linked them together, guaranteed with its armed force an interstitial discipline and a meta-discipline. "By means of a wise police, the sovereign accustoms the people to order and obedience."¹⁷

The organization of the police apparatus in the eighteenth century sanctioned a generalization of the disciplines that became coextensive with the state itself. Although it was linked in the most explicit way with everything in the royal power that exceeded the exercise of regular justice, it is understandable why the police offered such slight resistance to the rearrangement of the judicial power; and why it has not ceased to impose its prerogatives upon it, with ever-increasing weight, right up to the present day; this is no doubt because it is the secular arm of the judiciary; but it is also because, to a far greater degree than the judicial institution, it is identified, by reason of its extent and mechanisms, with a society of the disciplinary type. Yet it would be wrong to believe that the disciplinary functions were confiscated and absorbed once and for all by a state apparatus.

"Discipline" may be identified neither with an institution nor with an apparatus; it is a type of power, a modality for its exercise, comprising a whole set of instruments, techniques, procedures, levels of application, targets; it is a "physics" or an "anatomy" of power, a technology. And it may be taken over either by "specialized" institutions (the penitentiaries or "houses of correction" of the nineteenth century), or by institutions that use it as an essential instrument for a particular end (schools, hospitals), or by pre-existing authorities that find in it a means of reinforcing or reorganizing their internal mechanisms of power (one day we should show how intra-familial relations, essentially in the parents-children cell, have become "disciplined," absorbing since the classical age external schemata, first educational and military, then medical, psychiatric, psychological, which have made the family the privileged locus of emergence for the disciplinary question of the normal and the abnormal); or by apparatuses that have made discipline their principle of internal functioning (the disciplinarization of the administrative apparatus from the Napoleonic period), or finally by state apparatuses whose major, if not exclusive, function is to assure that discipline reigns over society as a whole (the police).

On the whole, therefore, one can speak of the formation of a disciplinary society in this movement that stretches from the enclosed disciplines, a sort of social "quarantine," to an indefinitely generalizable mechanism of "panopticism." Not because the disciplinary modality of power has replaced all the others; but because it has infiltrated the others, sometimes undermining them, but serving as an intermediary between them, linking them together, extending them and above all making it possible to bring the effects of power to the most minute and distant elements. It assures an infinitesimal distribution of the power relations.

A few years after Bentham, Julius gave this society its birth certificate. Speaking of the panoptic principle, he said that there was much more there than architectural ingenuity: it was an event in the "history of the human mind." In appearance, it is merely the solution of a technical problem; but, through it, a whole type of society emerges. Antiquity had been a civilization of spectacle; "to render accessible to a multitude of men the inspection of a small number of objects": this was the problem to which the architecture of temples, theaters, and circuses responded. With spectacle, there was a predominance of public life, the intensity of festivals, sensual proximity. In these rituals in which blood flowed, society found new vigor and formed for a moment a single great body. The modern age poses the opposite problem: "to procure for a small number, or even for a single individual, the instantaneous view of a great multitude." In a society in which the principal elements are no longer the community and public life, but, on the one hand, private individuals

and, on the other, the state, relations can be regulated only in a form that is the exact reverse of the spectacle: "It was to the modern age, to the ever-growing influence of the state, to its ever more profound intervention in all the details and all the relations of social life, that was reserved the task of increasing and perfecting its guarantees, by using and directing towards that great aim the building and distribution of buildings intended to observe a great multitude of men at the same time."

Julius saw as a fulfilled historical process that which Bentham had described as a technical program. Our society is one not of spectacle, but of surveillance; under the surface of images, one invests bodies in depth; behind the great abstraction of exchange, there continues the meticulous, concrete training of useful forces; the circuits of communication are the supports of an accumulation and a centralization of knowledge; the play of signs defines the anchorages of power; it is not that the beautiful totality of the individual is amputated, repressed, altered by our social order, it is rather that the individual is carefully fabricated in it, according to a whole technique of forces and bodies. We are much less Greeks than we believe. We are neither in the amphitheater, nor on the stage, but in the panoptic machine, invested by its effects of power, which we bring to ourselves since we are part of its mechanism. The importance, in historical mythology, of the Napoleonic character probably derives from the fact that it is at the point of junction of the monarchical, ritual exercise of sovereignty and the hierarchical, permanent exercise of indefinite discipline. He is the individual who looms over everything with a single gaze which no detail, however minute, can escape: "You may consider that no part of the Empire is without surveillance, no crime, no offense, no contravention that remains unpunished, and that the eye of the genius who can enlighten all embraces the whole of this vast machine, without, however, the slightest detail escaping his attention." At the moment of its full blossoming, the disciplinary society still assumes with the Emperor the old aspect of the power of spectacle. As a monarch who is at one and the same time a usurper of the ancient throne and the organizer of the new state, he combined into a single symbolic, ultimate figure the whole of the long process by which the pomp of sovereignty, the necessarily spectacular manifestations of power, were extinguished one by one in the daily exercise of surveillance, in a panopticism in which the vigilance of intersecting gazes was soon to render useless both the eagle and the sun.

The formation of the disciplinary society is connected with a number of broad historical processes - economic, juridico-political, and, lastly, scientific - of which it forms part.

1 Generally speaking, it might be said that the disciplines are techniques for assuring the ordering of human multiplicities. It is true that there is nothing exceptional or even characteristic in this; every system of power is presented with the same problem. But the peculiarity of the disciplines is that they try to define in relation to the multiplicities a tactics of power that fulfills three criteria: firstly, to obtain the exercise of power at the lowest possible cost (economically, by the low expenditure it involves; politically, by its discretion, its low exteriorization, its relative invisibility, the little resistance it arouses); secondly, to bring the effects of this social power to their maximum intensity and to extend them as far as possible, without either failure or interval; thirdly, to link this "economic" growth of power with the output of the apparatuses (educational, military, industrial, or medical) within which it is exercised; in short, to increase both the docility and the utility of all the elements of the system. This triple objective of the disciplines corresponds to a well-known historical con-

juncture. One aspect of this conjuncture was the large demographic thrust of the eighteenth century; an increase in the floating population (one of the primary objects of discipline is to fix; it is an anti-nomadic technique); a change of quantitative scale in the groups to be supervised or manipulated (from the beginning of the seventeenth century to the eve of the French Revolution, the school population had been increasing rapidly, as had no doubt the hospital population; by the end of the eighteenth century, the peace-time army exceeded 200,000 men). The other aspect of the conjuncture was the growth in the apparatus of production, which was becoming more and more extended and complex; it was also becoming more costly and its profitability had to be increased. The development of the disciplinary methods corresponded to these two processes, or rather, no doubt, to the new need to adjust their correlation. Neither the residual forms of feudal power nor the structures of the administrative monarchy, nor the local mechanisms of supervision, nor the unstable, tangled mass they all formed together could carry out this role: they were hindered from doing so by the irregular and inadequate extension of their network, by their often conflicting functioning, but above all by the "costly" nature of the power that was exercised in them. It was costly in several senses: because directly it cost a great deal to the Treasury; because the system of corrupt offices and farmed-out taxes weighed indirectly, but very heavily, on the population; because the resistance it encountered forced it into a cycle of perpetual reinforcement; because it proceeded essentially by levying (levying on money or products by royal, seigniorial, ecclesiastical taxation; levying on men or time by *corvees* of press-ganging, by locking up or banishing vagabonds). The development of the disciplines marks the appearance of elementary techniques belonging to a quite different economy: mechanisms of power which, instead of proceeding by deduction, are integrated into the productive efficiency of the apparatuses from within, into the growth of this efficiency and into the use of what it produces. For the old principle of "levying-violence," which governed the economy of power, the disciplines substitute the principle of "mildness-production-profit." These are the techniques that make it possible to adjust the multiplicity of men and the multiplication of the apparatuses of production (and this means not only "production" in the strict sense, but also the production of knowledge and skills in the school, the production of health in the hospitals, the production of destructive force in the army).

In this task of adjustment, discipline had to solve a number of problems for which the old economy of power was not sufficiently equipped. It could reduce the inefficiency of mass phenomena: reduce what, in a multiplicity, makes it much less manageable than a unity; reduce what is opposed to the use of each of its elements and of their sum; reduce everything that may counter the advantages of number. That is why discipline fixes; it arrests or regulates movements; it clears up confusion; it dissipates compact groupings of individuals wandering about the country in unpredictable ways; it establishes calculated distributions. It must also master all the forces that are formed from the very constitution of an organized multiplicity; it must neutralize the effects of counter-power that spring from them and which form a resistance to the power that wishes to dominate it: agitations, revolts, spontaneous organizations, coalitions - anything that may establish horizontal conjunctions.

Hence the fact that the disciplines use procedures of partitioning and verticality, that they introduce, between the different elements at the same level, as solid

separations as possible, that they define compact hierarchical networks, in short, that they oppose to the intrinsic, adverse force of multiplicity the technique of the continuous, individualizing pyramid. They must also increase the particular utility of each element of the multiplicity, but by means that are the most rapid and the least costly, that is to say, by using the multiplicity itself as an instrument of this growth. Hence, in order to extract from bodies the maximum time and force, the use of those overall methods known as time-tables, collective training, exercises, total and detailed surveillance. Furthermore, the disciplines must increase the effect of utility proper to the multiplicities, so that each is made more useful than the simple sum of its elements: it is in order to increase the utilizable effects of the multiple that the disciplines define tactics of distribution, reciprocal adjustment of bodies, gestures and rhythms, differentiation of capacities, reciprocal coordination in relation to apparatuses or tasks. Lastly, the disciplines have to bring into play the power relations, not above but inside the very texture of the multiplicity, as discreetly as possible, as well articulated on the other functions of these multiplicities and also in the least expensive way possible: to this correspond anonymous instruments of power, coextensive with the multiplicity that they regiment, such as hierarchical surveillance, continuous registration, perpetual assessment and classification. In short, to substitute for a power that is manifested through the brilliance of those who exercise it, a power that insidiously objectifies those on whom it is applied; to form a body of knowledge about these individuals, rather than to deploy the ostentatious signs of sovereignty. In a word, the disciplines are the ensemble of minute technical inventions that made it possible to increase the useful size of multiplicities by decreasing the inconveniences of the power which, in order to make them useful, must control them. A multiplicity, whether in a workshop or a nation, an army or a school, reaches the threshold of a discipline when the relation of the one to the other becomes favorable.

If the economic take-off of the West began with the techniques that made possible the accumulation of capital, it might perhaps be said that the methods for administering the accumulation of men made possible a political take-off in relation to the traditional, ritual, costly, violent forms of power, which soon fell into disuse and were superseded by a subtle, calculated technology of subjection. In fact, the two processes - the accumulation of men and the accumulation of capital - cannot be separated; it would not have been possible to solve the problem of the accumulation of men without the growth of an apparatus of production capable of both sustaining them and using them; conversely, the techniques that made the cumulative multiplicity of men useful accelerated the accumulation of capital. At a less general level, the technological mutations of the apparatus of production, the division of labor and the elaboration of the disciplinary techniques sustained an ensemble of very close relations.² Each makes the other possible and necessary; each provides a model for the other. The disciplinary pyramid constituted the small cell of power within which the separation, coordination, and supervision of tasks was imposed and made efficient; and analytical partitioning of time, gestures, and bodily forces constituted an operational schema that could easily be transferred from the groups to be subjected to the mechanisms of production; the massive projection of military methods onto industrial organization was an example of this modeling of the division of labor following the model laid down by the schemata of power. But, on the other hand, the technical analysis of the process of production, its "mechanical" breaking-down, were pro-

jected onto the labor force whose task it was to implement it: the constitution of those disciplinary machines in which the individual forces that they bring together are composed into a whole and therefore increased is the effect of this projection. Let us say that discipline is the unitary technique by which the body is reduced as a "political" force at the least cost and maximized as a useful force. The growth of a capitalist economy gave rise to the specific modality of disciplinary power, whose general formulas, techniques of submitting forces and bodies, in short, "political anatomy," could be operated in the most diverse political regimes, apparatuses, or institutions.

2 The panoptic modality of power - at the elementary, technical, merely physical level at which it is situated - is not under the immediate dependence or a direct extension of the great juridico-political structures of a society; it is nonetheless not absolutely independent. Historically, the process by which the bourgeoisie became in the course of the eighteenth century the politically dominant class was masked by the establishment of an explicit, coded, and formally egalitarian juridical framework, made possible by the organization of a parliamentary, representative regime. But the development and generalization of disciplinary mechanisms constituted the other, dark side of these processes. The general juridical form that guaranteed a system of rights that were egalitarian in principle was supported by these tiny, everyday, physical mechanisms, by all those systems of micro-power that are essentially non-egalitarian and asymmetrical that we call the disciplines. And although, in a formal way, the representative regime makes it possible, directly or indirectly, with or without relays, for the will of all to form the fundamental authority of sovereignty, the disciplines provide, at the base, a guarantee of the submission of forces and bodies. The real, corporal disciplines constituted the foundation of the formal, juridical liberties. The contract may have been regarded as the ideal foundation of law and political power; panopticism constituted the technique, universally widespread, of coercion. It continued to work in depth on the juridical structures of society, in order to make the effective mechanisms of power function in opposition to the formal framework that it had acquired. The "Enlightenment," which discovered the liberties, also invented the disciplines.

Some Call it Fiction: On the Politics of Domesticity

Nancy Armstrong

Drawing on Foucault's description of the historical evolution of discipline in Western societies, Nancy Armstrong makes links between Victorian novels about the domestic realm and the historical context of nineteenth-century England in this 1990 essay. She is especially interested in the way gender is defined during this period when a new sense of division between a male public sphere and a female domestic sphere was being reinvented and promoted to a position of cultural legitimacy.

It is queer how out of touch with truth women are. They live in a world of their own, and there has never been anything like it, and never can be.

Joseph Conrad, *Heart of Darkness*

For some years now, American scholars have been puzzling out the relationship between literature and history. Apparently the right connections were not made when literary histories were first compiled. Yet in turning to the question of how some of the most famous British novelists were linked to their moment in time, I have found I must begin at step one, with extremely powerful conventions of representation. Though old and utterly familiar, nothing new has taken their place. Their potency has not diminished in this country despite the theory revolution and the calls for a new literary history that came in its wake. The conventions to which I refer are many and various indeed, but all reinforce the assumption that history consists of economic or political events, as if these were essentially different from other cultural events. Some of us - a distinct minority, to be sure - feel that to proceed on this assumption is to brush aside most of the activities composing everyday life and so shrink the category of "the political" down to a very limited set of cultural practices. And then, having classified most of our symbolic activities as "personal," "social," or "cultural" (it is all much the same), traditional histories would have us place them in a secondary relationship either to the economy or to the official institutions of state. This essay is written in opposition to models of history that confine political practices to activities directly concerned with the marketplace, the official institutions of the state, or else resistance to these. I write as one who feels that such models have not provided an adequate basis for understanding the formation of a modern bureaucratic culture or for our place, as intellectuals, within it. More than that, I regard any model that places personal life in a separate sphere and that grants literature a secondary and passive role in political

history as unconsciously sexist. I believe such models necessarily fail to account for the formation of a modern bureaucratic culture because they fail to account for the place of women within it.

Some of our best theorizers of fiction's relationship to history - Raymond Williams in England and Edward Said in the United States - have done much to tear down the barrier between culture and state. They demonstrate that the middle-class hegemony succeeded in part because it constructed separate historical narratives for self and society, family and factory, literature and history. They suggest that by maintaining these divisions within culture, liberal intellectuals continue to sanitize certain areas of culture - namely, the personal, domestic, and literary. The practices that go by these names consequently appear to be benignly progressive, in their analyses, to provide a place of escape from the political world, and even to offer forms of resistance. Still, I would argue, such efforts as those of Williams and Said will be only partially successful so long as they continue to ignore *the sexual division of labor* that underwrites and naturalizes the difference between culture and politics.

The Limits of Political History

To put some life into all these abstractions, let me now turn to domestic fiction and the difficulties that scholars encounter when they try to place writing of this kind in history. Ian Watt convincingly describes the socioeconomic character of the new readership for whom Defoe, Richardson, and Fielding wrote, a readership whose rise in turn gave rise to the novel. But Watt has no similar explanation for Austen. Her popularity he ascribes to her talent, and her talent, to nature. And so he concludes that nature must have given Austen a good eye for details. Although Williams moves well beyond such reflection theories in his groundbreaking account of the information revolution, his model of history ultimately serves us no better than Watt's when it comes to explaining domestic fiction. His *Long Revolution* regards intellectual labor as a political force in its own right without which capitalism could not have unfolded as smoothly and completely as it appears to have done. But however much power Williams grants this domain, it belongs to culture and, as such, exists in a secondary relationship with political history. To historicize writing, he feels compelled to give it a source in events outside of and prior to writing. He does not entertain the possibility that the classic unfolding of capitalism was predicated on writing, much less on writing by women or writing that appealed to the interests of a female readership. For Williams as for Watt, historical events take place in the official institutions of state or else through resistance to these institutions, and both forms of power are exercised primarily through men.

I have found Watt and Williams especially helpful for establishing links between the history of fiction and the rise of the new middle classes in England. At the same time, I am perplexed to find that, in establishing a relationship between writing and political history, these otherwise conscientious scholars completely neglect to account for the most obvious fact of all, namely, that sometime during the eighteenth century, in the words of Virginia Woolf, "the middle class woman began to write." If, as Watt and Williams say, the rise of the novel was directly related to the rise of the new middle classes, then some of our best literary evidence suggests that the rise of the novel was related to the emergence of women's writing as well. In drawing this

equation, of course, I have doubled the difficulties entailed in historicizing fiction, for I have suggested that to historicize fiction we must politicize not only intellectual labor but female labor as well. Much of British fiction exists at the intersection of these two definitively modern subsets of culture and is thereby twice removed from the mainstream of political history.

The writing I call domestic fiction is gender-inflected writing. Unlike the work of earlier women of letters, it comes to us as women's writing. In designating certain forms of writing as feminine, it designates other writing as masculine. The enclosure that marks a Jane Austen novel does not simply distinguish her "world" from that of a Shakespeare, a Blake, a Dickens, or a Yeats. The boundaries it constructs between inside and outside are personal in a far more wide-reaching and historically significant way. They mark the difference between the world over which women novelists have authority - the domain of the personal - and that which is ruled by men and their politics. In doing this, Austen makes Richardson the father of the novel, for, like him, she identifies the work of the novelist with the writing of women as well as with other forms of labor that are suitably feminine.⁴ To move beyond the impasse that prevents us from situating this work in history, we have it seems to me, to toss out the idea that the gendering of vast areas of culture was a consequence of political events over which men had control. To consider gender itself as a political formation over which modern cultures gave women authority, we will have to invert these priorities. Having done so, one comes face to face with the possibility that a revolution in the home preceded the spread of the factory system and all that hinged upon its becoming the means of distributing the wealth of the nation.

To deal with this possibility, I begin with the proposition Marx put forth in *The German Ideology* and Gramsci later developed into the concept of "hegemony" in his essays on the formation of intellectuals and the organization of culture and education: no political revolution is complete without a cultural revolution. To dominate, the dominant group must offer to one and all a view that makes their form of domination seem true and necessary if not desirable and right. Gramsci developed the contradiction inherent in Marx's notion of labor - that labor was not only a commodity, but also a social practice - into a theory that stressed the double-sidedness of middle-class power: it controlled not only the physical dimension of production but also the social dimension. During the twentieth century, moreover, Gramsci could see that a form of power that worked through spatial location, supervision, and individuals' relationship with machines was giving way to something more ubiquitous - bureaucratic control that divided and hierarchized individuals so as to place their labor on separate social planes. And indeed, as the wage was generalized to include members of this and other bureaucracies, those who performed productive labor shrank in number and importance.

More recently, therefore, a number of us who work in the humanities and social sciences have begun to feel theories of resistance which depend upon an essentialized class or, for that matter, any other essentialized group will no longer do. Once taken up by theory, such essentialisms quickly cease to represent the possibility of power coalescing outside a pluralistic society. Rather, they identify contradictory positions within that system and, in so doing, only supply more differences in a differential system that exists on an abstract plane of ideas. The system to which I refer is no system in the abstract, however, but the disciplinary institution itself. Slouching by way of homology from one cultural site to another, it has achieved the status of a

paradigm. In its atomizing structure, political issues get lost. Everything matters. All truths are equivalent - only some are more complex and, in this respect alone, more satisfying than others. In the maze of differences, the difference between positive and negative has all but disappeared, and the paradise of liberalism seems near at hand.

So perceiving *her* historical moment, one can consider in a radically materialist light the Foucauldian propositions that the modern state was called into being in writing, exists mainly as a state of mind, and perpetuates itself through the well-orchestrated collection, regulation, and dissemination of information. The idea of order that Foucault sometimes calls "discourse" or "power" and at other times names "sexuality" or "discipline" is indeed a ruling idea. But in a world that is ruled more surely by ideas than by physical or economic means, one has to be especially careful not to hypothesize some corresponding "reality" as their source. We cannot grant these ideas the autonomy, universality, and mystic interconnection that they have achieved, but neither can we seek out some more primary truth behind or below them. Rather, we must understand them, as Foucault suggests, as the self-conception of a class that has achieved hegemony. And hegemony, in the case of modern post-industrial societies, depends on self-conceptions capable of swallowing up all opposition in a single system of micro-differences.

The power of the system depends upon the production of a particular form of consciousness that is at once unique and standardizing. In place of what he calls the "repressive hypothesis," the assumption that culture either "suppresses" or "imposes itself on" the individual's desire, Foucault offers a productive hypothesis that turns this commonplace on its ear. The first volume of *The History of Sexuality* argues that the very forms of subjectivity we consider most essential to ourselves as selves had no existence prior to their symbolization, that the deepest and most private recesses of our being are culturally produced. His *Discipline and Punish* mounts a detailed historical argument to show that the truth of the modern individual existed first as writing, before she or he was transformed successively into speech, thought, and unconscious desire. Thus Foucault enables us to see the European Enlightenment as a revolution in words, which gave writing a new and awesome power over the world of objects as it shaped the individuals who established a relationship with that world through reading. In England, I would like to suggest, this cultural revolution was the only kind of revolution to occur during the eighteenth century, because in England the revolution in words took a form that prevented popular revolution.

Having torn down the conceptual barrier between writing and political history, we have cleared the way to see the intellectual labor of women as part of the mainstream of political events. Foucault will not help us achieve this particular step, however. His *History of Sexuality* is not concerned with the history of gender. Nor does it deal with the role that writing for, by, and about women played in the history of sexuality. For this reason, his procedures cannot identify the decisive events that detached family life from politics, and these are the very events that tie the formation of a domestic domain to the development of an institutional culture in England. Foucault's *Discipline and Punish* overlooks the fact that the modern household served as the groundbreaking prototype of modern institutions. His *History of Sexuality* neglects to theorize the power of that prototype as it spills over from this account of modern personal life into his account of institutional power to saturate and make intelligible the theory of discipline. Despite the anti-Cartesian thrust of his work, Foucault does not finally break through the barrier that separates his position as

theorizer of the sexual subject in *The History of Sexuality* from the one he takes up in order to theorize the political subject in *Discipline and Punish*. Yet not only does he use the same figure to think out the two; he also gives the strategies producing the sexual subject (those organizing the home) priority in his thinking over the strategies that subject the individual to the state (those of disciplinary institutions).

Central to the central chapter on "Panopticism" in *Discipline and Punish* is Foucault's figure of the city under plague. In contrast with leprosy, which calls for exclusionary strategies more consistent with the aristocratic imagination of power, the plague, as he plays with the figure, seems to require inclusion and enclosure as preconditions for a modern system of surveillance. The division of the population into progressively smaller subdivisions of which the household is the basic module, is followed by the ritual purification of each and every household:

Five or six days after the beginning of the quarantine, the process of purifying the houses one by one is begun. All the inhabitants are made to leave; in each room "the furniture and goods" are raised from the ground or suspended from the air; perfume is poured around the room; after carefully sealing the windows, doors and even the keyholes with wax, the perfume is set alight. Finally, the entire house is closed while the perfume is consumed; those who have carried out the work are searched, as they were on entry, "in the presence of the residents of the house, to see that they did not have something on their persons as they left that they did not have on entering." Four hours later, the residents are allowed to re-enter their homes, (p. 197)

Such enclosure and purification of the house produces a new household free from the taint of any unregulated intercourse with the world, its membrane permeable only to certain kinds of information. Reading this account of the plague, I am struck by the difference between its place in the modern imagination and its use by Boccaccio, who imagined a small aristocratic community safely ensconced in the country to pass the time free from the infection of the city. In this early modern world, those who remain in the city are to be regarded as a different social body altogether, behaving much like the riotous and grotesquely permeable body celebrated by Bakhtin. How significant, then, that Foucault, in contrast with Bakhtin, imagines a city purified from the inside out by the production of hygienically pure domestic spaces within the body politic! In this attempt to fantasize the present from the position of the past, households serve as magical spaces where people go to die in order that they may be reborn as modern individuals - enclosed and self-regulating.

Having pursued the internal logic of his figure thus far, Foucault extends it outward from the newly enclosed domestic world - as from a new source of power - into the cultural and political domains, and from there into history. First, he notes how a "whole literary fiction of the festival grew up around the plague: suspended laws, lifted prohibitions, the frenzy of passing time, bodies mingling together without respect, individuals unmasked, abandoning their statutory identity and the figure under which they had been recognized, allowing a quite different truth to appear. But," he continues, "there was also a political dream of the plague, which was exactly its reverse: not the collective festival, but strict divisions; not laws transgressed, but the penetration of regulation into even the smallest details of everyday life...; not masks that were put on and taken off, but the assignment to each individual of his 'true' name, his 'true' place, his 'true' disease" (pp. 197-8). On the metaphor of the city under plague thus rests Foucault's entire theory of the

development of modern institutions: "If it is true that the leper gave rise to rituals of exclusion, which to a certain extent provided the model for and general form of the Great Confinement, then the plague gave rise to disciplinary projects" (p. 198). Metaphorical use of disease allows him to declare the eighteenth-century hospital with its anatomy theater as the historical prototype for the modern prison.

And to be sure, *I like* Foucault for transgressing the boundary between the therapeutic and the punitive to demonstrate how much they have in common. But this, to my mind, is also a way of avoiding the full implications of his chosen metaphor, the city under plague, implications that would destroy the differences between sexual subject and political subject, and between these and the subject's material body, all of which rest upon preserving the line that divvies up cultural information according to gender. This is the line between inside and outside that is implanted in his metaphor from the beginning to distinguish personal from political life. This is the first division of the conceptual zygote, the line without which the fantasy of an entire political world cannot develop its inexorable symmetry, a symmetry that cuts beneath and through particular features that culture manifests at one site rather than another. While he opens the category of political power considerably by including institutions other than those officially charged to distribute wealth and power, Foucault extends the cultural scope of discipline only so far as institutions that, in becoming institutions, came to be dominated by men. Thus if power does not originate in the minds of individual men or in the bodies of men collectively, it arises from the cultural patterns that make men think of themselves as certain kinds of men and exercise power accordingly.

But if one pursues the implications of Foucault's chosen metaphor for modern power, his city under plague, in contrast with a Boccaccian remedy, contains a certain form of household that is the perfect and obvious answer to the indiscriminate mingling of bodies spreading the infection. When we expand our concept of the political further even than Foucault's, we discover grounds on which to argue that the modern household rather than the clinic provided the proto-institutional setting where government through relentless supervision first appeared, and appeared in its most benevolent guise. Foucault never takes note of these continuities between home and state even though they are as plain as the words on his page. More curious still is his failure to acknowledge the fact that a home espoused by various subgroups aspiring for the status of "respectability," a home overseen by a woman, actually preceded the formation of other social institutions by at least fifty years. There is little to suggest this household took root in practice much before the beginning of the nineteenth century, even though it frequently appeared in the literature and political argumentation of the previous century. From writing, it can be argued, the new family passed into the realm of common sense, where it came to justify the distribution of national wealth through wages paid to men. Indeed, it remains extremely powerful to this day as both metaphor and metonymy, the unacknowledged model and source of middle-class power.

The Power of Domesticity

It is at this point in my argument that a feminist perspective must be invoked, but it cannot be a feminism that sinks comfortably into the rhetoric of victimization. It has

to be thoroughly politicized. By this I mean we must be willing to accept the idea that, as middle-class women, we are empowered, although we are not empowered in traditionally masculine ways. We have to acknowledge that as middle-class intellectuals we are not critical mirrors of a separate and more primary process orchestrated by others - be they politicians, bureaucrats, captains of industry, or simply men. As women intellectuals we are doubly implicated in the process of reproducing the state of mind upon which other openly and avowedly political institutions depend. It is on this basis that I reject the notion that women's writing exists in a domain of experience outside of political history. I can no longer accept what conventional histories assume - that such writing occupies the secondary status of a "reflection" or "consequence" of changes within more primary social institutions - the army, hospital, prison, or factory. To the contrary, my evidence reveals domestic fiction actively disentangled the language of sexual relations from that of political economy. The rhetoric of this fiction (in Wayne Booth's sense of the term) laid out a new cultural logic that would eventually become common sense, sensibility, and public opinion. In this way, female knowledge successfully combatted one kind of power, based on title, wealth, and physical force, with another, based on the control of literacy. By equating good reading with what was good for women readers, a new standard for reading laid down the semantic ground for common sense and established the narrative conventions structuring public opinion. The new standard of literacy helped to bring a new class of people into existence. This class laid claim to the right to privacy on behalf of each individual. Yet this class set in motion the systematic invasion of private life by surveillance, observation, evaluation, and remediation. In a word, it ruled, still rules, through countless microtechniques of socialization, all of which may be lumped together under the heading of education.¹¹ During the second half of the nineteenth century, institutions were created to perform these operations upon masses of people in much the same way as domestic fiction did upon characters.

Those of us who have grown up within an institutional culture consequently carry around a voice much like that of a fictional narrator in his or her head. Sensitive to the least sign of disorder - a foul word, a piece of clothing undone, some food sliding off one's fork, or, worse still, some loss of control over bodily functions - the presence of this voice, now nearly two hundred years old, more surely keeps us in line than fear of the police or the military. For the unofficial forms of power have a terrible advantage over those which are openly and avowedly regulatory. They make us afraid of ourselves. They operate on the supposition that we harbor desires dangerous to the general good. Believing in the presence of a self that is essentially subversive, we keep watch over ourselves - in mirrors, on clocks, on scales, through medical exams, and by means of any number of other such practices. Thus we internalize a state that is founded on the conflict between self and state interests, and we feel perfectly justified in enacting its power - which is, after all, only good for oneself - upon others.

Convinced that power exerted in and through the female domain is at least as powerful as the more conventional forms of power associated with the male, I want to sketch out the relationship between the two during the modern period. I will suggest that modern institutional cultures depend upon the separation of "the political" from "the personal" and that they produce and maintain this separation on the basis of gender - the formation of masculine and feminine domains of culture. For, I will argue, even as certain forms of cultural information were separated into these

two opposing fields, they were brought together as an intricate set of pressures that operated on the subject's body and mind to induce self-regulation. We can observe this peculiarly effective collaboration of the official and unofficial forms of power perhaps most clearly in the formation of a national education system during the Victorian period and in the whole constellation of efforts that went on simultaneously to appropriate leisure time.¹² British fiction participates in both efforts and therefore demonstrates the modes of collaboration between them.

To introduce their highly influential *Practical Education* in 1801, Maria Edgeworth and her father announce their break with the curriculum that reinforced traditional political distinctions: "On religion and politics we have been silent because we have no ambition to gain partisans, or to make proselytes, and because we do not address ourselves to any sect or party." In virtually the same breath, they assure readers, "With respect to what is commonly called the education of the heart, we have endeavored to suggest the easiest means of inducing useful and agreeable habits, well regulated sympathy and benevolent affections" (p. viii). Their program substitutes abstract terms of emotion and behavior for those of one's specific socioeconomic identity. Rooting identity in the very subjective qualities that earlier curricula had sought to inculcate in young women alone, the Edgeworths' program gives priority to the schoolroom and parlor over the church and courts for purposes of regulating human behavior. In doing this, their educational program promises to suppress the political signs of human identity (which is of course a powerful political gesture in its own right). Perfectly aware of the power to be exercised through education, the Edgeworths justify their curriculum for cultivating the heart on grounds that it offered a new and more effective method of policing. In their words, "It is the business of education to prevent crimes, and to prevent all those habitual propensities which necessarily lead to their commission" (p. 354).

To accomplish their ambitious political goal, the Edgeworths invoke an economy of pleasure which cannot in fact be understood apart from the novel and the criticism that was produced both to censor and to foster it. First, the Edgeworths accept the view prevailing during the eighteenth century which said that fiction was sure to mislead female desire:

With respect to sentimental stories, and books of mere entertainment, we must remark, that they should be sparingly used, especially in the education of girls. This species of reading cultivates what is called the heart prematurely, lowers the tone of the mind, and induces indifference for those common pleasures and occupations which... constitute by far the greatest portion of our daily happiness, (p. 105)

But the same turn of mind could as easily recognize the practical value of pleasure when it is harnessed and aimed at the right goals. Convinced that "the pleasures of literature" acted upon the reader in much the same way as a child's "taste for sugarplums" (p. 80), forward-thinking educators began to endorse the reading of fiction, so long as it was governed by principles that made conformity seem desirable.

In formulating a theory of mass education in which fiction had a deceptively marginal role to play, the Edgeworths and their colleagues were adopting a rhetoric which earlier reformers had used to level charges of violence and corruption against the old aristocracy. They placed themselves in the tradition of radical Protestant

dissent going back to the sixteenth century, a tradition which had always argued that political authority should be based on moral superiority. Sexual relations so often provided the terms for making this claim that no representation of the household could be considered politically neutral. To contest that notion of the state which depended upon inherited power, puritan treatises on marriage and household governance represented the family as a self-enclosed social unit into whose affairs the state had no right to intervene. Against genealogy they posited domesticity. But in claiming sovereignty for the natural father over his household, these treatises were not proposing a new distribution of political power. They were simply trying to limit the monarch's power. To understand the social transformation that was achieved by the English Revolution (according to Christopher Hill, not achieved until more than a century later), we have to turn away from what we consider to be the political themes of the puritan argument and consider instead what happens to gender.¹⁴

According to Kathleen M. Davis, the puritan doctrine of equality insisted upon the difference of sexual roles, in which the female was certainly subordinate to the male, and not upon the equality of the woman in kind. "The result of this partnership," she explains, "was a definition of mutual and complementary duties and characteristics." Gender was so clearly understood in these oppositional terms that it could be graphically represented:

.15

HUSBAND

Get goods
Travel, seek a living
Get money and provisions
Deal with many men
Be "entertaining"
Be skillful in talk
Be a giver
Apparel yourself as you may
Dispatch all things outdoors

WIFE

Gather them together and save them
Keep the house
Do not vainly spend it
Talk with few
Be solitary and withdrawn
Boast of silence
Be a saver
Apparel yourself as it becomes you
Oversee and give order within

In so representing the household as the opposition of complementary genders, the authors of countless puritan tracts asked readers to imagine the household as a self-enclosed social unit. But if these authors wanted to define the family as an independent source of authority, their moment did not arrive. The puritan household consisted of a male and a female who were structurally identical, positive and negative versions of the same thing. The authority of the housewife described above could not yet be imagined as a positive thing in its own right. Until she took up her vigil and began to order personal life, a single understanding of power reigned, and men fought to determine the balance among its various parts.

Unlike the authors of seventeenth-century marriage manuals and domestic economies, the educational reformers of nineteenth-century England could look back on a substantial body of writing whose main purpose was to produce a historically new woman. During the centuries between the English Revolution and the present day, this woman was inscribed with values which appealed to a whole range of competing interest groups, and, through her, these groups seized authority over domestic relations and personal life. In this way, I believe, they created a need for the kind of

surveillance which modern institutions provide. Indeed, the last two decades of the seventeenth century saw an explosion of writing aimed at educating the daughters of the numerous aspiring social groups. The new curriculum promised to educate these women in such a way as to make them more desirable than women who had only their own rank and fortune to recommend them. This curriculum exalted a woman whose value resided chiefly in her femaleness rather than in the traditional signs of status, a woman who possessed emotional depth rather than a physically stimulating surface, one who, in other words, excelled in the very qualities that differentiated her from the male. As gender was redefined in these terms, the woman exalted by an aristocratic tradition of letters ceased to appear so desirable. In becoming the other side of this new sexual coin, she represented surface rather than depth, embodied material as opposed to moral value, and displayed idle sensuality instead of unflagging concern for the well-being of others. So conceived, the aristocratic woman no longer defined what was truly and most desirably female.

But it was not until the mid-nineteenth century that the project of defining people on the basis of gender began to acquire some of the immense political influence it still exercises today. Around the 1830s, one can see the discourse of sexuality relax its critical gaze on the aristocracy as the newly forming working classes became a more obvious target of moral reform. Authors suddenly took notice of social elements who had hardly mattered before. These reformers and men of letters discovered that rebellious artisans and urban laborers, for example, lacked the kind of motivation that supposedly characterized normal individuals. Numerous writers sought out the source of poverty, illiteracy, and demographic change in these underdeveloped individuals, whose behavior was generally found to be not only promiscuous but also ambiguously gendered. Once they succeeded in translating an overwhelming economic problem into a sexual scandal, middle-class intellectuals could step forward and offer themselves, their technology, their supervisory skills, and their institutions of education and social welfare as the appropriate remedy for growing political resistance.

In all fairness, as Foucault notes, the middle classes rarely applied institutional procedures to others without first trying them out on themselves. When putting together a national curriculum, the government officials and educators in charge adopted one modeled on the educational theory that grew up around the Edgeworths and their intellectual circle, the heirs of the dissenting tradition.¹ This was basically the same as the curriculum proposed by eighteenth-century pedagogues and reformers as the best way of producing a marriageable daughter. By the end of the eighteenth century, the Edgeworths were among those who had already determined that the program aimed at producing the ideal woman could be applied to boys just as well as to girls. And by the mid-nineteenth century, one can see the government figuring out how to administer much the same program on a mass basis. In providing the conceptual foundation for a national curriculum, a particular idea of the self thus became commonplace, and as gendered forms of identity determined how people thought of themselves as well as others, that self became the dominant social reality.

Such an abbreviated history cannot do justice to the fierce controversies punctuating the institution of a national education system in England. I simply call attention to this material as a site where political history obviously converged with the history of sexuality as well as with that of the novel to produce a specific kind of individual. I do this to suggest the political implications of representing these as separate narratives. As it began to deny its political and religious bias and to present itself instead

as a moral and psychological truth, the rhetoric of reform obviously severed its ties with an aristocratic past and took up a new role in history. It no longer constituted a form of resistance but enclosed a specialized domain of culture apart from political relations where apolitical truths could be told. The novel's literary status hinged upon this event. Henceforth fiction would deny the political basis for its meaning and refer instead to the private regions of the self or to the specialized world of art but never to the use of words that created and still maintains these distinctions so basic to our culture. Favored among kinds of fiction were novels that best performed the rhetorical operations of division and self-containment and thus turned existing political information into the discourse of sexuality. These works of fiction gave novels a good name, a name free of politics, and often the name of a woman such as Pamela, Evelina, Emma, or Jane Eyre. Then, with the translation of human identity into sexual identity came widespread repression of the political literacy characterizing an earlier culture, and with it, too, mass forgetting that there was a history of sexuality to tell.

The Politics of Domestic Fiction

Let me offer a detailed example of the exchange between reader and literary text to provide a sense of how the power of domesticity works through such an exchange. Charlotte Brontë flaunted this very power in writing her novel *Shirley*. The novel contains an otherwise gratuitous scene where Shakespeare's *Coriolanus* is read aloud and critiqued, as if to give the reader precise rules for reading, rules that should fascinate literary historians. They are not Brontë's own but rules developed during the preceding century by countless authors of ladies' conduct books and educational treatises. These authors proposed the first curriculum to include native British literature. Around the time Brontë sat down to write *Shirley*, a new generation of writers had taken up the question of how to distinguish good reading from bad. Their efforts swelled the growing number of Victorian magazines. Whether or not girls should read novels was the concern that shaped the debates over a curriculum for women during the eighteenth century, then nineteenth-century pedagogical theory developed around the question of how to make fiction useful for teaching foreigners and working-class people as well as women and children. Rules for reading developed along with the national standard curriculum that extended a curriculum originally meant only for girls of the literate classes to young Englishmen and women at various levels and their counterparts throughout the colonies. It is much the same theory of education that informs our educational system today. By using this example from *Shirley* to illustrate the rationale and procedures by which Victorian intellectuals extended what had been regarded as a female form of literacy to male education, I also want to mark an important difference between Charlotte Brontë's understanding of this process and our own. She was, I believe, far more aware of the politics of literary interpretation than we are.

One of her least colorful heroines, Caroline Helstone, uses Shakespeare to while away an evening of leisure with her beloved cousin and future husband, Robert Moore, a surly manufacturer, whose authoritarian way of dealing with factory hands is earning him threats of Luddite reprisals. During this, their one intimate moment together until the end of the novel, they reject all the pastimes available to lovers in

an Austen novel in favor of reading Shakespeare's *Coriolanus*. Far more detailed than any such exchange in earlier fiction, this act of reading spells out the procedures by which reading literature was thought to produce a form of knowledge that was also a form of social control. Robert Moore is half Belgian, half English. It is through reading Shakespeare that, according to Caroline, he "shall be entirely English."¹⁷ For, as she patiently explains to him, "Your French forefathers don't speak so sweetly, nor so solemnly, nor so impressively as your English ancestors, Robert." But being English does not identify a set of political affiliations - as it would in Shakespeare's time. It refers instead to essential qualities of human mind. Caroline has selected a part for Robert to read aloud that, in her words, "is toned with something in you. It shall waken your nature, fill your mind with music, it shall pass like a skillful hand over your heart.... Let glorious William come near and touch it; you will see how he will draw the English power and melody out of its chords."

I have called this relationship between reader and text an exchange in order to stress the fact that writing cannot be turned to the task of constituting readers without giving up old features and acquiring new ones of its own; to dwell on the reader is to explain but one half of the transformational logic of this exchange. Just as Robert, the rude Belgian, becomes a gentle Englishman by reading Shakespeare, so, too, the Jacobean playwright is transformed by the domestic setting in which he is read. Caroline urges Robert to receive the English of another historical moment as the voice of an ancestor speaking to him across time and cultural boundaries. To no one's surprise, the written Shakespeare, thus resurrected, has acquired the yearnings and anxieties of an early nineteenth-century factory owner. And as we observe the Bard becoming the nineteenth-century man, we also witness an early version of our own literary training. Here, extending through the educated middle-class female to the male and, through him, acquiring universal application, we can see how voices that speak from positions vastly different in social space and time quickly translate into aspects of modern consciousness.

Thus Shakespeare becomes the means of reproducing specifically modern states of mind within the reader. Reading Shakespeare is supposed "to stir you," Caroline explains, "to give you new sensations. It is to make you feel your life strongly, not only your virtues, but your vicious, perverse points. Discover by the feeling the reading will give you at once how high and how low you are" (p. 115). If Shakespeare loses the very turns of mind that would identify him with his moment in history, then Robert loses features of a similar kind in Bronte's representation of the scene of reading. And this, of course, is the point. Reading Shakespeare translates Robert's political attitudes into essential features of mind. It simultaneously objectifies those features and subjects them to evaluation. The "English power" that Robert acquires by reading literature is simply the power of observing himself through the lens of liberal humanism - as a self flushed with the grandiosity of an ordinariness that has been totally liberated from historical bias and political commitment. For it is through this lens that the novel has us perceive the transformations that come over Robert as he reads *Coriolanus* under the gentle tutelage of Caroline Helstone: "stepping out of the narrow line of private prejudices, he began to revel in the large picture of human nature, to feel the reality stamped upon the characters who were speaking from that page before him" (p. 116).

Her tutoring induces Robert to renounce one mode of power - which Caroline associates with the imperiously patriarchal nature of *Coriolanus* - and to adopt

another - which she identifies as a benevolent form of paternalism. As it is administered by a woman and used to mediate a sexual exchange, *Coriolanus* becomes the means for effecting historical change: *Coriolanus* becomes Caroline. Performed as writing and reading, that is, the play becomes the means of internalizing a form of authority identified with the female. The political implications of feminizing the reader are clear as Caroline gives Robert a moral to "tack to the play:... you must not be proud to your workpeople; you must not neglect chances of soothing them, and you must not be of an inflexible nature, uttering a request as austere as if it were a command" (p. 114). Brontë is less than subtle in dramatizing the process by which reading rids Robert of the foreign devil. She seems to know exactly what political objective is fulfilled as he fills the mold of the Englishman and benevolent father. Brontë also puts the woman in charge of this process even though she gives her heroine the less imperious passages to read. Retiring, feminine, and thoroughly benign, Caroline's power is hardly visible as such. Yet she is clearly the one who declares that reading has the power "to stir you; to give you new sensations. It is to make you feel your life strongly, not only your virtues, but your vicious, perverse points" (p. 115). And when Robert has finished reading, she is the one to ask, "Now, have you felt Shakespeare?" (p. 117). She suppresses all that belongs to the past as so much noise in her effort to bring under examination the grand currents of emotion that run straight from Shakespeare to the modern day reader, a reader who is thoroughly English. In thus guiding his reading with her smiles and admonitions, Caroline executes a set of delicate procedures capable of translating any and all cultural information into shades of modern middle-class consciousness and the substance of a literary text. Although its setting - during the Luddite rebellions - makes *Shirley* anachronistic by about thirty years, the solution it proposes for the problem of political resistance, through the production of a new ruling-class mentality, marks this novel as utterly Victorian - perhaps even ahead of its time.

As similar textualizing strategies were deployed here and elsewhere throughout Victorian culture, an intricate system of psychological differences completely triumphed over a long-standing tradition of overtly political signs to usher in a new form of state power. This power - the power of representation over the thing represented - wrested authority from the old aristocracy on grounds that a government was morally obliged to rehabilitate deviant individuals rather than subdue them by force. The Peterloo Massacre of 1819 made it clear that the state's capacity for violence had become a source of embarrassment to the state. Overt displays of force worked against legitimate authority just as they did against subversive factions. If acts of open rebellion had justified intervention in areas of society that government had not had to deal with before, then the government's use of force gave credence to the workers' charges of government oppression. The power of surveillance came into dominance at precisely this moment in English history, displacing traditional displays of violence. Remarkably like the form of vigilance that insured an orderly household, this power did not create equality so much as trivialize the material signs of difference by translating all such signs into differences in the quality, intensity, direction, and self-regulatory capability of an individual's desire.

In saying this, I am not suggesting that we should use British fiction to identify forms of repression or to perform acts of liberation, although my project has a definite political goal. I simply want to represent the discourse of sexuality as deeply implicated in - if not directly responsible for - the shape of the novel, and to show

the novel's implication, at the same time, in producing a subject who knew herself and saw that self in relation to others according to the same feminizing strategies that had shaped fiction. I regard fiction, in other words, both as a document and as an agency of cultural history. I believe it helped to formulate the ordered space we now recognize as the household, that it made that space totally functional and used it as the context for representing normal behavior. In doing all this, fiction contested alternative bases for human relationships. As the history of this female domain is figured into political history, then, it will outline boldly the telling cultural move upon which, I believe, the supremacy of middle-class culture ultimately hinged. That is, it will reenact the moment when writing invaded, revised, and contained the household according to strategies that distinguished private from social life and thus detached sexuality from political history.

Where others have isolated rhetorical strategies that naturalize the subordination of female to male, no one has thoroughly examined the figure that differentiates the sexes as it links them together by sexual desire. And if no one asks why, how, and when gender differentiation became the root of human identity, no degree of theoretical sophistication can help us understand the totalizing power of this figure and the very real interests such power inevitably serves. So basic are the terms "male" and "female" to the semiotics of modern life that no one can use them without to some degree performing the very reifying gesture whose operations we need to understand and whose power we want to historicize. Whenever we cast our political lot in the dyadic formation of gender, we place ourselves in a classic double bind, which confines us to alternatives that are not really alternatives at all. That is to say, any political position founded primarily on sexual identity ultimately confirms the limited choices offered by such a dyadic model. Once one thinks within such a structure, sexual relationships appear as the model for all power relationships. This makes it possible to see the female as representative of all subjection and to use her subjectivity as if it were a form of resistance. Having inscribed social conflict within a domestic configuration, however, one loses sight of all the various and contrary political affiliations for which any given individual provides the site. This power of sexuality to appropriate the voice of the victim works as surely through inversion, of course, as by strict adherence to the internal organization of the model.

Still, there is a way in which I owe everything to the very academic feminism I seem to critique, for unless it were now acceptable to read women's texts as women's texts, there would be no call to historicize this area of culture. In view of the fact that women writers have been taken up by the Norton Anthology as part of the standard survey of British literature and also as a collection all of their own, and in view of the fact that we now have male feminists straining to hop on the bandwagon, I feel it is simply time to take stock. It is time to consider why literary criticism presently feels so comfortable with a kind of criticism that began as a critique both of the traditional canon and of the interpretive procedures the canon called forth. This should tell us that by carving out a separate domain for women within literary criticism, feminist criticism has yet to destabilize the reigning metaphysics of sexuality. Literary historians continue to remain aloof from but still firmly anchored in a narrow masculinist notion of politics as more and more areas within literary studies have given ground to the thematics of sexuality promoted by academic feminism. Indeed, a sexual division of labor threatens to reproduce itself within the academy whereby women scholars interpret literature as the expression of the sexual subject while male scholars attend

to matters of history and politics. To subvert this process, I believe we must read fiction not as literature but as the history of gender differences and a means by which we have reproduced a class and culture specific form of consciousness.

Notes

- 1 Ian Watt, *The Rise of the Novel* (Berkeley: University of California Press, 1957), p. 57.
- 2 In *The Long Revolution* (New York: Columbia University Press, 1961), Williams sets out to show how the "creative" or cultural dimension of social experience opposed existing forms of political authority during the seventeenth and eighteenth centuries and won. Part one of his book indeed gives culture priority over the official institutions of state (as it must during the eighteenth century), claiming that cultural history "is more than a department, a special area of change. In this creative area the changes and conflicts of the whole way of life are necessarily involved" (p. 122). But latent in this promise to extend the category of "the political" broadly to include "the whole way of life" is the contradictory suggestion that political practices are also a special category of "the whole." The second notion of politics emerges in part two, where Williams describes such historical processes as the growth of the reading public, of the popular press, and of standard English through which the new middle classes converted the power of language into economic power. Here the narrow definition of political events, as those which take place in the houses of government, the courts, and the marketplace, assumes control over the "creative" cultural dimension of social experience. For example, Williams writes, "as 1688 is a significant political date, so 1695 is significant in the history of the press. For in that year Parliament declined to renew the 1662 Licensing Act, and the stage for expansion was now fully set" (p. 180). Had Williams actually gathered data that would compose the record of "the whole" of life, he might have broken out of this circle. But, in producing cultural histories, he invariably bows to tradition and stops before entering into the female domain.

- 4 For an account of the early eighteenth-century tradition that links the novel to criminal culture, see Lennard Davis, *Factual Fictions: The Origins of the English Novel* (New York: Columbia University Press, 1983), pp. 123-37. For the objection to novels because of their quasi-erotic appeal, see John Richetti, *Popular Fiction Before Richardson's Narrative Patterns 1700-1734* (Oxford: Clarendon, 1969). In an issue of Addison's *Spectator*, for example, Mr. Spectator warns readers about the perils of May, advising that women "be in a particular Manner how they meddle with Romances, Chocolates, Novels, and the like inflamers, which I look upon to be very dangerous to be made use of during this great Carnival of Nature," quoted in *Four Before Richardson: Selected English Novels 1720-1727*, ed. William H. McBurney (Lincoln: University of Nebraska Press, 1963), p. ix. Toward the end of the eighteenth century, however, one discovers a good number of pedagogical treatises echo Austen's *Northanger Abbey* in advocating certain works of fiction as the fitting way to occupy leisure time. The fiction that was supposed to have a salutary effect on young women was either produced by lady novelists that gained currency during the age of Burney and the other lady novelists or else by earlier novelists who celebrated the same domestic virtues and saw the same form of domestic happiness as the ultimate reward for demonstrating these virtues. It was during this time, as Homer O. Brown explains, that certain novels were published under the editorship of Scott and Barbauld and marked as polite reading, and on the basis of this limited and anomalous body of works, a history of the novel was constructed backward in time (from his book, *Institutions of the English Novel in the Eighteenth Century*).
- 5 A number of social historians have suggested that the factory system, and with it the economic domination of the new middle classes, was stalled until the beginning of the nineteenth century. In *The Making of the English Working Class* (New York: Random House, 1966) p. 198, E. P. Thompson suggests that fear of Jacobinism produced a new alignment between landowners and industrialists that divided the traditional resistance to industrialization. In *The Machinery*

Question and the Making of Political Economy (Cambridge: Cambridge University Press, 1980), Maxine Berg explains how the development of political economy as a problem-solving logic at the end of the eighteenth century helped to make industrialization seem like an answer rather than a problem to be avoided at all costs. It was under such conditions that various authors first saw how many people had economic interests in common with the industrialists and described them as a class. In *Desire and Domestic Fiction: A Political History of the Novel* (New York: Oxford University Press, 1987), I carry this argument further by suggesting that well before they felt they had economic interests in common, numerous social groups ranging between the lower gentry and skilled workers were persuaded, in large part by authors unknown to us today, to buy into a single notion of personal life that centered around the kind of woman one desired to marry and the sort of happiness she would provide (pp. 59-95).

- 6 In discussing Feuerbach, Marx not only stresses that the "ruling ideas" of an epoch are the ideas of a ruling class who "regulate the production and distribution of ideas of their age" (p. 64). He also speculates that during the modern epoch, the production and distribution of ideas (i.e., the production of consciousness) will become increasingly important to the preservation of the bourgeois "state" and to its eventual disintegration or overthrow, *The German Ideology*, Part One, ed. C. J. Arthur (New York: International Publishers, 1985). Without sliding back into the idealist philosophy from which Marx sought to rescue "the production of ideas," Gramsci applies the contradiction inherent in Marx's notion of labor to intellectual labor. The intellectual does not necessarily identify with the ruling class by reproducing the ideas inherited from the past but at certain moments may expand their political horizon by lending unity and coherence to the view of an emergent group, *The Modern Prince and Other Writings* (New York: International Publishers, 1957). In *Hegemony and Socialist Strategy*, trans. Winston Moore and Paul Cammack (London: Verso, 1985), Ernesto Laclau and Chantal Mouffe update this principle for a postmodern society by broadening Gramsci's notions of both power and resistance. Where the difference between production in the traditional sense and the production of information has virtually disappeared, the antagonism between worker and owner is likewise dispersed. Where such polarities could once be taken for granted, then, it becomes extremely difficult to create polarities along political lines. Laclau and Mouffe find it necessary to depart from Gramsci's reliance on the emergence of labor in conflict with capital and to turn instead to the intellectual labor of negativities and positivities out of the contemporary swamp of equivalences. For another important analysis of power in postmodern society, see Bona Ventura de Sousa Santos, "Law and Community: The Changing Nature of State Power in Late Capitalism," *International Journal of the Sociology of the Law* (1980), 8: 379-97.

- 8 *Discipline and Punish: The Birth of the Prison*, trans. Alan Sheridan (New York: Vintage, 1979). All citations are to this edition.
- 9 In *The Imaginary Puritan: Literature and the Origins of Personal Life* (Berkeley: University of California Press, 1992), Leonard Tennenhouse and I explain at length how the English Revolution failed to produce the base transformations that mark political revolution. We argue for a more adequate definition of the political, showing that while political change, in the narrow sense of the term, failed to occur, cultural change was profound and lasting. Before the modern middle classes gained economic control, and well before they gained control of the Houses of Parliament, a new class of intellectuals gained hegemony over aristocratic culture as it translated puritanism into the secular practices composing modern domesticity and personal life.
- 10 I have argued this at length in *Desire and Domestic Fiction*. This essay began as an early version of the introduction and later developed into a theoretical investigation of my argument with literature, history, and academic feminism. I refer readers to the book for evidence supporting the necessarily brief outline of the events in the history of modern sexuality which composes part of this essay.
- 11 In "The Mother Made Conscious": The Historical Development of a Primary School Pedagogy," *History Workshop* (1985), vol. 20, Carolyn Steedman has researched the rationale and

analyzed the process by which the techniques of mothering were extended beyond the household and, through the establishment of a national educational system, became the gentle but unyielding girders of a new institutional culture.

Professing the Renaissance: The Poetics and Politics of Culture

Louis Montrose

In this key essay of the "New Historicism," published in 1989, Louis Montrose outlines some of the important assumptions of this body of work. He emphasizes the role of Post-Structuralism, especially deconstruction, in influencing the New Historicist concern with what Montrose calls the "textuality of history."

There has recently emerged within Renaissance studies, as in Anglo-American literary studies generally, a renewed concern with the historical, social, and political conditions and consequences of literary production and reproduction: The writing and reading of texts, as well as the processes by which they are circulated and categorized, analyzed and taught, are being reconstrued as historically determined and determining modes of cultural work; apparently autonomous aesthetic and academic issues are being reunderstood as inextricably though complexly linked to other discourses and practices - such linkages constituting the social networks within which individual subjectivities and collective structures are mutually and continuously shaped. This general reorientation is the unhappy subject of J. Hillis Miller's 1986 Presidential Address to the Modern Language Association. In that address, Miller noted with some dismay - and with some hyperbole - that "literary study in the past few years has undergone a sudden, almost universal turn away from theory in the sense of an orientation toward language as such and has made a corresponding turn toward history, culture, society, politics, institutions, class and gender conditions, the social context, the material base." By such a formulation, Miller polarizes the linguistic and the social. However, the prevailing tendency across cultural studies is to emphasize their reciprocity and mutual constitution: On the one hand, the social is understood to be discursively constructed; and on the other, language-use is understood to be always and necessarily dialogical, to be socially and materially determined and constrained.

Miller's categorical opposition of "reading" to cultural critique, of "theory" to the discourses of "history, culture, society, politics, institutions, class and gender" seems to me not only to oversimplify both sets of terms but also to suppress their points of contact and compatibility. The propositions and operations of deconstructive reading may be employed as powerful tools of ideological analysis. Derrida himself has recently suggested that, at least in his own work and in the context of European cultural politics, they have always been so: He writes that "deconstructive readings and writings are concerned not only with... discourses, with conceptual and seman-

tic contents.... Deconstructive practices are also and first of all political and institutional practices." The notorious Derridean aphorism, "*il n'y a pas de hors-texte*" ["there is no outside of textuality"] may be invoked to abet an escape from the determinate necessities of history, a self-abandonment to the indeterminate pleasures of the text; however, it may also be construed as an insistence upon the ideological force of discourse in general and of those discourses in particular which reduce the work of discourse to the mere reflection of an ontologically prior, essential or empirical reality.

The multiplicity of unstable, variously conjoined and conflicting discourses that may be said to inhabit the field of post-structuralist theory have in common the problematization of those processes by which meaning is produced and grounded, and a heightened (though, of course, necessarily limited) reflexivity concerning their own assumptions and constraints, their methods and their motives. Miller wholly identifies "theory" with domesticated, politically eviscerated varieties of Deconstruction, which he privileges ethically and epistemologically in relation to what he scorns as "ideology" - that impassioned and delusional condition which "the critics and antagonists of deconstruction on the so-called left and so-called right" (p. 289) are said to share. Although his polemic indiscriminately though not unintentionally lumps them with the academy's intellectually and politically reactionary forces, the various modes of sociopolitical and historical criticism have not only been challenged and influenced by the theoretical developments of the past two decades but have also been vitally engaged in their definition and direction. And one such direction is the understanding that "theory" does not reside serenely above "ideology" but rather is mired within it. Representations of the world in written discourse are engaged in constructing the world, in shaping the modalities of social reality, and in accommodating their writers, performers, readers, and audiences to multiple and shifting subject positions within the world they both constitute and inhabit. Traditionally, "ideology" has referred to the system of ideas, values, and beliefs common to any social group; in recent years, this vexed but indispensable term has in its most general sense come to be associated with the processes by which social subjects are formed, re-formed and enabled to perform as conscious agents in an apparently meaningful world. In such terms, our professional practice, like our subject matter, is a production of ideology: By this I mean not merely that it bears the traces of the professor's values, beliefs, and experiences - his or her socially constructed subjectivity - but also that it actively instantiates those values, beliefs, and experiences. From this perspective, any claim for what Miller calls an "orientation to language as such" is itself -always already - an orientation to language that is being produced from a position within "history, culture, society, politics, institutions, class and gender conditions."

As if to reinforce Miller's sense of a general crisis in literary studies with the arraignment of an egregious example, the issue of PMLA which opens with his Presidential Address immediately continues with an article on the "politicizing" of Renaissance Drama. The latter begins with the ominous warning that "A specter is haunting criticism - the specter of a new historicism." Edward Pechter's parody of *The Communist Manifesto* points toward his claim that, although the label "New Historicism" embraces a variety of critical practices, at its core this project is "a kind of 'Marxist criticism'" - the latter, larger project being characterized in all its forms and variants as a view of "history and contemporary political life as determined, wholly or in essence, by struggle, contestation, power relations, *libido dommandi*"

(p. 292). It seems to me that, on this essentialist definition, such a project might be better labeled as Machiavellian or Hobbesian than as Marxist. In any event, Pechter's specter is indeed spectral, in the sense that it is largely the (mis)construction of the critic who is engaged in attacking it, and thus also in the sense that it has become an object of fascination and dread.

A couple of years ago, I attempted briefly to articulate and scrutinize some of the theoretical, methodological, and political assumptions and implications of the kind of work produced since the late 1970s by those (including myself) who were then coming to be labeled as "New Historicists."⁵ The focus of such work has been upon a refigur-ing of the socio-cultural field within which canonical Renaissance literary and dramatic works were originally produced; upon resituating them not only in relationship to other genres and modes of discourse but also in relationship to contemporaneous social institutions and non-discursive practices. Stephen Greenblatt, who is most closely identified with the label "New Historicism" in Renaissance literary studies, has himself now abandoned it in favor of "Cultural Poetics," a term he had used earlier and one which perhaps more accurately represents the critical project I have described.⁶ In effect, this project reorients the axis of inter-textuality, substituting for the diachronic text of an autonomous literary history the synchronic text of a cultural system. As the conjunction of terms in its title suggests, the interests and analytical techniques of "Cultural Poetics" are at once historicist and formalist; implicit in its project, though perhaps not yet adequately articulated or theorized, is a conviction that formal and historical concerns are not opposed but rather are inseparable.

Until very recently - and perhaps even now - the dominant mode of interpretation in English Renaissance literary studies has been to combine formalist techniques of close rhetorical analysis with the elaboration of relatively self-contained histories of "ideas," or of literary genres and topoi - histories that have been abstracted from their social matrices. In addition to such literary we may note two other traditional practices of "history" in Renaissance literary studies: one comprises those commentaries on political commonplaces in which the dominant ideology of Tudor-Stuart society - the unreliable machinery of socio-political legitimation - is misrecognized as a stable, coherent, and collective Elizabethan world picture, a picture discovered to be lucidly reproduced in the canonical literary works of the age; and the other, the erudite but sometimes eccentric scholarly detective work which, by treating texts as elaborate ciphers, seeks to fix the meaning of fictional characters and actions in their reference to specific historical persons and events. Though sometimes reproducing the methodological shortcomings of such older idealist and empiricist modes of historical criticism, but also often appropriating their prodigious scholarly labors to good effect, the newer historical criticism is new in its refusal of unproblematic distinctions between "literature" and "history," between "text" and "context," new in resisting a prevalent tendency to posit and privilege a unified and autonomous individual - whether an Author or a Work - to be set against a social or literary background.

In the essay of mine to which I have already referred, I wrote merely of a new historical orientation in Renaissance literary studies, because it seemed to me that those identified with it by themselves or by others were actually quite heterogeneous in their critical practices and, for the most part, reluctant to theorize those practices. The very lack of such explicit articulations was itself symptomatic of certain eclectic and empiricist tendencies that threatened to undermine any attempt to distinguish a new historicism from an old one. It may well be that these very ambiguities rendered

New Historicism less a critique of dominant critical ideology than a subject for ideological appropriation, thus contributing to its almost sudden installation as the newest academic orthodoxy, to its rapid assimilation by the "interpretive community" of Renaissance literary studies. Certainly, some who have been identified as exemplary New Historicists now enjoy the material and symbolic tokens of academic success; and any number of New Historicist dissertations, conferences, and publications testify to a significant degree of disciplinary influence and prestige. However, it remains unclear whether or not this latest "ism," with its appeal to our commodify-ing cult of the "new," will have been more than another passing intellectual fancy in what Fredric Jameson would call the academic marketplace under late capitalism. "The New Historicism" has not yet begun to fade from the academic scene, not is it quietly taking its place in the assortment of critical approaches on the interpreters' shelf. But neither has it become any clearer that "the New Historicism" designates any agreed-upon intellectual and institutional program. There has been no coalescence of the various identifiably New Historicist practices into a systematic and authoritative paradigm for the interpretation of Renaissance texts; nor does the emergence of such a paradigm seem either likely or desirable. What we are currently witnessing is the convergence of a variety of special interests upon "New Historicism," now constituted as a terminological site of intense debate and critique, of multiple appropriations and contestations within the ideological field of Renaissance studies itself, and to some extent in other areas of the discipline.

If Edward Pechter dubiously assimilates New Historicism to Marxism on the grounds that it insists upon the omnipresence of struggle as the motor of history, some self-identified Marxist critics are actively indicting New Historicism for its evasion of both political commitment and diachronic analysis - in effect, for its failure to be genuinely historical; while some female and male Renaissance scholars are fruitfully combining New Historicist and Feminist concerns, others are representing these projects (and/or their practitioners) as deeply antagonistic in gender-specific terms; while some see New Historicism as one of several modes of socio-criticism engaged in constructing a theoretically informed, post-structuralist problematic of historical study, others see it as aligned with a neo-pragmatist reaction against all forms of High Theory; if some see New Historicist preoccupations with ideology and social context as threatening to traditional critical concerns and literary values, others see a New Historicist delight in anecdote, narrative and what Clifford Geertz calls "thick description" as a will to construe all of culture as the domain of literary criticism - a text to be perpetually interpreted, an inexhaustible collection of stories from which curiosities may be culled and cleverly retold.⁷

Inhabiting the discursive spaces traversed by the term "New Historicism" are some of the most complex, persistent, and unsealing of the problems that professors of literature attempt variously to confront or to evade: Among them, the essential or historical bases upon which "literature" is to be distinguished from other discourses; the possible configurations of relationship between cultural practices and social, political, and economic processes; the consequences of post-structuralist theories of textuality for the practice of an historical or materialist criticism; the means by which subjectivity is socially constituted and constrained; the processes by which ideologies are produced and sustained, and by which they may be contested; the patterns of consonance and contradiction among the values and interests of a given individual, as these are actualized in the shifting conjunctures of various subject positions - as, for

example, intellectual worker, academic professional, and gendered domestic, social, political and economic agent. My point is not that "the New Historicism" as a definable project, or the work of specific individuals identified by themselves or by others as New Historicists, can necessarily provide even provisional answers to such questions, but rather that the term "New Historicism" is currently being invoked in order to bring such issues into play and to stake out - or to hunt down - specific positions within the discursive spaces mapped by these issues.

The post-structuralist orientation to history now emerging in literary studies may be characterized chiasmically, as a reciprocal concern with the historicity of texts and the textuality of history. By the historicity of texts, I mean to suggest the cultural specificity, the social embedment, of all modes of writing - not only the texts that critics study but also the texts in which we study them. By the textuality of history, I mean to suggest, firstly, that we can have no access to a full and authentic past, a lived material existence, unmediated by the surviving textual traces of the society in question - traces whose survival we cannot assume to be merely contingent but must rather presume to be at least partially consequent upon complex and subtle social processes of preservation and effacement; and secondly, that those textual traces are themselves subject to subsequent textual mediations when they are construed as the "documents" upon which historians ground their own texts, called "histories." As Hayden White has forcefully reminded us, such textual histories necessarily but always incompletely constitute in their narrative and rhetorical forms the "History" to which they offer access. ...

"The Historicity of Texts and the Textuality of History": If such chiasmic formulations are in fashion now, when the concept of referentiality has become so vexed, it may be because they figure forth from within discourse itself the model of a dynamic, unstable, and reciprocal relationship between the discursive and material domains. This refiguring of the relationship between the verbal and the social, between the text and the world, involves a re-problematization or wholesale rejection of some prevalent alternative conceptions of literature: As an autonomous aesthetic order that transcends the shifting pressure and particularity of material needs and interests; as a collection of inert discursive records of "real events"; as a superstructural reflexion of an economic base. Current practices emphasize both the relative autonomy of specific discourses and their capacity to impact upon the social formation, to make things happen by shaping the subjectivities of social beings. Thus, to speak of the social production of "literature" or of any particular text is to signify not only that it is socially produced but also that it is socially productive - that it is the product of work and that it performs work in the process of being written, enacted, or read. Recent theories of textuality have argued persuasively that the referent of a linguistic sign cannot be fixed; that the meaning of a text cannot be stabilized. At the same time, writing and reading are always historically and socially determinate events, performed in the world and upon the world by gendered individual and collective human agents. We may simultaneously acknowledge the theoretical indeterminacy of the signifying process and the historical specificity of discursive practices - acts of speaking, writing, and interpreting. The project of a new socio-historical criticism is, then, to analyze the interplay of culture-specific discursive practices - mindful that it, too, is such a practice and so participates in the interplay it seeks to analyze. By such means, versions of the Real, of History, are instantiated, deployed, reproduced; and by such means, they may also be appropriated, contested, transformed.

Notes

- 1 J. Hillis Miller, "Presidential Address 1986. The Triumph of Theory, the Resistance to Reading, and the Question of the Material Base," *PMLA* 102 (1987), pp. 281-91; p. 283.
- 2 Jacques Derrida, "But, beyond ... (Open Letter to Anne McClintock and Rob Nixon)," trans. Peggy Kamuf, *Critical Inquiry* 13 (1986), pp. 155-70; p. 168.
- 3 For a concise history of the term "ideology," see Raymond Williams, *Marxism and Literature* (Oxford: Oxford University Press, 1977), pp. 55-71. Of central importance for the sense of "ideology" I am using here is the essay on "Ideology and Ideological State Apparatuses" in Louis Althusser, *Lenin and Philosophy and Other Essays*, trans. Ben Brewster (New York and London: Monthly Review Press, 1971), pp. 127-86. According to Althusser's well-known formulation, "Ideology is a 'Representation' of the Imaginary Relationship of Individuals to their Real Conditions of Existence," which "Interpellates Individuals as Subjects" (pp. 162, 170). Althusser's theories of Ideology and the Subject have provoked considerable commentary and criticism, notably for appearing to disallow human agency in the making of history. On this debate, with special reference to the anti-Althusserian polemic of E. P. Thompson, see Perry Anderson, *Arguments Within English Marxism* (London: Verso, 1980), pp. 15-58.

A concise clarification of relevant terms is provided in Paul Smith, *Discerning the Subject* (Minneapolis: University of Minnesota Press, 1988) - which was published too late for me to have made more use of it here:

"The individual" will be understood here as simply the illusion of whole and coherent personal organization, or as the misleading description of the imaginary ground on which different subject-positions are colligated.

And thence the commonly used term "subject" will be broken down and will be understood as the term inaccurately used to describe what is actually the series of the conglomeration of *positions*, subject-positions, provisional and not necessarily indefeasible, into which a person is called momentarily by the discourses and the world that he/she inhabits.

The term "agent," by contrast, will be used to mark the idea of a form of subjectivity where, by virtue of the contradictions and disturbances in and among subject-positions, the possibility (indeed, the actuality) of resistance to ideological pressure is allowed for (even though that resistance too must be produced in an ideological context), (p. xxxv)

- 4 Edward Pechter, "The New Historicism and Its Discontents: Politicizing Renaissance Drama," *PMLA* 102 (1987), pp. 292-303; p. 292.
- 5 Louis Montrose, "Renaissance Literary Studies and the Subject of History," *English Literary Renaissance* 16 (1986), pp. 5-12. Much of that essay is subsumed and reworked in the present one. My thanks to Arthur Kinney, Editor of *ELR*, for permission to reprint previously published material; and to Roxanne Klein for her continuing encouragement and advice.
- 6 The term "New Historicism" seems to have been introduced into Renaissance studies (with reference to cultural semiotics) in Michael McCanles, "The Authentic Discourse of the Renaissance," *Diacritics* 10: 1 (Spring 1980), 77-87. However, it seems to have gained currency from its use by Stephen Greenblatt in his brief, programmatic introduction to "The Forms of Power and the Power of Forms in the Renaissance," a special issue of *Genre* (15, 1-2 [1982], pp. 1-4). Earlier, in the Introduction to *Renaissance Self-Fashioning* (Chicago: University of Chicago Press, 1980), Greenblatt had called his project a "cultural poetics." He has returned to this term in the introductory chapter of his recent book, *Shakespearean Negotiations: The Circulation of Social Energy in Renaissance England* (Berkeley and Los Angeles: University of California Press, 1988). Here he defines the enterprise of cultural poetics as the "study of the collective making of distinct cultural practices and inquiry into the relations among these practices"; the relevant concerns are "how collective beliefs and experiences were shaped, moved from one medium to another, concentrated in manageable aesthetic form, offered for consumption [and] how the boundaries were marked between cultural practices understood to be art forms and

other, contiguous, forms of expression" (p. 5). I discuss the relevance of anthropological theory and ethnographic practice - specifically, the work of Clifford Geertz - to the study of early modern English culture in my review essay on *Renaissance Self-Fashioning: "A Poetics of Renaissance Culture," Criticism* 23 (1981), pp. 349-59.
